SOUNDTRANSIT

June 7, 2024

Dear Recipient:

The U.S. Department of Transportation Federal Transit Administration (FTA) and Sound Transit (the Central Puget Sound Regional Transit Authority) have prepared this Final Environmental Impact Statement (EIS) on the proposed Operations and Maintenance Facility (OMF) South project. The OMF South would receive, test, commission, store, maintain, and deploy light rail vehicles as part of Sound Transit's Link light rail system expansion. FTA is the National Environmental Policy Act (NEPA) lead agency. Sound Transit is the project proponent and State Environmental Policy Act (SEPA) lead agency.

FTA and Sound Transit prepared this Final EIS pursuant to NEPA (42 United States Code 4321 et seq.) and SEPA (Chapter 43.21C Revised Code of Washington) to inform the public, agencies, and decision makers about the potential environmental impacts and benefits of building and operating the OMF South in the city of Kent or Federal Way, Washington.

The major choice for the project involves the location of a light rail OMF in the South corridor of the Link light rail system. The Sound Transit Board will consider the alternatives evaluated in the Final EIS, public and agency comments on the 2021 SEPA Draft EIS and 2023 NEPA Draft/SEPA Supplemental Draft EIS, and other information before selecting the project to be built. After the Sound Transit Board selects the project to be built, FTA will issue a Record of Decision, which will state FTA's decision on the project and list Sound Transit's mitigation commitments to reduce or avoid impacts.

Enclosed is an Executive Summary of the Final EIS. The full EIS and separately bound appendices and technical reports are available online at: https://www.soundtransit.org/system-expansion/operations-maintenance-facility-south/documents. Please see the Fact Sheet of this Executive Summary regarding how to obtain hard copies and who to contact for further information on the Final EIS.

Sincerely,

Erin Green

Erin Green
Environmental Manager, South Corridor

Operations and Maintenance Facility South Final Environmental Impact Statement

National Environmental Policy Act (NEPA) lead agency: Federal Transit Administration

State Environmental Policy Act (SEPA) lead agency: Central Puget Sound Regional Transit Authority (Sound Transit)

Cooperating agencies: Federal Highway Administration, U.S. Army Corps of Engineers, U.S. Environmental Protection Agency, Washington State Department of Transportation, City of Federal Way, City of Kent

Abstract: The Central Puget Sound Regional Transit Authority (Sound Transit) proposes to construct and operate a Link light rail operations and maintenance facility in its South Corridor (OMF South). The facility would meet agency needs for an expanded fleet of light rail vehicles (LRVs). The need to expand LRV maintenance capacity was identified in Sound Transit 3: The Regional Transit System Plan for Central Puget Sound. OMF South would be used to store, maintain, and deploy about 144 LRVs for daily service. It would provide facilities for vehicle storage, inspections, maintenance and repair, interior vehicle cleaning, and exterior vehicle washing. Additionally, the facility would receive, test, and commission new LRVs for the entire Link light rail system.

This Final Environmental Impact Statement (EIS) considers three site alternatives in King County, Washington for the OMF South: two in the City of Federal Way and one in the City of Kent. These alternatives are named the South 336th Street Alternative, South 344th Street Alternative, and Midway Landfill Alternative. The Sound Transit Board of Directors identified the South 336th Street Alternative as the Preferred Alternative.

FTA and Sound Transit are issuing this Final EIS as a joint document under the National Environmental Policy Act (NEPA) (42 United States Code 4321 et seq.) and the Washington State Environmental Policy Act (SEPA) (Chapter 43.21C Revised Code of Washington). This Final EIS analyzes the OMF South project environmental effects and responds to comments received on the March 2021 SEPA Draft EIS and September 2023 NEPA Draft/SEPA Supplemental Draft EIS.

NEPA review period ends: July 8, 2024

Estimated EIS Cost
Pursuant to 40 CFR 1502.11, the estimated cost to prepare both the draft and final environmental impact statement is $118,916.

Tribal Acknowledgement

As we plan and build one of the largest transit expansions in North America, which includes the first light rail transit extensions on reservation lands in the history of the United States, we would like to acknowledge the people who have been here since time immemorial: the Puyallup Tribe of Indians, the Muckleshoot Indian Tribe, the Nisqually Indian Tribe, the Suquamish Tribe, the Squaxin Island Tribe, the Snoqualmie Indian Tribe, and the Confederated Tribes and Bands of the Yakama Nation. We would like to thank each Tribe for their partnership.

Fact Sheet

Project Title

Operations and Maintenance Facility South (OMF South)

Proposed Action

The Central Puget Sound Regional Transit Authority (Sound Transit) proposes to construct and operate a Link light rail operations and maintenance facility in its South Corridor (OMF South). The facility would meet agency needs for an expanded fleet of light rail vehicles (LRVs). The need to expand LRV maintenance capacity was identified in Sound Transit 3: The Regional Transit System Plan for Central Puget Sound (Sound Transit 3). OMF South would be used to store, maintain, and deploy about 144 LRVs for daily service. It would provide facilities for vehicle storage, inspections, maintenance and repair, interior vehicle cleaning, and exterior vehicle washing. Additionally, the facility would receive, test, and commission new LRVs for the entire Link light rail system. OMF South would create high-skilled, living-wage jobs for more than 610 people in south King County.

OMF South would include three primary buildings: the Operations and Maintenance Facility (OMF) building, Maintenance of Way (MOW) building, and the Link System-Wide Storage building. The OMF building includes service lanes for vehicle maintenance, repair, carwash, cleaning, painting, spare parts storage, operations, and administration. The MOW building includes areas for maintenance and storage of spare parts for tracks, vehicle propulsion equipment, train signals, and other infrastructure. The Link System-Wide Storage building includes areas for receiving and storing all parts for the Link light rail system. The buildings could include offices, locker rooms, lunchrooms, and other spaces for employees.

OMF South would include runaround tracks to maneuver vehicles, storage tracks, a yard area for outside storage, a training track, traction power substations, and parking for employees, visitors, and nonrevenue vehicles. Additionally, OMF South would need to have tracks connecting it to an operating light rail line when the facility opens. In southern King County the OMF will need to connect to the Federal Way Link Extension (FWLE). The length and location of these connecting tracks varies by site alternative.

Three site alternatives for the proposed project are evaluated in this Final Environmental Impact Statement (EIS): two in the city of Federal Way and one in the city of Kent. These alternatives are named the South 336th Street Alternative, South 344th Street Alternative, and Midway Landfill Alternative, respectively. The Sound Transit Board of Directors (the Board) identified the South 336th Street Alternative as the Preferred Alternative for evaluation in the EIS.

Depending on the alternative and resulting environmental impacts, the project also includes minimization and mitigation measures that address potential impacts to visual and aesthetic resources, noise, and ecosystem resources. Refinements to mitigation measures will continue through final design.

Dates of Construction and Opening

Final design and construction are scheduled to begin later in 2024. The forecasted in-service date is between 2032 and 2037, depending on the alternative selected to be built. However, project realignment (Resolution R2021-05), influenced by the COVID-19 pandemic and increased project cost estimates, may have an impact on the future project schedule. OMF South is a Tier 1 project, which means Sound Transit will continue to develop it for construction, and it will be managed under more ambitious schedule completion targets.

Environmental Process

This Final EIS is a joint document issued under the National Environmental Policy Act (NEPA) (42 United States Code [USC] § 4321) and the Washington State Environmental Policy Act (SEPA) (Revised Code of Washington [RCW] 43.21.C.030 and Chapter 197-11 of the Washington Administrative Code [WAC]). The Federal Transit Administration (FTA) is the lead agency under NEPA and Sound Transit is the lead agency under SEPA. As described in more detail below, this Final EIS responds to comments received on both the March 2021 SEPA Draft EIS and September 2023 NEPA Draft/SEPA Supplemental Draft EIS.

Utility Approvals: Easements and Use Agreements	Utility Providers

Note: Not all permits would be needed for every alternative.

Next Steps

Following issuance of the Final EIS, the Sound Transit Board of Directors will make a final decision on the alternative to be built. FTA will then issue a Record of Decision (ROD) no sooner than 30 days after publication of the Final EIS. The ROD will describe the project Sound Transit would build along with measures to avoid, minimize, and mitigate environmental impacts.

Because SEPA requires that the Sound Transit Board's final decision on the project be informed by the Final EIS, the Final EIS must be issued independently of the ROD so that Sound Transit's decision can later be incorporated into the ROD. As a result of these regulatory requirements under SEPA, it is not practical to issue a combined Final EIS and ROD, and they are being issued as separate documents.

Cost and Availability of Final Environmental Impact Statement

The Final EIS is available for public review in a variety of formats and locations. It is available on the Sound Transit website: www.soundtransit.org/system-expansion/operations-maintenance-facility-south/documents. Paper copies are available for the cost listed below, which is below the cost of reproduction:

- Executive Summary - Free
- EIS - $25.00
- Technical Reports and other appendices - $15.00 each

To request paper copies or a flash drive of the documents, please contact Dominique Jones at (206) 689-4783 or email dominique.jones@soundtransit.org.

Paper copies are also available for review at the following locations:

- Sound Transit offices, Union Station, 401 South Jackson Street, Seattle (please call the Sound Transit librarian at (206) 398-5344 weekdays from 8:00 a.m. to 5:00 p.m. to arrange an appointment)
- Federal Way City Hall, 33325 8th Avenue S, Federal Way
- Federal Way Library, 34200 1st Way S, Federal Way
- Federal Way 320th Library, 848 S 320th St, Federal Way
- Federal Way Community Center, 876 S 333rd Street, Federal Way
- Kent Library, 212 2nd Ave N, Kent
- Kent Commons Community Center, 525 4th Ave N, Kent
- Kent City Hall, 220 4th Avenue S, Kent

Appeals

SEPA challenges to this Final EIS are governed by Sound Transit Resolution R7-1 and the Washington State SEPA rules and regulations (Chapter 43.21 RCW and WAC 197-11-680).

As provided in Resolution R2018-17, appeals of SEPA determinations must be made in writing by filing a letter of appeal and paying the required fee within 14 days following the date the environmental document is issued under SEPA. Letters of appeal should be addressed to:

Goran Sparrman, Interim Chief Executive Officer
Sound Transit
401 S Jackson Street
Seattle, Washington 98104

Appeals must be received by Sound Transit on or before 5:00 p.m. on June 21, 2024. Additional details about the appeals process and requirements are set out in Resolution R2018-17 and in the SEPA rules and regulations.

SOUND TRANSIT

Introduction

The Central Puget Sound Regional Transit Authority (Sound Transit) proposes to build and operate a Link light rail operations and maintenance facility in its South Corridor (OMF South). The facility would meet agency needs for an expanded fleet of light rail vehicles (LRVs). OMF South would support the expansion of the Link light rail system as part of Sound Transit 3: The Regional Transit System Plan for Central Puget Sound (Sound Transit 3). Under Sound Transit 3, the Link light rail system in central Puget Sound would grow to 116 miles with over 80 stations.

The system would expand north to Everett, south to Federal Way and Tacoma, east to Redmond, south Kirkland, and Issaquah, and west to West Seattle and Ballard by 2042 as shown in Figure ES-1. Sound Transit 3 calls for a total fleet of approximately 460 LRVs. To meet the system expansion goals, Sound Transit needs two additional operations and maintenance facilities: one each in the North and South Corridors. While OMF South would be in the South Corridor, it would support Sound Transit's system-wide expansion by providing a facility to receive, test, commission, store, maintain, and deploy an increased LRV fleet for the entire Link light rail system.

Environmental Planning and NEPA/SEPA Coordination

The environmental process for OMF South began in April 2018 with an early scoping period under the Washington State Environmental Policy Act (SEPA) to inform the alternatives development process. At that time, the environmental review process was conducted in compliance with SEPA only. Under SEPA, key environmental milestones were completed, including alternatives development as part of the scoping process and issuance of a SEPA Draft Environmental Impact Statement (EIS) in March 2021. After considering the SEPA Draft EIS and the comments received, the Sound Transit Board of Directors identified the South 336th Street Alternative as the Preferred Alternative for further evaluation in the SEPA Final EIS (Motion M2021-81, December 2021).

Subsequently, the design for the Preferred Alternative was advanced and modified in response to comments received during the 2021 SEPA Draft EIS comment period. A test track was added to the Preferred and South 344th Street alternatives to meet additional operational needs. Additionally, the Federal Transit Administration (FTA) and Sound Transit determined the need for an EIS under NEPA to support federal funding and approvals. With FTA as the NEPA lead agency, a NEPA Draft/SEPA Supplemental Draft EIS was issued September 22, 2023.

FTA and Sound Transit prepared this Final EIS. It evaluates three build alternatives that meet the purpose and need for the proposed project, as described below. These three alternatives are the South 336th Street (Preferred) Alternative in Federal Way, the South 344th Street Alternative in Federal Way, and the Midway Landfill Alternative in Kent, shown in Figure ES-2.

Figure ES-1: Link Light Rail System Expansion

The EIS also evaluates a No Build Alternative, which considers how the transit system would operate if the proposed project were not built. The No Build Alternative provides a baseline against which to measure the impacts of the build alternatives.

The discussion that follows states the proposed project's purpose and need, compares the levels of impact that would result from each build alternative, and describes design features and measures that would avoid, reduce, or mitigate impacts. Sound Transit's goal is to preserve and promote a healthy and sustainable environment by minimizing adverse impacts to people and the natural and built environments. The methodologies used to evaluate impacts are generally described in the introduction to each subsection of Chapter 3 in the Final EIS.

Final design and construction of the project are scheduled to begin later in 2024. The forecasted in-service date is between 2032 and 2037, depending on the alternative selected to be built. However, this schedule could change, resulting in a delayed opening or the construction of OMF South in phases to reach full operational capacity over time.

Figure ES-2: Project Alternatives

ES.1 Purpose and Need

The purpose of the OMF South project is to:

- Provide a facility with the capacity to receive, test, commission, store, maintain, and deploy vehicles to support the intended level of service for the system-wide Link light rail expansion.
- Support efficient and reliable light rail service that minimizes system operating costs.
- Support and connect efficiently to the regional system and be technically and financially feasible to build, operate, and maintain, consistent with the Sound Transit 3 Plan and the Sound Transit Regional Transit Long-Range Plan.

The project is needed because:

- The current regional system lacks a facility with sufficient capacity and suitable location to support the efficient and reliable long-term operations for system-wide Link light rail expansion, including the next phase of expansion in King and Pierce counties.
- New light rail maintenance and storage capacity needs to be available with sufficient time to accept delivery of and commission new vehicles to meet the expansion needs outlined in Sound Transit 3 and to store existing vehicles while the new vehicles are tested and prepared.

The OMF South project is necessary to support the addition of approximately 144 LRVs as part of the Sound Transit 3 system expansion. The final number of light rail vehicles maintained in this location will be determined in the Rail Fleet Management Plan update, currently underway by Sound Transit. The facility includes functions that support the entire Link light rail system, such as receiving, testing, and commissioning new LRVs. In addition, OMF South would include Maintenance of Way (MOW) facilities and a Link System-Wide Storage building to receive and store vehicle parts and components, tracks and components, and station parts and components.

ES.2 Alternatives Considered

The OMF South alternatives underwent an extensive evaluation process prior to their identification for study in the EIS. Beginning in early 2018, Sound Transit conducted early scoping under SEPA, followed by alternatives development, including site identification, prescreening, and alternatives evaluation. In early 2019, six alternatives were presented to the public during the SEPA scoping period, and in May 2019 the Board identified three alternatives for evaluation in the SEPA Draft EIS. These three alternatives were the South 336th Street Alternative in Federal Way, the South 344th Street Alternative in Federal Way, and the Midway Landfill Alternative in Kent.

The SEPA Draft EIS was published in March 2021 and had a public comment period extending from March 5 to April 19, 2021. After considering the SEPA Draft EIS and the comments received from Tribes, agencies, and the public, the Board identified the South 336th Street Alternative as the Preferred Alternative for further study in the SEPA Final EIS (Motion M2021 81; December 2021).

No-Build Alternative

The No Build Alternative evaluates how the transit system would operate if the proposed project were not built. It assumes that the other Link light rail system improvements listed in Sound Transit 3 would be built, including extensions to West Seattle, Ballard, Issaquah, and Tacoma. The No Build Alternative also assumes that the new North Corridor OMF would be constructed. Under the target schedule for Sound Transit's System Expansion Plan, each of these projects would be constructed and operational by 2042.

The analysis of the No Build Alternative is based on the expected conditions in 2042, which is the future design year for the project. Due to the realigned capital program (Resolution R2021 05, August 2021) completion of some Sound Transit 3 projects may be delayed past 2042; however, 2042 provides a common future analysis year for ridership forecasting, air, noise, transportation, and other environmental elements on all Sound Transit 3 projects.

Under the No-Build Alternative, impacts from the Sound Transit 3 projects listed above, including Federal Way Link Extension (FWLE), Tacoma Dome Link Extension (TDLE), West Seattle Link Extension (WSLE), and other reasonably foreseeable future actions by others would still occur. As the FWLE and TDLE projects are within the study areas for the OMF South project alternatives, there are impacts that may be similar to or that overlap with those of OMF South. FWLE is under construction with a forecasted in-service date of 2026. The impacts of FWLE have been addressed in the Federal Way Link Extension Final Environmental Impact Statement. TDLE is currently undergoing environmental review under both NEPA and SEPA by FTA and Sound Transit. The Tacoma Dome Link Extension Draft Environmental Impact Statement is expected to be published in mid 2024, with a forecasted in-service date of 2035.

Affordable and Target Schedules

Due to steeply rising real estate prices and other construction expenses, Sound Transit projects currently in early planning and design, including OMF South, are seeing cost estimate increases. To ensure that funding remains available to complete all voter-approved projects, the Sound Transit Board conducted a "realignment" process that established the following two schedules:

Affordable Schedule: a schedule that is affordable, using current financial projections and cost estimates to set the general order in which projects will advance. This "affordable" schedule established an approach to prioritize, fund, and manage program work over time (Resolution 2021-05).

Target Schedule: schedule for priority projects, as close to Sound Transit 3 Plan schedules as possible, reliant upon reductions in the affordability gap through cost savings and additional revenue.

Under all currently proposed build alternatives for TDLE, the TDLE mainline tracks south of Federal Way Downtown Station would also serve as part of connecting mainline tracks to OMF South, depending on which OMF South build alternative is selected. If TDLE is constructed as proposed, impacts from the mainline tracks would be primarily the same under both the No Build and build alternatives for OMF South, although the timing of those impacts would be different. TDLE impacts will be further detailed in the separate Tacoma Dome Link Extension Draft Environmental Impact Statement.

The No Build Alternative assumes Sound Transit's Link light rail storage and maintenance facilities (including OMF North) would support a maximum Link light rail fleet size of about 352 LRVs, which is fewer than the approximately 460 LRVs needed to operate the system at the planned service levels of Sound Transit 3. As a result, Link light rail operations would be less efficient than they would otherwise be with OMF South, and Sound Transit would not be able to meet expected ridership demand. As documented in Sound Transit 3, the

No Build Alternative would fail to meet the purpose and need of the project and could indirectly result in worse traffic congestion and greater vehicle emissions than would otherwise occur under the build alternatives by failing to support intended levels of service for the system-wide Link light rail expansion.

Build Alternatives

Build alternatives evaluated in this document include the South 336th Street Alternative (the Preferred Alternative), the South 344th Street Alternative, and the Midway Landfill Alternative. The basic design and function of the OMF South site would be the same for all alternatives. The primary differences between the three build alternatives include their geographic location and that the Preferred and South 344th Street alternatives include mainline connecting tracks and a test track.

Several separate operational functions are proposed for the OMF South site. These functions would be the same for all build alternatives. Each alternative would include a 2 story OMF building, a 1-story MOW building, a 1-story Link System-Wide Storage building, storage tracks, yard areas, and parking spaces (including accessible parking) for employees, visitors, and nonrevenue Sound Transit vehicles. The site would include space for receiving, testing, commissioning, storing, maintaining, and deploying approximately 144 LRVs in addition to housing administrative and operational functions, such as serving as a report base for operators. OMF South would include administration, workshop, and storage space for MOW and Facilities staff and functions. There would be a training track that would include all the track installation configurations found in the Link system. Currently, storage is provided at existing OMF sites and at locations outside of these sites. OMF South's Link System-Wide Storage building is intended to centralize the receiving, distribution and storage needs and would minimize the need for storage in locations outside of currently owned properties.

Track Types

Mainline Tracks: Tracks that are used for LRVs or are the principal artery of a system to which other components (such as operation and maintenance facilities) are connected. Mainline tracks can be elevated (on a structure) or at-grade (on the ground surface).

Tail Track: A track at the end of the mainline that can be used for storing a train.

Test Track: A dedicated track to allow LRVs to be tested without using the mainline tracks.

Lead Track: A track connecting a railroad yard or facility with mainline tracks.

Training Track: A short length of track located within the OMF site that includes all the track installation configurations found in the Link system.

For the purposes of analysis, mainline tracks, tail tracks, and the test track are included with the mainline; lead tracks and the training track are included with the OMF site.

The OMF South facility needs to connect to the Link light rail system via an operating mainline. The Preferred and South 344th Street alternatives are approximately 1 mile south of the FWLE terminus at the Federal Way Downtown Station and would require construction of mainline tracks to connect the OMF South facility to FWLE. The Midway Landfill Alternative is adjacent to the FWLE alignment and would connect directly to the mainline tracks.

Design Updates to the Preferred and South 344th Street Alternatives

After publication of the 2021 SEPA Draft EIS, Sound Transit updated design elements of the alternatives to reflect public comments on the SEPA Draft EIS, coordination with local jurisdictions, and operational needs. Design updates are described below and in Chapter 2, Alternatives Considered, of the Final EIS.

Updated design elements of the Preferred Alternative and South 344th Street alternatives include the following:

- Addition of a third track parallel to the mainline tracks to serve as a dedicated test track to test new and rehabilitated LRVs to ensure their safety, compliance with Sound Transit's requirements, and readiness to carry passengers. For the Midway Landfill Alternative, this testing would continue to be conducted on the mainline tracks.

Updated design elements of the Preferred Alternative include the following:

- The main site entrance has been moved from State Route (SR) 99 to S 341st Place.
- 18th Place S has been extended to connect S 340th Street and S 336th Street as a replacement for the removal of 20th Avenue S. The extended street would include a bike/pedestrian trail to provide public amenities.
- 21st Avenue S has been extended to connect to S 344th Street.
- Frontage improvements (including road widening) have been added on the south side of S 336th Street to meet city requirements.
- The OMF South site has been expanded to the southwest to provide more space for buildings and yard area.
- The OMF South site and internal track configuration has been modified to a parallelogram to allow for a wider stream and wetland corridor on the east side of the OMF, between the site and Interstate 5 (I-5).
- Existing culverts that carry the West Fork Hylebos Creek Tributary under S 336th Street and the East Fork Hylebos Creek Tributary under S 344th Street are planned to be upgraded, removed, and/or relocated to meet state fish passage requirements.

Design of the Preferred Alternative is likely to continue to evolve as Sound Transit works to minimize and mitigate environmental impacts.

Preferred Alternative

The Preferred Alternative is in Federal Way between S 336th Street and S 341st Place and between I-5 and SR 99. The Preferred Alternative represents the Board's preference based on information currently available. Identifying a Preferred Alternative assists the public in reviewing the environmental documents. The selection of the alternative to be built will be made by the Board after the Final EIS is issued.

Mainline Tracks

The Preferred Alternative would require approximately 1.4 miles of connecting mainline tracks from the southern terminus of FWLE (see Figure ES-3). If TDLE is constructed as proposed, LRVs providing passenger service would operate on these mainline tracks. TDLE is currently undergoing a separate environmental review.

There are two alignment options for this length of mainline tracks: the 40 mph Alignment and 55 mph Design Option, which differ near their connection to the FWLE terminus. The mainline tracks would be elevated, with north-bound and south-bound tracks. The tracks would extend south approximately 1,000 feet past the southeast corner of the OMF South site, at that point serving as tail tracks. These elevated tail tracks would be used to allow trains to access the Link system from the south if the northern lead tracks were out of service.

A test track would run parallel to the east side of the mainline tracks from S 324th Street to just south of S 336th Street — approximately 0.9 mile. The test track would be at the same elevation as the mainline tracks, with the exception of the north end of the track near S 324th Street, where the mainline tracks would be elevated, and the test track would be at grade.

OMF South Site

The Preferred Alternative site footprint is approximately 66 acres, which includes three primary buildings, storage tracks, a training track, yard areas, and approximately 480 parking spaces. The yard area would be approximately 6.7 acres. Figure ES-4 is an aerial view with a conceptual layout. The Preferred Alternative would also include extensions of 18th Place S and 21st Avenue S.

In addition to the mainline tracks, the site would also require lead tracks to access the rail system. Elevated lead tracks would leave the northeast corner of the site and be approximately 800 feet long. Similarly, a pair of elevated lead tracks approximately 1,000 feet long would leave the southeast corner of the site to access the mainline tail tracks. If the Preferred Alternative is selected, Sound Transit would continue to explore site designs to minimize ecosystem impacts, which could include modifying the locations of buildings, track, and 18th Place South within the site boundaries.

Figure ES-4: Conceptual Layout: Preferred Alternative

South 344th Street Alternative

The South 344th Street Alternative is in Federal Way between S 336th Street and S 344th Street and between I-5 and 18th Place S.

Mainline Tracks

The South 344th Street Alternative would require approximately 1.8 miles of connecting mainline tracks from the southern terminus of the FWLE project to the site (see Figure ES-3). As with the Preferred Alternative, these tracks would serve as future mainline tracks for LRV passenger service if TDLE is constructed as proposed. The test track and mainline alignment options are the same as described for the Preferred Alternative in the section above and shown in Figure ES-5.

As with the Preferred Alternative, the mainline tracks would extend past the southeast corner of the OMF South site to serve as tail tracks. These tail tracks would be used to allow trains to access the Link system from the south if the northern lead tracks are out of service. There are two options for the South 344th Street Alternative tail tracks that follow the design alternatives for TDLE: the Enchanted Parkway alignment and the I-5 alignment. Both options are completely elevated, with the Enchanted Parkway alignment extending approximately 1,100 feet south of the site and the I-5 alignment extending approximately 1,400 feet south of the site.

OMF South Site

The South 344th Street Alternative site footprint is approximately 64 acres, which includes buildings, storage tracks, a training track, yard areas, and approximately 480 parking spaces. The yard area would be approximately 8.2 acres. Figure ES-5 is an aerial view with a conceptual layout.

In addition to the mainline connecting tracks, the site would also require lead tracks to access the rail system. The elevated lead tracks would leave the northeast corner of the site and be approximately 1,100 feet long. Similarly, a set of approximately 1,600 feet of elevated lead tracks would leave the southeast corner of the site to connect to the mainline tail tracks for the Enchanted Parkway alignment; approximately 1,300 feet of elevated lead tracks would be needed to connect the site to the mainline tail tracks for the I-5 alignment.

Figure ES-5: Conceptual Layout: South 344th Street Alternative

Midway Landfill Alternative

The Midway Landfill Alternative is in Kent between S 246th Street and S 252nd Street and between I-5 and SR 99.

Mainline

Because the site would be located adjacent to FWLE, which has a forecasted in-service date of 2026, there would be no need to build additional mainline tracks.

OMF South Site

The site footprint of the Midway Landfill Alternative is approximately 68 acres, which includes buildings, storage tracks, a training track, yard areas, and approximately 480 parking spaces. The yard area encompasses approximately 8.3 acres. Figure ES-6 is an aerial view with a conceptual site layout.

The Midway Landfill Alternative would connect to the mainline tracks via a series of lead tracks between the Kent/Des Moines and South 272nd Street stations. An approximately 3,200 foot long lead track would run parallel to the FWLE mainline tracks, and five shorter (approximately 400 foot-long) lead tracks would connect it to the site. The lead track parallel to FWLE would be elevated for approximately 35 percent of its length; the shorter lead tracks would be primarily at grade.

Midway Landfill Alternative Subsurface Construction Design Options

The Midway Landfill site is a publicly owned, mostly vacant site along the FWLE. However, there are unique risks involved with building on a former landfill that is under active Superfund site monitoring and reporting requirements. A Superfund site is a location contaminated by hazardous waste that has been designated by the U.S. Environmental Protection Agency (EPA) for management and cleanup. In addition, waste in the landfill is settling at different rates across the site, which poses long-term operations and maintenance concerns. After a series of workshops and further analysis to address this settlement concern, Sound Transit developed three subsurface construction design options for building an OMF on the landfill: Platform, Hybrid, and Full Excavation.

Under the Platform subsurface construction design option, OMF South would be built on a 3.5 foot-thick concrete slab platform supported on approximately 700 concrete-filled drilled shafts. The drilled shafts would be 10 feet in diameter, distributed on a 35-foot by 70-foot grid under the buildings, track, and drainage vault area. Average shaft depths would range from 120 feet to 180 feet below finished grade. Due to the number of drilled shafts, the entire soil and geomembrane cap system that overlays the landfill would be removed then replaced after the shafts had been installed. The platform would then be constructed on top of the new cap, which would be designed to meet the regulatory requirements for the remedial controls to contain the landfill waste and hazardous emissions and to prevent precipitation from reaching the buried refuse where it could contaminate groundwater.

Figure ES-6: Conceptual Layout: Midway Landfill Alternative

Under the Hybrid subsurface construction design option, the entire landfill cap system would also be removed and replaced. Approximately 4.3 million cubic yards of loose landfill material beneath the cap would be excavated, and the remaining fill would undergo a ground improvement process called deep dynamic compaction to prepare the site for construction. Excavated material would be screened to determine whether it was suitable for reuse. A 1 foot thick concrete slab over a 3-foot-thick beam system would be built to support facilities sensitive to settlement, including tracks, parking, and roads. Approximately 110 concrete-filled drilled shafts would provide additional support where needed under buildings. Approximately 1.2 million cubic yards of suitable soil would need to be brought to the site.

The Full Excavation subsurface construction design option would completely excavate the landfill, screen excavated material for reuse, and backfill with soil that the OMF would be built on. The landfill cap system would also be removed and replaced to cover the reused landfill material. Excavation of the landfill would produce approximately 4.9 million cubic yards of loose material consisting of solid waste and soil, of which approximately 3 million cubic yards would be hauled off site. The hauled off material would be the equivalent of about 920 Olympic-sized swimming pools. Approximately 1.6 million cubic yards of suitable soil would be imported to the site.

Construction Approach for the Build Alternatives

Major construction activities would start with demolishing existing buildings, relocating utilities, and grading and excavating the site, which may include construction of retaining walls. The next phase of construction would include installing track work and electrical systems (overhead catenary system power lines, traction power substations [TPSS], etc.) and constructing the OMF South buildings.

Typical construction would occur on a 5- to 6-day workweek schedule, primarily during daytime hours. In some situations (such as when street detours are involved or when daytime construction periods need to be shortened to reduce impacts), additional shifts, all-week, nighttime, or 24-hour construction activities could be necessary.

Opinion of Probable Cost

The opinion of probable cost is presented in ranges in Table ES-1. Cost estimates at this early phase of project development (approximately 10 percent design) are for comparative purposes only using a “Unit Cost Library” assembly methodology for cost estimating and do not represent the project budget. Sound Transit has developed high-level conceptual cost estimates for all alternatives evaluated in the Final EIS. A more detailed estimate is being developed for the Preferred Alternative as the project design advances and would continue to be refined for the alternative selected to be built, prior to final design. Sound Transit establishes a project budget when design has advanced and a project’s baseline budget and schedule is established prior to the start of construction.

ES.3 Comparison of Alternatives

Table ES-1 below summarizes key characteristics and long-term impacts (unless otherwise specified) that differentiate the build alternatives. There would be additional temporary impacts to these elements of the environment during construction that are not reflected in this table. Both long-term and construction impacts are discussed in detail in the Final EIS.

The OMF South build alternatives are anticipated to have similar impacts to many of the elements of the natural and built environment. However, there are some impacts and characteristics that distinguish the alternatives from each other.

Table ES-1: Key Characteristics and Impacts of the Build Alternatives

Key Characteristics and Impacts	Preferred Alternative[1]	South 344th Street Alternative[1]	Midway Landfill Alternative[2]
Opinion of Probable Cost (In 2023 dollars)[3, 4]			
Mainline[5]	$356 M to $449 M	$528 M to $695 M	N/A
OMF[6]	$1.5 B to $1.8 B	$1.5 B to $1.9 B	$2.1 B to $3.5 B
Total	***$1.9 B to $2.2 B***	***$2.0 B to $2.6 B***	***$2.1 B to $3.5 B***
Annual Operating Cost Estimate (In 2023 dollars)[4]			
Mainline[5]	$1.2 M	$1.5 M	N/A
OMF	$12 M	$12 M	$13 M
Total	***$13.2 M***	***$13.5 M***	***$13 M***

Complete Facility	***4y 8m***	***4y 9m***	***7y 6m to 10y***
Transportation			
Maximum anticipated daily truck trips during construction			
Mainline[5]	120	120	N/A
OMF Site[8]	45	77	71 to 564
Total	***165***	***197***	***71 to 564***

Notes:

[1] Ranges for the Preferred and South 344th Street alternatives reflect the two mainline alignment options (40 mph Alignment and 55 mph Design Option). For the purposes of analysis, the mainline also includes the test track and tail tracks.

[2] Ranges for the Midway Landfill Alternative reflect the three subsurface construction design options (Platform, Hybrid, and Full Excavation).

[3] Opinion of probable cost includes property acquisition, relocation assistance, final design, and construction.

[4] The unit costs used to develop the opinion of probable costs are based on costs from 2023. They do not account for future increases due to inflation.

[5] With the Midway Landfill Alternative, the mainline could be built later in time if TDLE is constructed as proposed. TDLE is currently under environmental review.

[6] There is potential increased cost risk due to the nature of the uncertain subsurface conditions at the landfill and the low level of design (10 percent) and subsurface exploration at this phase.

[7] Construction duration totals reflect the overlap of some site preparation and facility construction activities and rounding of months.

[8] Estimates represent a worst-case scenario during the site preparation phase and not a daily average of truck trips over the entire construction period.

Notes:

[1] Ranges for the Preferred and South 344th Street alternatives reflect the two mainline alignment options (40 mph Alignment and 55 mph Design Option). For the purposes of analysis, the mainline also includes the test track and tail tracks.

[2] Ranges for the Midway Landfill Alternative reflect the three subsurface construction design options (Platform, Hybrid, and Full Excavation).

[5] With the Midway Landfill Alternative, the mainline could be built later in time if TDLE is constructed as proposed. TDLE is currently under environmental review.

The current level of project design includes uncertainties regarding the project scope, engineering data, mitigation requirements, schedule, and project delivery methods. To account for these uncertainties, the Opinion of Probable Cost is provided in a range. These conceptual estimates focus on the project elements that are defined consistently across alternatives, that capture the essential physical features of alternatives, and that help distinguish alternatives from one another.

In addition to the "Unit Cost Library" cost estimate, Sound Transit completed a more detailed estimate, applying a "bottoms up" cost methodology for the Preferred Alternative. Preliminary information from this methodology indicates cost growth of 33 percent attributable to the change in estimating methodology, inflation factors, market conditions, design development, and scoping changes. Sound Transit anticipates that the South 344th Street and Midway Landfill alternatives would have a similar increase if a "bottoms up" cost methodology were applied to those alternatives. Capital projects across the Puget Sound region are experiencing the effects of inflationary factors including increases in the cost of materials and labor. Sound Transit employs Value Management evaluations and procurement strategies to establish final project budgets, supporting prudent expenditure of public funds. Each project estimate throughout the various design phases will therefore need to be evaluated and adjusted specifically considering current market conditions. This market conditions adjustment is independent of escalation and will fluctuate with economics and the value of any given project considered by the marketplace.

Estimates for annual operating costs include long-term expenses to maintain the facility, as well as operating costs associated with trains deploying from and returning to the OMF each day. Additionally, annual mainline track maintenance expenses for the Preferred and South 344th Street alternatives would apply until TDLE is completed.

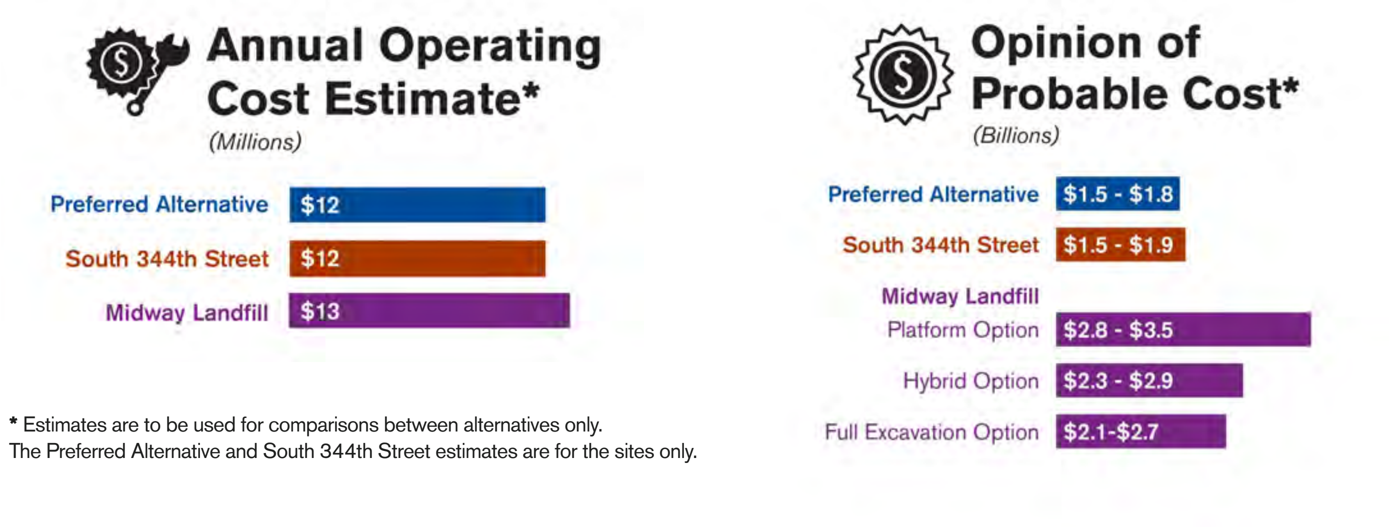
Construction Duration and Traffic

The Midway Landfill Alternative would require extensive preparation work to address site contamination and soil stability. As a result, the overall construction period (not including final design) is anticipated to range from 6 years, 2 months to 8 years, 8 months, depending on the subsurface construction design option chosen, which is nearly double to more than double the time anticipated for either of the Preferred or South 344th Street alternatives.

The extensive site preparation work required for the Midway Landfill Alternative subsurface construction design options would expose the surrounding community to construction impacts over a longer period. It would result in much higher volumes of construction traffic for exporting and importing large quantities of fill material. The Hybrid and Full Excavation subsurface construction design options are estimated to require up to approximately 570 peak daily truck trips over their site preparation phase (estimated to be up to 4 years, 4 months for the Full Excavation subsurface design option and 5 years, 7 months for the Hybrid subsurface design option). This is in comparison to approximately 80 or fewer peak daily truck trips for the other OMF South site alternatives, with also approximately 120 peak daily truck trips during mainline construction. It is important to note, however, that these estimates represent a conservative scenario during the site preparation phase and not a daily average of truck trips over the entire construction period. While I-5 and the arterials surrounding the Midway Landfill Alternative are anticipated to be able to accommodate the additional truck traffic, the substantial number of daily truck trips necessary for those subsurface construction design options could exacerbate existing congestion in some locations.

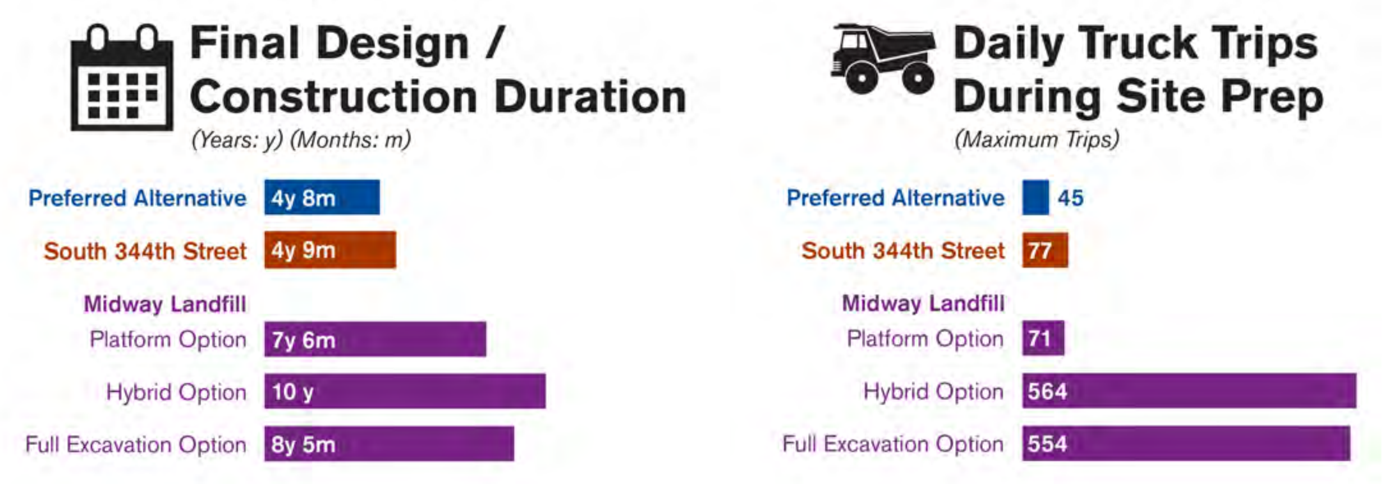
Should OMF South be at the Midway Landfill Alternative site, it would need to connect to the FWLE mainline tracks between the landfill and I-5. Construction of FWLE is underway and has a forecasted in-service date of 2026. FWLE would not preclude selection of the OMF South site at the Midway Landfill. If OMF South were to connect to the FWLE mainline tracks after they are operational, it could result in shutdowns of revenue service for periods of time during construction.

Figure ES-7: Illustrated Metrics – Comparative Cost Estimates



* Estimates are to be used for comparisons between alternatives only.
The Preferred Alternative and South 344th Street estimates are for the sites only.

Figure ES-8: Illustrated Metrics – Construction Duration and Traffic



OMF South Opening Schedule

Table ES-2 shows the forecasted in-service dates for the three OMF South build alternatives. Compared to the Preferred and South 344th Street alternatives, the Midway Landfill Alternative would open years later. The additional LRV maintenance and storage capacity provided by OMF South needs to be available with sufficient time to accept delivery of and commission new LRVs for expansion projects like TDLE and WSLE and to store existing LRVs. Without the OMF South in place, the Link light rail system would operate at reduced service levels.

Following the OMF South opening, the facility would begin receiving new LRVs. Completing delivery, testing, and commissioning for all new LRVs is anticipated to take about 3 years. Minimum operating segments and opening year service levels for TDLE and WSLE may not require all the new vehicles. Project schedules will be refined as project development advances and are not final until projects are in final design.

Table ES-2: OMF South Final Design/Construction Durations and Forecasted In-Service Dates

Characteristic	Preferred Alternative[1]	South 344th Street Alternative[1]	Midway Landfill Alternative
Final Design/ Construction Duration	4 years, 8 months	4 years, 9 months	Platform: 7 years, 6 months Hybrid: 10 years Full excavation: 8 years, 5 months
OMF South Forecasted In-Service Date	2032	2032	Platform: 2035 Hybrid: 2037 Full excavation: 2036

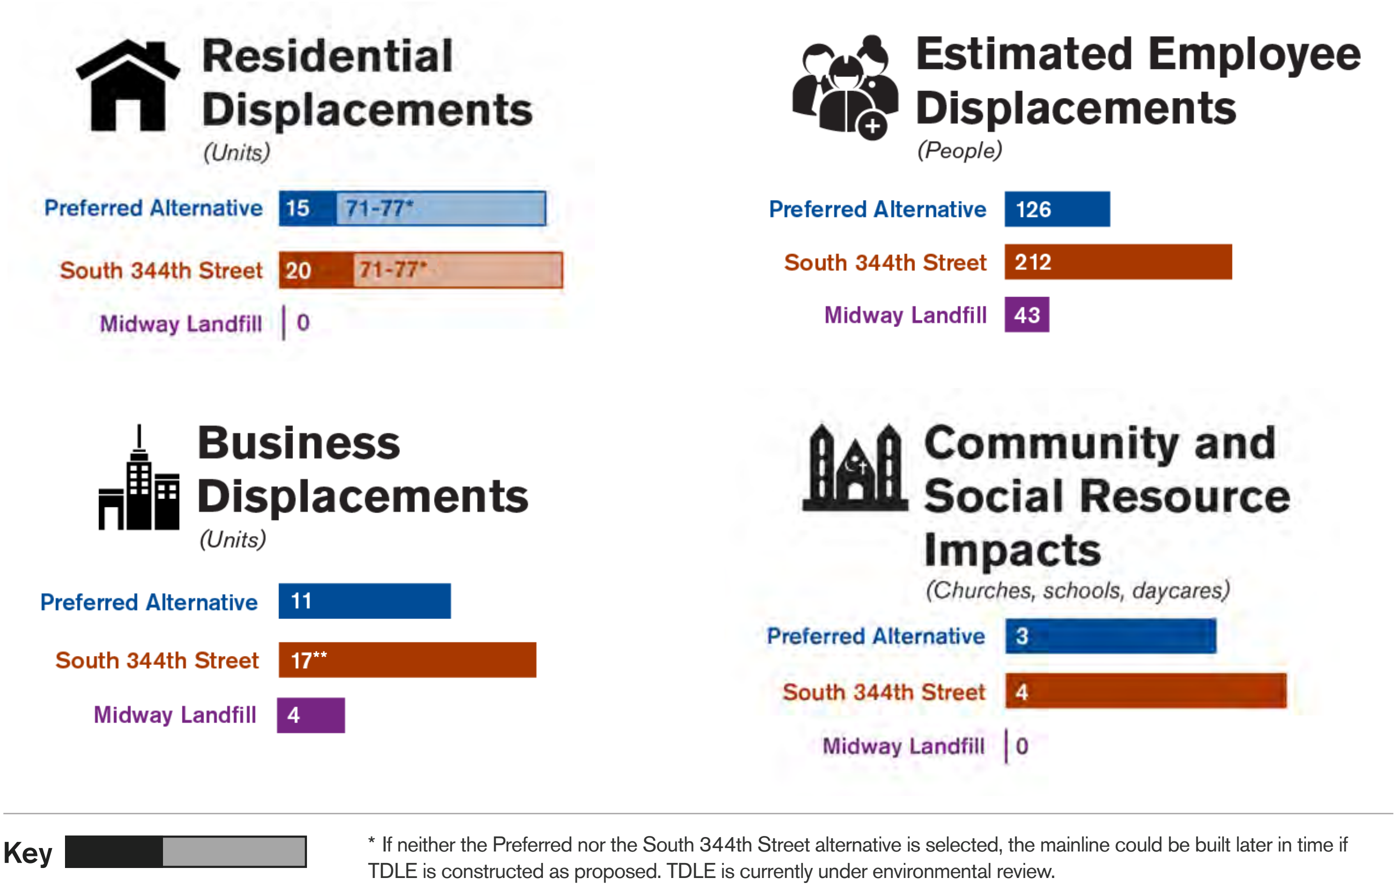
Notes: Final Design/Construction Duration includes 6 months construction float.

[1] Sound Transit is pursuing measures to advance the opening earlier (potentially 2030).

Acquisitions, Land Use, and Economics

The Preferred and South 344th Street alternatives would have the most displacements, particularly for residents and employees, as compared to the Midway Landfill Alternative, which is primarily undeveloped. Most of the residences displaced by the Preferred and South 344th Street alternatives are due to the mainline through the Belmor Mobile Home Park (Belmor). Relocating Belmor residences to mobile home parks may be challenging due to the limited availability within the area for relocating, purchasing, or renting mobile homes. The Midway Landfill Alternative would not displace any residences. However, if the Midway Landfill Alternative were selected to be built, the residential displacements from mainline construction could still occur if TDLE — currently subject to environmental review — is constructed as proposed.

Figure ES-9: Illustrated Metrics – Acquisitions, Land Use, and Economics



* If neither the Preferred nor the South 344th Street alternative is selected, the mainline could be built later in time if TDLE is constructed as proposed. TDLE is currently under environmental review.

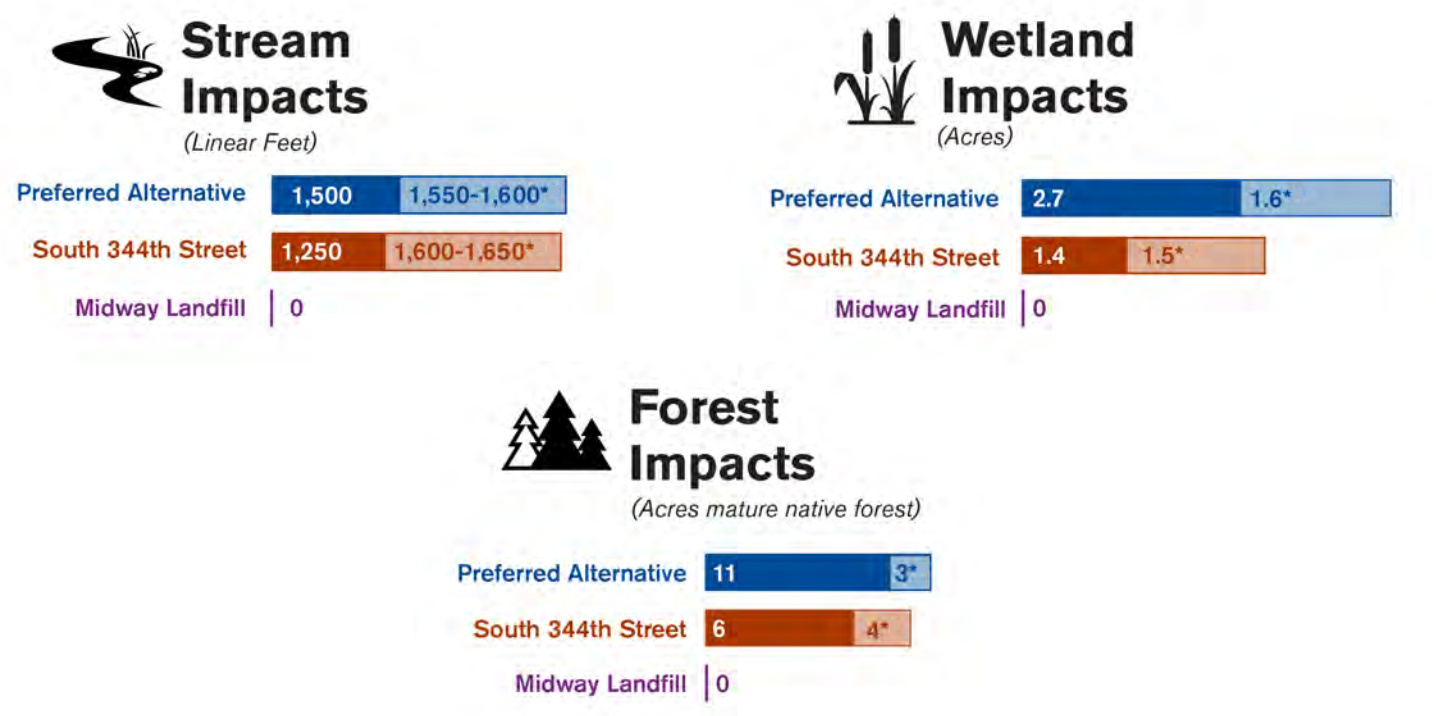
** Includes GarageTown, comprised of approximately 60 owners.

The Preferred Alternative would displace the Christian Faith Center, which includes a child-care center and the Pacific Christian Academy. The Christian Faith Center could be difficult to relocate because it consists of over 200,000 square feet of building space and numerous parking lots on an approximately 25-acre campus. The South 344th Street Alternative would displace the most businesses and employees, including the Ellenos Yogurt manufacturing facility and GarageTown, which includes approximately 60 owners. These properties could also be difficult to relocate due to their lot size, use, and specialized facility requirements. The South 344th Street Alternative would displace four religious facilities: Voice of Hope Church, Family Life Community Church, Redwood Church of God, and Tabernacle Temple of Praise.

Ecosystem Resources

Both the Preferred and South 344th Street alternatives are situated near tributaries of Hylebos Creek, including associated forested riparian habitat and wetlands that provide a range of ecological functions. The Preferred Alternative would have the greatest impact to ecological resources, including streams, wetlands, and mature native forest. The Midway Landfill Alternative is in an area with few natural resources and therefore would have minimal impacts to ecosystem resources.

Figure ES-10: Illustrated Metrics – Ecosystem Resources



Key ■ ▨

* If neither the Preferred nor the South 344th Street alternative is selected, the mainline could be built later in time if TDLE is constructed as proposed. TDLE is currently under environmental review.

The Preferred and South 344th Street alternatives would relocate portions of East Fork Hylebos Creek Tributary, which would lead to permanent impacts to adjacent wetland and forested riparian habitat. Some of the riparian habitat along the East Fork Hylebos Creek Tributary is also considered mature forested habitat. The mainline tracks for the Preferred and South 344th Street alternatives would impact the same area of wetland, but the South 344th Street Alternative mainline tracks would impact more wetland buffer areas due to the greater length of the tail tracks. However, if the Midway Landfill Alternative were selected to be built, impacts to East Fork Hylebos Creek Tributary could still occur if TDLE is constructed as proposed.

Salmonids are not currently known or expected to be present in reaches of East Fork Hylebos Tributary or West Fork Hylebos Tributary in the study area. However, these streams are designated as Essential Fish Habitat for Pacific salmon because of their potential to support fish use.

Hazardous Materials

The Midway Landfill Alternative poses unique risks that are not of concern for the Preferred and South 344th Street alternatives. As a Superfund site, the Midway Landfill is covered by a protective cap and is under active monitoring and reporting to ensure that the cleanup measures continue to function as planned. These protective and monitoring systems would need to be replaced or upgraded to varying degrees depending on the subsurface construction design option chosen. Further, the landfill waste is decomposing and settling at different rates, which creates engineering challenges as well as concerns for safety during construction and long-term operation and maintenance. The continuation of the landfill monitoring systems and mitigation for potential risks posed by settlement and methane gas over the lifespan of the facility would add to additional operating complexities and costs.

In addition to ground settlement and human health risks, the Midway Landfill Alternative would require Washington State Department of Ecology (Ecology) and/or EPA approval to amend the existing Ecology Cleanup Action Plan and EPA ROD to confirm that the project would maintain the environmental cleanup and protection commitments currently in place for the landfill. This approval process could be lengthy and poses risk to the project schedule and cost. Further, acquisition of and construction within the Midway Landfill would cause Sound Transit to incur potential liability under state law (the Model Toxics Control Act [MTCA]) and federal law (the Comprehensive Environmental Response, Compensation, and Liability Act [CERCLA]).

ES.4 Other Environmental Considerations

Environmental Justice

This Final EIS includes an Environmental Justice Assessment, as required by Executive Order 12898, Executive Order 14096, and Department of Transportation Order 5610.2C, in Appendix E. This analysis follows guidance in FTA Circular C-4703.1 and addresses whether the OMF South alternatives would result in disproportionate and adverse effects to minority or low-income populations and summarizes the public outreach to minority and low-income populations within the project area. The analysis also discusses the potential benefits of the project to minority and low-income populations, as well as the specific outreach efforts made during project development to involve these populations.

The population in the OMF South study area has a higher percentage of low-income and minority persons than the Sound Transit service district and King County. Project impacts primarily concern displacement of housing and community facilities — including religious facilities and childcare centers — and visual impacts. Other long-term and construction-related project impacts would be limited or avoided, minimized, or mitigated through the implementation of effective best management practices and mitigation measures.

Benefits to both environmental justice and non-environmental justice populations served by the project include enhanced community connectivity for the Preferred Alternative through public space and a multi-use trail integrated into the site design, construction jobs with project labor agreements and a disadvantaged business enterprise program to support hiring minority populations, and the creation of new high-skilled, living-wage jobs to operate the facility. Indirect benefits include supporting the Sound Transit 3 system expansion by providing capacity to ensure transit reliability, access, connectivity, and frequency. Although all populations would have access to these benefits to the same extent, the benefit would be greater for minority and low-income populations because these groups are more likely to use transit.

As part of its public engagement efforts during the OMF South scoping period and 2021 SEPA Draft EIS process, Sound Transit conducted a preliminary demographic analysis to identify low income, minority, and limited-English-proficiency populations. Based on this analysis, Sound Transit used specific strategies to reach those communities during public outreach. As the project moves forward, Sound Transit will continue to engage community leaders, jurisdictions, and social service providers to seek input, assess outreach methods, and identify additional ways to reach low-income, minority, and limited-English-proficiency populations.

After considering the project's potential effects, mitigation and avoidance measures and anticipated benefit to minority and low-income populations, FTA has determined that the OMF South project would not result in disproportionate and adverse effects on minority and low-income populations.

Section 4(f)/Section 6(f) Resources

Federal law protects historic properties and significant, publicly owned parks and recreation areas from being adversely affected by U.S. Department of Transportation projects. These resources are protected under federal laws commonly referred to as Section 4(f), Section 106, and Section 6(f). Cedar Grove Park and Town Square Park, both in Federal Way, are within the study area but would not incur impacts that would rise to the level of a Section 4(f) use. Five parks are within the Midway Landfill study area (Parkside Park, Parkside Wetlands, Salt Air Vista Park, Linda Heights Park, and West Hills Park). They also would not incur impacts that would rise to the level of a Section 4(f) use. The mainline for the Preferred and South 344th Street alternatives would require the relocation of Bonneville Power Administration (BPA) powerlines. FTA and BPA determined, and the State Historic Preservation Officer (SHPO) concurred, that raising the transmission lines to accommodate the OMF South project would have no adverse effect on historic properties under Section 106. Due to this, FTA has made a determination that the Preferred and South 344th Street alternatives would have a de minimis impact under Section 4(f). There would be no use of Section 4(f) properties for the Midway Landfill Alternative. There are no Section 6(f) resources in the OMF South study area and therefore no potential impacts.

ES.5 Cumulative Impacts

Cumulative effects are from past, present, and reasonably foreseeable future actions that could interact with the impacts of OMF South alternatives, regardless of the project proponent. As described above, there would be impacts associated with TDLE that would overlap with OMF South, particularly from the mainline tracks for the Preferred and South 344th Street alternatives. TDLE would introduce additional LRVs traveling at higher speeds, which would result in greater potential noise impacts. This could require additional mitigation in the form of longer noise barriers as well as mitigation for some vibration impacts, which could be constructed as part of the OMF South project. FWLE and TDLE, combined with OMF South, could have cumulative visual impacts due to additional elevated tracks, large structures, and clearing of trees and vegetation, particularly for the mainline alignments adjacent to I-5. Lastly, these projects, coupled with OMF South, would contribute cumulatively to reductions in the amount and function of ecosystem resources in the study area. In addition, the Federal Way City Center Access Project and Washington State Department of Transportation (WSDOT)

Triangle project are proposed adjacent to the Preferred and South 344th Street alternatives. The City Center Access Project is in the early design phase, but currently does not have guaranteed construction funding. The Triangle Project was suspended in 2023, with no date scheduled for resumption.

ES.6 Avoidance, Minimization, and Mitigation

Sound Transit would comply with applicable federal, state, and local environmental regulations and would apply mitigation measures to reduce significant adverse impacts. The Final EIS identifies measures to mitigate adverse impacts as well as avoidance and minimization measures that would be part of the project. The following summarizes select mitigation measures for impacts that the alternatives might not be able to minimize or avoid. These measures would be refined through final design and permitting.

Acquisitions, Displacements, and Relocations

Sound Transit would compensate and help relocate residents and businesses affected by property acquisitions, consistent with Sound Transit policy and applicable federal regulations.

Visual and Aesthetic Resources

Sound Transit would incorporate context-sensitive design measures that would be developed and refined during final design with input from the affected communities and cities. The design measures could include additional plantings and landscaping to minimize adverse visual impacts, along with retaining wall and building façade treatments. Landscaping and aesthetic treatments would be intended to add “human-scale” elements.

Sound Transit would consult with WSDOT staff to develop appropriate site-specific measures and mitigate impacts to Resource Conservation Areas adjacent to I-5 with replacement property or with other measures agreed to by WSDOT and FHWA, consistent with the WSDOT Roadside Policy Manual.

Noise

Noise barriers would be necessary to mitigate noise impacts from train operation along the 55 mph Design Option for the mainline tracks for the Preferred and South 344th Street alternatives. The noise barriers would be along the elevated mainline tracks along a portion of Belmor. The exact location would depend on the mainline design option chosen.

Both mainline options for the Preferred and South 344th Street alternatives would modify a portion of an existing berm and remove noise walls adjacent to I-5 that screen residences from traffic noise. While the retained fill structure to support the mainline would serve as a barrier to traffic noise from I-5, the modification of the existing berm and noise walls is anticipated to result in traffic noise impacts for about one to three residences. As a result, Sound Transit may need to replace portions of noise walls and berms along I-5 that would be removed as part of the Preferred and South 344th Street alternatives. If necessary, any replacement walls would be designed to maintain noise levels at or below the future noise levels predicted without the mainline. Sound Transit would conduct additional noise analysis during final design in coordination with WSDOT to confirm whether noise mitigation is needed.

Ecosystem Resources

Both the Preferred and South 344th Street alternatives would impact wetlands, streams, and their respective forested buffers. During final design and permitting,

Sound Transit would first work to avoid and minimize impacts through design measures and best management practices. For the Preferred Alternative, Sound Transit would continue to refine the site design during final design to minimize ecosystem impacts. This could include modifying the locations of buildings, track, and 18th Place South within the site boundaries. Where impacts are unavoidable, Sound Transit would mitigate them in accordance with applicable federal regulations, local critical area ordinances, and permit requirements.

After project construction, the temporarily impacted wetlands, streams and buffers would be restored and replanted onsite. Mitigation for permanent impacts could include use of an approved mitigation bank, such as the Port of Tacoma Upper Clear Creek Mitigation Bank, or in lieu fee programs, like the King County Mitigation Reserves Program. Impacts on wetlands and streams could also be mitigated through offsite mitigation actions developed in collaboration with Tribal, federal, and state agencies and the city of Federal Way.

ES.7 Significant Unavoidable Adverse Impacts

With the avoidance, minimization, and potential mitigation measures described in this Final EIS, significant adverse impacts could be avoided for most elements of the environment.

The Preferred and South 344th Street alternatives would have varying degrees of impacts to mature forest and other native vegetation, which would result in a loss of habitat. The loss of mature forested habitat, including adjacent to the I-5 corridor, would result in longer-term ecological and visual impacts that may not be immediately mitigable by replacement vegetation or restoration actions. Additionally, the introduction of the large-scale mainline with the Preferred and South 344th Street alternatives would have high visual impacts. Implementation of mitigation measures would soften views of the mainline but would not fully mitigate the visual impacts in some locations.

ES.8 Public Involvement to Date

Sound Transit has been engaging the public and agencies since the start of early scoping in 2018, conducted under SEPA. During that early scoping, Sound Transit held a 30-day comment period from April 2 to May 3, 2018, that included open houses and opportunities for the members of the public and agencies to provide input on the purpose and need of the OMF South and TDLE projects. In 2019, Sound Transit conducted formal public environmental scoping under SEPA. This included meetings with the public and agencies, public notices and advertisements, and a comment period from February 19 through April 1, 2019. During the development of the 2021 SEPA Draft EIS, Sound Transit continued community engagement activities through drop-in sessions and an online open house where attendees could learn more about the project. Additionally, Sound Transit has had continued coordination with agencies and local jurisdictions throughout the environmental review process.

The 2021 SEPA Draft EIS was available for an extended comment period of 45 days (March 5 to April 19, 2021) that included two online public meetings/hearings and other opportunities for the public and agencies to comment in writing. Appendix B, Public Involvement and Agency Coordination, has additional details including how Sound Transit has engaged low-income and minority populations.

As the design for the Preferred Alternative was advanced and modified in response to comments received during the 2021 SEPA Draft EIS comment period, FTA and Sound Transit determined the need for an EIS in compliance with NEPA to support federal funding and approvals. On July 19, 2023, FTA issued a notice of intent to prepare an EIS in the Federal Register and initiated a 30-day scoping period under NEPA. During the scoping period FTA invited comments on the project alternatives, information, and analyses relevant to the project.

The NEPA Draft/SEPA Supplemental Draft EIS was available for a 45-day comment period (September 22 to November 6, 2023) that included one in-person and one online public meeting/hearing and other opportunities to comment in writing, including through an online open house. Sound Transit continued community engagement and Tribal, agency, and local jurisdiction coordination activities throughout the comment period. See Appendix B, Public Involvement and Agency Coordination, for more details.

ES.9 Areas of Controversy and Issues to be Resolved

The following are known areas of controversy and issues to be resolved. Others may be identified as the project advances.

Preferred and South 344th Street Alternatives

The reconfiguration of surface streets under the Preferred Alternative and the removal of street segments within the South 344th Street Alternative site may not comply with Federal Way development regulations concerning the size of blocks within the street network. If the Board were to select either the Preferred Alternative or South 344th Street Alternative, Sound Transit would work with Federal Way through the street vacation process to address the standards.

Both the Preferred and South 344th Street alternatives would impact ecosystem resources, specifically wetlands and streams. This could pose a risk to both the schedule and budget of these alternatives, given the potential complexity and extent of negotiations related to the environmental permitting process and development of a comprehensive mitigation approach acceptable to Tribal, federal, state, and local agencies. During final design, Sound Transit would refine the site design to minimize impacts to ecosystem resources. Sound Transit would coordinate with Tribal, federal, state, and local agencies in defining the mitigation approach for unavoidable impacts.

Midway Landfill Alternative

Sound Transit has identified four risks that are unique to the site's prior use as a disposal facility and classification as a Superfund site: (1) ground settlement, (2) human health and safety, (3) legal, and (4) regulatory coordination. The first two risks are described in Appendix D, Midway Landfill Support Documents. Legal risk includes incurring potential liability under MTCA and CERCLA through purchase or lease of any portion of the landfill or through construction within the landfill. Regulatory risks include impacts to the project schedule due to the additional approvals needed before construction.

ES.10 Next Steps

The following steps are anticipated after the publication of the Final EIS:

- **Project Decision:** After the Final EIS is published, the Board will consider the public comments received and the alternatives evaluated in the Final EIS and select the project alternative to be built.
- **Federal Approval:** FTA will issue a ROD that states FTA's decision on the project, identifies the alternatives considered, and lists environmental mitigation commitments. The issuance of the ROD is required before federal funding or approvals.
- **Final Design and Construction:** This phase includes final facility design, permitting, property acquisitions and relocation, construction, and testing.
- **Open for Operations:** 2032 is the forecasted in-service date for the OMF South facility, based on Sound Transit's Resolution R2021-05.

Figure ES-11 below shows the anticipated schedule for the environmental review, design, construction, and opening of OMF South.

INTRODUCTION

In March 2021, the Central Puget Sound Regional Transit Authority (Sound Transit) published a Draft Environmental Impact Statement (EIS) under the State Environmental Policy Act (SEPA) for the Operations and Maintenance Facility South (OMF South) Project. After considering the 2021 SEPA Draft EIS and the comments received, the Sound Transit Board of Directors (Board) identified the South 336th Street Alternative as the Preferred Alternative for study in the Final EIS, along with the other alternatives (Motion M2021-81, December 2021). Subsequently, the design for the Preferred Alternative was advanced and modified in response to comments received during the 2021 SEPA Draft EIS comment period. To meet additional operational needs, a test track was added to the Preferred and South 344th Street alternatives. These changes are described in Section 2.2.8, Design Updates.

In January 2023, the Federal Transit Administration (FTA) and Sound Transit determined that compliance under the National Environmental Policy Act (NEPA) was necessary to support federal approvals and funding.

To reduce duplication of process, FTA and Sound Transit prepared a Draft EIS as a combined NEPA/SEPA document. Since a Draft EIS under SEPA was already published, the document served as a Draft EIS under NEPA and a Supplemental Draft EIS under SEPA, referred to simply as the Draft EIS herein. This document has been prepared under both NEPA and SEPA and is the Final EIS. FTA is the lead federal agency under NEPA, and Sound Transit is the lead agency under SEPA. The Final EIS evaluates a Preferred Alternative, two other build alternatives, and a No-Build Alternative. The No-Build Alternative represents the transportation system and environment as they would exist without the construction and operation of OMF South.

1 PURPOSE AND NEED FOR THE PROJECT

Sound Transit proposes to construct OMF South, an operations and maintenance facility (OMF) in the South Corridor to support Sound Transit's Link light rail system expansion. This expansion and the related increase in the light rail vehicle (LRV) fleet and daily operations is identified in Sound Transit 3: The Regional Transit System Plan for Central Puget Sound (Sound Transit 3). Sound Transit's goal is to preserve and promote a healthy and sustainable environment by minimizing adverse impacts to people and the natural and built environments.

1.1 Sound Transit 3: The Regional Transit System Plan for Central Puget Sound

Under Sound Transit 3, the light rail system in central Puget Sound would grow to 116 miles with over 80 stations. Figure 1.1-1 shows the full system planned for operation in 2042 under the target schedule. It includes light rail expansion north to Everett, south to Federal Way and Tacoma, east to Redmond, south Kirkland and Issaquah, and west to West Seattle and Ballard. In addition to the two existing operation and maintenance facilities — OMF Central, in Seattle, and OMF East, in Bellevue — new operation and maintenance facilities would be needed in the North and South Corridors to support the system expansion.

North Corridor

Sound Transit 3 includes extending light rail north from the Lynnwood Transit Center to downtown Everett via the Southwest Everett Industrial Center. The forecasted in-service date for this line is 2037 under the target schedule and includes six stations serving the areas of West Alderwood Mall, Ash Way, Mariner, Southwest Everett Industrial Center, State Route (SR) 526 near Evergreen Way, and the area at the existing Everett Station. Additional parking would be provided at the Mariner and Everett stations. A light rail OMF would be in the North Corridor to maintain and store a portion of the LRV fleet for the Everett to Alaska Junction and Mariner Way to Downtown Redmond services.

Affordable and Target Schedules

Due to steeply rising real estate prices and other construction expenses, Sound Transit projects currently in early planning and design, including OMF South, are seeing cost estimate increases. To ensure that funding remains available to complete all voter-approved projects, the Sound Transit Board conducted a "realignment" process that established the following two schedules:

Affordable Schedule: a schedule that is affordable, using current financial projections and cost estimates to set the general order in which projects will advance. This "affordable" schedule established an approach to prioritize, fund, and manage program work over time (Resolution 2021- 05).

Target Schedule: schedule for priority projects, as close to Sound Transit 3 Plan schedules as possible, reliant upon reductions in the affordability gap through cost savings and additional revenue.

Note: The 2042 operating plan is the target schedule.

Figure 1.1-1 Link Light Rail System Expansion

Central Corridor

Sound Transit 3 includes two light rail extensions within Seattle. The first extension would add 4.7 miles of light rail service from Seattle to West Seattle’s Alaska Junction neighborhood with four stations between South of Downtown (known as SODO) and Alaska Junction with service anticipated to begin in 2032. The second extension would add 7.1 miles of light rail service from downtown Seattle to Ballard, which includes a 3.3-mile light rail-only tunnel through downtown Seattle and South Lake Union and has a forecasted in-service date of 2039. This extension would have nine new stations between International District/Chinatown and Market Street in Ballard. In addition, three infill stations would be added serving NE 130th Street, S Graham Street, and S Boeing Access Road near Interstate 5 (I-5), with parking provided at the S Boeing Access Road station. Infill stations are new stations built on existing light rail lines. Connections to the existing OMF Central would be built to service vehicles operating in this corridor. OMF Central will maintain and store a portion of the LRV fleet for multiple lines.

East Corridor

Sound Transit 3 includes extending light rail on the Eastside, connecting Redmond, Bellevue, south Kirkland, and Issaquah to each other and to the rest of the regional system. Eastside investments include two stations serving southeast Redmond and downtown Redmond along with a new light rail line from south Kirkland to Issaquah via Bellevue, with a forecasted in-service date of 2041 under the target schedule. Four stations would be included in the latter light rail extension serving south Kirkland, the Richards Road area, Eastgate near Bellevue College, and central Issaquah. Additional parking would be provided at the southeast Redmond, south Kirkland, and central Issaquah stations. OMF East was constructed in 2021 in the East Corridor to maintain and store a portion of the LRV fleet for the Mariner Way to Downtown Redmond and South Kirkland to Issaquah services.

South Corridor

Sound Transit 3 includes funding to complete the light rail extension south from Kent/Des Moines to Federal Way, with stations at S 272nd Street (Star Lake Station) and the Federal Way Transit Center (which has since been renamed the Federal Way Downtown Station). This light rail extension is under construction, with a forecasted in-service date of 2026.

Sound Transit 3 plans to extend light rail from the Federal Way Downtown Station south to Tacoma. The forecasted in-service date is 2035. New stations would be in South Federal Way, Fife, and Tacoma, where the station would provide a multimodal connection to the existing Tacoma Link, Sounder commuter rail, Sound Transit Express Bus, and Amtrak. Parking would be added at the South Federal Way and Fife stations. OMF South (the proposed project) would be built in the South Corridor to maintain and store a portion of the LRV fleet for the Everett to West Seattle and Ballard to Tacoma Dome service as well as to receive, test, commission, store, maintain, and deploy new LRVs for the entire system.

Sound Transit 3 also includes an expansion of Tacoma Link to Tacoma Community College, with six stations. This is a separate fleet served by the Tacoma Link Operations and Maintenance Facility.

1.2 Purpose of the Project

The purpose of OMF South is to:

- Provide a facility with the capacity to receive, test, commission, store, maintain, and deploy vehicles to support the intended level of service for the system-wide light rail system expansion.
- Support efficient and reliable light rail service that minimizes system operating costs.
- Support and connect efficiently to the regional system and be technically and financially feasible to build, operate, and maintain, consistent with the Sound Transit 3 Plan and Sound Transit's Regional Transit Long-Range Plan.

1.3 Need for the Project

The project is needed because:

- The current regional system lacks a facility with sufficient capacity and suitable location to support the efficient and reliable long-term operations for system-wide light rail expansion, including the next phase of expansion in King and Pierce counties.
- New light rail maintenance and storage capacity needs to be available with sufficient time to accept delivery of and commission new vehicles to meet the expansion needs outlined in Sound Transit 3 and to store existing vehicles while the new vehicles are tested and prepared.

The OMF South project is necessary to support the addition of approximately 144 LRVs as part of the Sound Transit 3 system expansion. The facility includes functions that support the entire Link light rail system, such as receiving, testing, and commissioning new LRVs. In addition, OMF South would include Maintenance of Way (MOW) facilities and a Link System-Wide Storage building to receive and store vehicle parts and components, tracks and components, and station parts and components.

2 ALTERNATIVES CONSIDERED

2.1 Background and Project Development

Sound Transit was created to build a regional mass transit system connecting the urban centers of King, Pierce, and Snohomish counties. Figure 2.1-1 shows the regional light rail system with planned extensions and the locations of existing and planned OMFs. In 1996, the first phase of investment in the mass transit system began with Sound Move, which included regional express buses, commuter rail, and light rail (Sound Transit 1996). Sound Transit began operating the first phase of the Link light rail system, Central Link, with the line from downtown Seattle south to SeaTac in 2009.

OMF Central was built in Seattle as part of the first phase of Central Link construction. OMF Central is used to clean, store, maintain, and deploy 104 LRVs for daily service. It provides facilities for vehicle storage, inspections, heavy maintenance and repair, interior vehicle cleaning, and exterior vehicle washing. Additionally, new LRVs are currently received, tested (while stationary and at low speed), and commissioned at this facility. Higher speed testing of new LRVs is currently conducted on the mainline tracks in Tukwila during off-peak hours and at night when the light rail system is closed.

OMF Central also accommodates administrative and operational functions, such as serving as a report base for LRV operators, as well as the Link Control Center. Included is a MOW building for maintenance and storage of spare parts for tracks, vehicle propulsion equipment, train signals, stations and other infrastructure. Other facility elements include employee and visitor parking, operations staff offices, maintenance staff offices, dispatcher workstations, security offices, training rooms, and areas with lockers, showers, and restrooms for both operators and maintenance personnel.

The second phase of investment in the region’s mass transit system began with Sound Transit 2 in 2008 (Sound Transit 2008). Sound Transit 2 includes regional express bus and commuter rail services and 36 additional miles of light rail to form a 55-mile regional system. Sound Transit 2 extends light rail south to Kent/Des Moines and Federal Way (fully funded in Sound Transit 3), east to Redmond, and north to Lynnwood, and includes OMF East in Bellevue.

Sound Transit completed construction of OMF East in 2021 and began clearance testing for East Link in 2022. East Link will have a staggered opening; East Link Starter Line opened in spring 2024. When the East Link full line opens (forecasted in-service date of 2025), OMF East will be used to support up to 96 LRVs for daily service. It has facilities for vehicle storage, inspections, light maintenance and repair, interior vehicle cleaning, and exterior vehicle washing. It will also accommodate administrative and operational functions, such as serving as a report base for LRV operators. Included is a MOW building for maintenance and storage of spare parts for tracks, vehicle propulsion equipment, train signals, stations, and other infrastructure. Other facility elements include employee and visitor parking, operations staff offices, maintenance staff offices, dispatcher workstations, and areas with lockers, showers, and restrooms for both operators and maintenance personnel.

The third phase of investment began in 2016, with Sound Transit 3 (Sound Transit 2016a). In addition to bus, bus rapid transit, and commuter rail service expansion, Sound Transit 3 includes 62 new miles of light rail for a regional system reaching 116 miles. Sound Transit 3 extends light rail to Tacoma, Everett, south Kirkland, Issaquah, downtown Redmond, and the Seattle neighborhoods of West Seattle and Ballard.

Figure 2.1-1 Link System Future Expansion and OMF Site Locations

Sound Transit 3 calls for a total fleet (existing plus new) of approximately 460 LRVs. To meet Sound Transit 3's system expansion goals, Sound Transit needs two additional operations and maintenance facilities: one in both the North and South Corridors. The proposed OMF South project will satisfy the need for an OMF in the South Corridor and LRV testing to support system expansion.

2.1.1 OMF South Components

OMF sites are necessary throughout Sound Transit's light rail network to clean, store, maintain, and deploy LRVs (Figure 2.1-2).

OMF South is designed to accommodate three LRV types:

- Kinkisharyo: 62 LRVs are in the existing fleet. Each LRV is 95 feet long with 74 seats.
- Siemens S70: 152 LRVs are in the process of being delivered and tested. Each LRV is 95 feet long with 74 seats.
- New higher-capacity LRV: The new higher-capacity LRVs are anticipated to provide more seating and standing space and will carry about 5 to 10 percent more people (Sound Transit is in the process of selecting the new LRV model; no decision has been made at this time).

Sound Transit's light rail system runs on electricity supplied by a wire structure called the overhead catenary system; the dog-legged-shaped component that extends from the roof of the LRV to the overhead catenary system is called the pantograph. When contact is established, direct-current electricity from the wire is converted to alternating current for train propulsion.

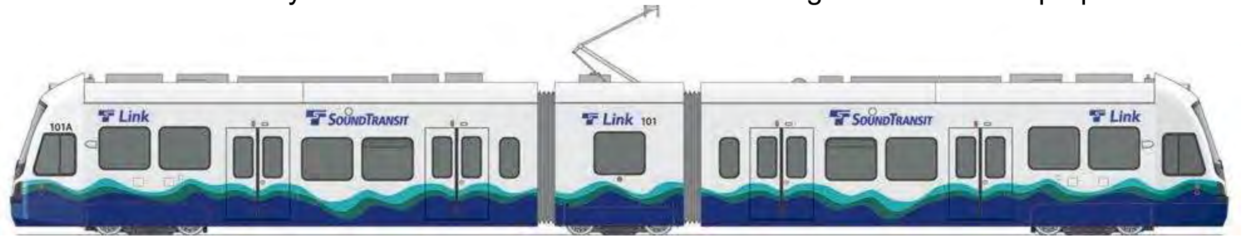

Figure 2.1-2 Link Light Rail Vehicle

The OMF South project includes the following components:

- Runaround tracks
- Storage tracks sized for approximately 144 LRVs
- Lead tracks connecting the site to the mainline tracks
- Maintenance building with service lanes for vehicle maintenance, repair, carwash, cleaning, painting, spare parts storage, operations, and administration
- Yard area for outside storage
- MOW building for maintenance and storage of spare parts for tracks, vehicle propulsion equipment, train signals, and other infrastructure
- Training track that includes all the track installation configurations found in the Link system
- Link System-Wide Storage building for receiving and storing all parts of the Link light rail system, including LRV parts and components, MOW track and components, and Facilities station parts and components

- Traction power substations (TPSS) to boost the power to the overhead catenary system that powers the LRVs
- Offices, locker rooms, lunchrooms, and other spaces for employees, including meeting rooms that could serve multiple purposes, such as classroom space
- Auto/truck access points
- Employee and visitor parking
- Sound Transit nonrevenue vehicle parking

Depending on the alternative selected, the OMF South project could also include a test track to prepare new vehicles for service.

The proposed dimensions and configuration of the OMF are primarily driven by the space required for the runaround track. This track allows LRVs to enter and move around within the site. Vehicles can either go directly to the storage area or continue to the maintenance and/or wash bays for service and then return to the storage area directly without the operator changing ends of the train. The OMF size is also driven by the size of the operations and maintenance building, the number of tracks needed to store the LRVs, and the desire to locate the MOW building and the Link System-Wide Storage building outside the OMF track loops to allow for more storage capacity and easier access.

An OMF connects to the light rail system mainline tracks via lead tracks. The lead tracks allow LRVs to deploy from the OMF to the mainline tracks for daily operation and travel back to the facility nightly for vehicle maintenance. The length of these lead tracks depends on the distance from the OMF to the operating mainline tracks and will vary by alternative. Because two of the alternatives would be the southern terminus of the existing Link system until construction of the proposed Tacoma Dome Link Extension (TDLE), the site configurations would also include tail tracks, which are simply an extension of the mainline past the OMF South site to allow trains to access the Link system from the south if the northern lead tracks are out of service. Figure 2.1-3 shows the different types of tracks found in a typical OMF.

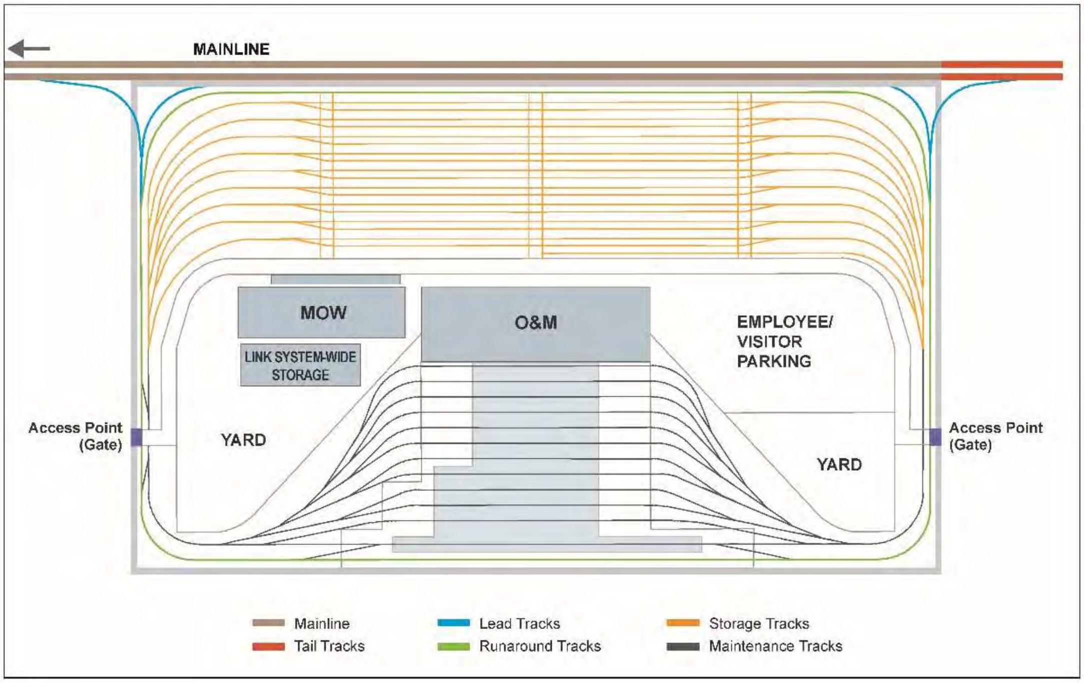

Figure 2.1-3 Typical OMF Schematic

2.1.2 OMF South Operations

The OMF South site operational program and functions do not vary between the build alternatives. The following describes how the proposed project would operate. There are three separate functions proposed for OMF South:

1. OMF building and yard for activities associated with the LRVs;
2. MOW and Facilities storage, workshop, and administration space; and
3. Link System-Wide Storage, an area dedicated to storage needs for the entire Link light rail system.

Some system-wide functions are planned at OMF South. Having these functions at OMF South would allow them to be in close proximity to the vehicle overhaul locations while also meeting existing system needs.

2.1.2.1 Hours

OMF South would operate 24 hours a day, 7 days a week. Approximately 610 staff would be distributed throughout the day at the site, but the largest concentration would be during the day shift, from 3:30 a.m. to 4 p.m. Employee arrival times would stagger throughout each shift. Table 2.2-1 lists staff calculations for all the functions at the site.

Trains receive cleaning and servicing between 1 a.m. and 5 a.m. Mainline tracks are also inspected during this time when no trains are on the tracks. This downtime is called the “nightly maintenance window.”

Table 2.2-1 OMF South Building/Yard, MOW, and Link System-Wide Storage Staff Calculations

	Day	Swing	Graveyard	Total
	3:30 a.m. – 4 p.m.	11 a.m. – 11:30 p.m.	6:30 p.m. – 7:30 a.m.	
Staff Totals	250	195	165	610

2.1.2.2 Light Rail Vehicle Operations and Maintenance

OMF South would be used to receive, test, commission, store, maintain, and deploy approximately 144 vehicles for daily service. The final number of LRVs maintained at this location will be determined in the Rail Fleet Management Plan update, currently underway by South Transit. OMF South would provide facilities for vehicle storage, inspections, maintenance and repair, interior vehicle cleaning, and exterior vehicle washing. Additionally, the facility would receive, test, and commission new LRVs for the entire light rail system.

Because new LRVs require testing at a variety of operating conditions, including running at top speed and testing acceleration and braking functions, depending on the alternative, OMF South would include a dedicated test track. During testing, up to eight one-car LRVs could make one roundtrip per hour for 4 hours during the daytime and 6 hours during the nighttime. Sound Transit currently uses the mainline revenue track to test vehicles at higher speeds at night, after service has ended (after midnight or 1 a.m.) and outside of maintenance and inspection times.

2.1.2.3 Maintenance of Way

MOW is defined as the upkeep and repair of a railroad's fixed property (such as track and bridges). While the OMF focuses on the LRVs, the MOW's focus is on the track and its corresponding electrical system, including signals and traction power (the electricity that powers the trains).

The MOW area within OMF South would include a large warehouse for equipment and supply storage, shop space, offices, and staff support areas. To train staff on track maintenance, the area would also include a training track, which would be at least 400 feet long and include all the possible track types and configurations found on Sound Transit's rail lines.

Various crews and superintendents (including Track, Right-of-Way, Signal, and Traction Power) would be stationed at OMF South.

2.1.2.4 Link System-Wide Storage

The Link System-Wide Storage building would include areas for storing, shipping, receiving, and supplying all parts for the Link light rail system, including LRV parts and components, MOW track and components, and Facilities station parts and components. There would be a dedicated staging and packaging area for items to be placed before storing or sending out to a Link light rail facility. There would also be office and administrative space.

2.1.2.5 Light Rail Vehicle Fleet Headways and Service Times

Table 2.2-2 includes information on headways by time of day taken from the draft Link light rail system operating plan for 2042. Headway is the amount of time between LRV arrivals at a stop. The draft operating plan assumes 5- to 6-minute peak headways for weekdays and 10- to 15-minute headways on Saturday and Sunday, once the planned light rail extensions under Sound Transit 3 are complete. This draft plan is subject to change.

Table 2.2-2 Draft Operating Plan for Link Light Rail

Service Period	Hours	Headway
Weekday Service		
Early Morning	5:00 a.m. to 6:00 a.m.	12 minutes
Morning Peak	6:00 a.m. to 8:30 a.m.	5–6 minutes
Midday	8:30 a.m. to 3:00 p.m.	10 minutes
Afternoon Peak	3:00 p.m. to 6:30 p.m.	5–6 minutes
Evening	6:30 p.m. to 10:00 p.m.	10 minutes
Late Night	10:00 p.m. to 1:00 a.m.	15 minutes
Saturday		
Early	5:00 a.m. to 8:00 a.m.	12 minutes
Base	8:00 a.m. to 10:00 p.m.	10 minutes
Late	10:00 p.m. to 1:00 a.m.	15 minutes
Sunday		
Early	6:00 a.m. to 8:00 a.m.	12 minutes
Base	8:00 a.m. to 10:00 p.m.	10 minutes
Late	10:00 p.m. to 12:00 a.m. (midnight)	15 minutes

2.2 Alternative Development and Scoping

OMF South alternatives underwent an extensive evaluation process prior to their identification for study in the 2021 SEPA Draft EIS. Beginning in early 2018, Sound Transit conducted early scoping followed by alternative development, including site identification, prescreening, and alternatives evaluation. In early 2019 several alternatives were presented to the public during SEPA scoping, and in May 2019 the Board identified three project alternatives for evaluation in the 2021 SEPA Draft EIS. The SEPA Draft EIS was published in March 2021, and Tribal, public, and agency comments were received. Based on the 2021 SEPA Draft EIS and comments received, the Board identified the South 336th Street Alternative as the Preferred Alternative for evaluation in this Final EIS, along with other alternatives, in December 2021 (Motion M2021-81). Please see Section 2.2.7 for additional detail on the environmental review process.

2.2.1 Early Scoping

In March 2018, Sound Transit published the Tacoma Dome Link Extension and Operations and Maintenance Facility South Early Scoping Information Report (Sound Transit 2018a). Early SEPA scoping was intended to initiate the public conversation before the start of environmental studies and was conducted for both the TDLE and OMF South projects concurrently. The public comment period for early scoping was from April 2 to May 3, 2018, during which Sound Transit asked for Tribal, public, and agency comments on the project’s Purpose and Need statement, the TDLE “representative project alignment” and other alternative alignments, and alternative locations for an OMF in the South Corridor. Sound Transit received approximately 50 comments regarding the potential OMF South location, including suggestions for sites in Kent, Federal Way, Milton, Fife, and Tacoma.

Additional information regarding public outreach during the early scoping period is available in Appendix B, Public Involvement and Agency Coordination.

2.2.1.1 OMF South and Tacoma Dome Link Extension Relationship

TDLE has overlapping project elements with the OMF South Preferred and South 344th Street alternatives, which consists of about 1.4 to 1.8 miles of mainline track. However, the projects are independent of each other.

As described in Chapter 1, Purpose and Need for the Project, OMF South is needed to support Sound Transit’s Link light rail system expansion identified in Sound Transit 3. OMFs do not exclusively serve individual light rail alignments. They are necessary and work together to operate the entire Link System. If TDLE were not constructed, OMF South would still be necessary to support other extensions of Link light rail planned under Sound Transit 3. It would provide additional operation and maintenance capacity, allowing Sound Transit to shift trains within the system to minimize overall operating costs. It would also provide greater efficiency and flexibility in overnight storage and maintenance of light rail vehicles and deployment of vehicles at the start of service each day.

TDLE is a major Link light rail service extension and could be built without OMF South. Without OMF South, TDLE could be designed to include facilities for overnight storage and limited maintenance functions. Further, Sound Transit could adjust service levels to adapt to a smaller fleet. FTA and Sound Transit are preparing a separate environmental impact statement to assess TDLE impacts.

2.2.2 Identifying Potential OMF South Sites

2.2.2.1 Site Identification

After early SEPA scoping, Sound Transit initiated the alternative development process, evaluating a total of 24 sites (Figure 2.2-1). These sites were identified through a series of internal workshops with Sound Transit staff and the consultant team and by the public during early SEPA scoping.

Figure 2.2-1 OMF South Sites Included in the Development of SEPA Alternatives

Sound Transit determined that OMF South should be designed to support the future extensions of the light rail system, including the extension to Tacoma, as envisioned in the agency's Regional Transit Long-Range Plan (Sound Transit 2014) and should be sized to accommodate approximately 144 LRVs.

2.2.2.2 Prescreening

The prescreening evaluation used three criteria to evaluate the 24 sites identified during early SEPA scoping. Sound Transit developed the evaluation criteria based on the OMF South Purpose and Need statement.

- **Meets minimum size and shape.** This criterion evaluated each site's ability to store and maintain at least 144 LRVs and accommodate a 5-acre storage site.
- **Roadway improvements.** This criterion considered whether selection of the site would preclude funded roadway improvements.
- **Regulatory constraints.** This criterion evaluated the potential for severe impacts to known cultural resources, wetlands, and other sensitive areas.

The evaluation criteria were applied to each site using a pass or fail method. If a site failed one criterion, it was not advanced to the next stage in the alternative development process. As a result, six sites were eliminated and two configuration options were added for each Midway Landfill site, for a total of 20 potential sites. The complete results of the pre-screening evaluation are summarized in the OMF South Pre-Screening Technical Memorandum (Sound Transit 2018c).

2.2.2.3 Alternatives Evaluation

The alternatives evaluation used a total of 21 criteria (Table 2.2-3), including environmental factors, operational and cost factors, and plan consistency, to evaluate the 20 sites that moved forward from prescreening to SEPA alternatives evaluation (Figure 2.2-1).

Table 2.2-3 Evaluation Criteria, Measures, and Methods

Criteria	Measures	Methods
Environmental Factors		
Current and Proposed Zoning	Suitability of current and proposed zoning/land use for use as an OMF.	Identify current and proposed zoning on the site using existing city and county land use and zoning maps, and proposed development plans adjacent to adopted land use plans.
Economic	Site located on properties with major economic activity generators.	Assessment of potential property impacts that have a major economic activity generator.
Property Impacts	Estimated level of property impacts (residential, commercial).	Assessment of potential property impacts from OMF South by property type.
Streets/Roads	Auto and truck access to the site from existing highway/arterial system.	Prepare site layouts that show the auto and truck access route to the OMF South site.
Neighborhood/ Community	Impacts to major neighborhood/community cohesion and whether impacts will be equitably distributed.	Identify potential impacts to neighborhood/community cohesion.
Topography	Amount of grading required to accommodate facility.	Prepare site layouts that assess the relative amount of grading required for the OMF South site.

Table 2.2-3 Evaluation Criteria, Measures, and Methods (continued)

Criteria	Measures	Methods
Wetlands and Streams	Disruption to wetland and stream resources or priority habitat areas on or adjacent to the site.	Identify the disruptions to sensitive areas, including wetlands and streams, buffers, steep slopes, or sensitive species or habitat, using geographic information system (GIS) mapping and visual reconnaissance.
Floodplains and Critical Areas	Impacts to floodplains or other critical areas.	Identify floodplains and other critical areas using GIS mapping.
Parks, Trails, and Open Space	Impacts to parks, trails, or open space.	Identify potential impacts to parks, trails, or open space on or adjacent to the OMF South site using GIS mapping.
Historic/Archaeological	Impacts to historic, archaeological resources on or adjacent to the site.	Identify the impacts to National Register of Historic Places eligible historic and archaeological resources on or adjacent to the OMF South site using records search and general reconnaissance.
Hazardous Materials/ Brownfields	Potential to impact sites with hazardous materials.	Identify potential for impacts to sites with hazardous materials releases.
Noise	Potential for impacts to noise-sensitive properties.	Number of noise-sensitive property types within Federal Transit Administration (FTA) noise impact screening distance of 350 feet for unobstructed noise generating areas of the site or connecting tracks.
Operational and Cost Factors		
Size/Configuration	A minimum site size of 33 acres able to store and maintain approximately 144 vehicles, plus an additional 5-acre storage area that includes a 30,000-square-foot building on or adjacent to the site.	Prepare conceptual site layouts that include building footprints, storage tracks, auto/truck access, employee and support vehicle parking, and a 5-acre storage area that includes a 30,000 square foot building on or adjacent to the site.
Maintenance Window	Impact on the nightly maintenance window of 1 a.m. to 5 a.m.	Estimate the impact in minutes on the maintenance window for the OMF South site based on information generated from the Operations Analysis.
LRV Site Access	LRV access to the site related to the complexity of the connection and the distance from the FWLE or TDLE representative alignment.	Identify the complexity and length of the yard lead and track connection to the OMF South sites.
Schedule Risk (Other than LRV Access)	Will the facility be able to receive and commission LRVs per ST3 Operations Analysis?	Identify potential site constraints such as property availability, access, or other logistical, physical, or regulatory factors that would affect the schedule for the facility to be ready to receive and commission LRVs per the ST3 Operations Analysis.
Operability	When the facility (OMF South) opens, will the site be connected to an activated line to allow vehicles to move around the system?	Identify the length of track required to connect the site to an activated line.
Operating Estimates	Order of magnitude operating estimates.	Assess the relative order of magnitude operating estimate for each site.
Capital Estimates	Order of magnitude preliminary capital estimates for the site footprint, 5-acre storage site, and lead track.	Develop order of magnitude preliminary capital estimates for each site, 5-acre storage site, and lead track to the representative alignment.
Property Value	Assessed value plus escalation factors for each property affected by the project footprint of the facility.	Current county property values plus escalation factors for parcels that need to be acquired in order to construct the facility.

Table 2.2-3 Evaluation Criteria, Measures, and Methods (continued)

Criteria	Measures	Methods
Plan Consistency		
Sound Transit Regional Transit Long-Range/ST3 Plan	Consistent with the Sound Transit Regional Transit Long-Range Plan and ST3 Plan.	Compare site with Sound Transit Regional Transit Long-Range Plan and ST3 Plan for consistency and evaluate whether the site is technically and financially feasible to build, operate, and maintain.

Source: Sound Transit 2018c

As a result of the alternatives evaluation, Sound Transit identified six sites to carry forward to the SEPA scoping process. The nine southernmost sites, including all of those in Pierce County, were eliminated because they were not close enough to an operating light rail mainline track. Sound Transit also found that potential sites farther than 1.5 miles south of the Federal Way Link Extension (FWLE) terminus in Federal Way would not be able to efficiently connect to an operating light rail mainline track when the OMF South opens. Another five sites were eliminated because they performed poorly in other criteria. The complete results of the alternatives evaluation are summarized in the OMF South Alternatives Evaluation Technical Memorandum (Sound Transit 2019c).

2.2.3 SEPA Scoping

Sound Transit published the scoping notice for the EIS in the SEPA Register on February 19, 2019. The SEPA Register is a statewide searchable database where anyone can search and download NEPA and SEPA documents submitted to Ecology to allow easy access to the public, project proponents, local governments, and other agencies. The purpose of scoping is to narrow the focus of the SEPA EIS to significant environmental issues, to eliminate insignificant impacts from detailed study, and to identify a reasonable range of alternatives (Ecology 2003). Sound Transit also asked for comments regarding the project's Purpose and Need statement.

Sound Transit also published the OMF South Scoping Information Report (Sound Transit 2019d) to share information about the project and potential alternatives with Tribes, agencies, and the public. The Information Report described the six sites considered during the SEPA scoping process (Figure 2.2-2):

- S 240th Street and SR 99
- Midway Landfill and I-5
- Midway Landfill and SR 99
- S 316th Street and Military Road
- S 336th Street and I-5
- S 344th Street and I-5

During the public comment period (February 19 to April 1, 2019), Sound Transit accepted comments from Tribes, agencies, and the public and conducted two public scoping meetings, an agency scoping meeting, and an online open house (see Appendix B, Public Involvement and Agency Coordination). The OMF South Scoping Summary Report summarizes the comments received during the SEPA scoping process and identified the next steps for the project (Sound Transit 2019e).

Figure 2.2-2 SEPA Scoping Alternatives

Most public comments concerned the S 240th Street and SR 99 site, which became known as the Dick's Drive-In alternative (this alternative would have displaced the business). Many of those commenters preferred one, both, or either of the Midway Landfill sites and asked Sound Transit to remove the S 240th Street and SR 99 site from further consideration.

2.2.3.1 Alternatives Proposed During Scoping but Not Carried Forward

During the SEPA scoping process, some commenters suggested specific additional sites be considered. A total of nine sites were mentioned:

- SeaTac – North of the Angle Lake Station, west of 28th Avenue S between S 200th Street/ S 190th Street
- Kent/Des Moines area – Area along I-5 in Des Moines that is the current location of the Silverwood Park Apartments
- Kent Highlands Landfill
- Kent – Vacant parcel on SR 99 across from Fred Meyer in Kent
- Kent/Federal Way – Area between I-5/SR 99 and S 260th Street/S 272nd Street
- Kent Valley near S 272nd Street
- Auburn Yard adjacent to the Sounder tracks
- The Commons at Federal Way on S 320th Street
- South Federal Way – Wetland between Todd Beamer High School and SR 99 in Federal Way

Sound Transit conducted an internal review of the suggested sites using the criteria listed in Table 2.3-1 to determine whether any were viable alternatives. Sound Transit determined that none were viable due to a number of reasons, including size, potential impacts to current light rail operations, and potentially severe impacts to sensitive areas.

2.2.4 Board Identification of Site Alternatives

In May 2019, the Board adopted Motion M2019-50, which identified three site alternatives to study in the OMF South 2021 SEPA Draft EIS: Midway Landfill and I-5, S 336th Street and I-5, and S 344th Street and I-5. These alternatives were renamed Midway Landfill Alternative, South 336th Street Alternative, and South 344th Street Alternative, respectively, and are described in more detail below in Section 2.3, Project Alternatives. The remaining three sites — S 240th Street and SR 99, Midway Landfill and SR 99, and S 316th Street and Military Road — were not carried forward. The Board's action was based on the project's Purpose and Need statement, OMF site requirements and screening criteria during the alternative development process, and comments received during the scoping period. In July 2019, the Board adopted Motion M2019-75 for TDLE, identifying a preferred alternative that narrowed the location of the mainline tracks to an alignment that parallels I-5 in the area south of the Federal Way Downtown Station to the South 336th Street and South 344th Street alternative sites.

2.2.5 Refinement of Alternatives for the 2021 SEPA Draft EIS

At the beginning of the site identification process, Sound Transit developed a generic 1,550-foot by 930-foot OMF layout template that it used to test-fit potential sites. After including setbacks, landscaping, environmentally critical areas, roadways, lead track connections to the mainline tracks, and the 5-acre Link System-Wide Storage facility, it appeared that a site of 40 to

50 acres would be large enough to meet the needs of OMF South. However, as project development continued, and the programming requirements of OMF South were more fully refined to develop the 2021 SEPA Draft EIS alternatives, it became apparent that larger sites were necessary. For example, additional spaces for LRV repair and cleaning were added to the initial design based on lessons learned at OMF Central and from the design of OMF East. Sound Transit also sought to minimize impacts to surrounding neighborhoods by maximizing setbacks to create buffers between the sites and adjacent properties.

During August and September 2019, Sound Transit confirmed that these additional requirements should be incorporated. The increased program requirements meant larger sites; the three sites studied in the 2021 SEPA Draft EIS ranged from 59 to 68 acres.

2.2.6 2021 SEPA Draft EIS Publication and Board Identification of Preferred Alternative

The SEPA Draft EIS was published in March 2021 with a public comment period extending from March 5 to April 19, 2021. After considering the 2021 SEPA Draft EIS and the comments received, the Board identified the South 336th Street Alternative as the Preferred Alternative for evaluation in the Final EIS (Motion M2021-81, December 2021). The Preferred Alternative is evaluated along with the two other alternatives in this Final EIS.

2.2.7 Federal Environmental Review Process

After publication of the 2021 SEPA Draft EIS, Sound Transit identified potential funding opportunities with FTA. Subsequently, FTA issued a notice of intent to prepare an EIS in the Federal Register on July 19, 2023. This was followed by a 30-day comment period.

To reduce duplication of process, FTA and Sound Transit prepared a Draft EIS as a combined NEPA/SEPA document. Since a Draft EIS under SEPA was already published, the document served as a Draft EIS under NEPA and a Supplemental Draft EIS under SEPA. This document has been prepared under both SEPA and NEPA and is the Final EIS.

2.2.8 Design Updates

After publication of the 2021 SEPA Draft EIS and the December 2021 Board action, Sound Transit advanced the design for OMF South. Design updates were primarily driven by operational needs, comments received during the 2021 SEPA Draft EIS comment period, and coordination with the city of Federal Way.

One design update that Sound Transit identified is the need for a test track to allow LRVs to be tested without using the mainline tracks. Sound Transit currently relies on accessing the mainline revenue track at night to test vehicles at higher speeds after service has ended and outside of maintenance and inspection times. As the existing track, structures, and systems infrastructure grows and ages, the need for night-time maintenance will likely increase, reducing the available windows for vehicle testing and commissioning. A dedicated test track would allow Sound Transit to test trains both during the day and overnight, reducing the amount of time it takes to test vehicles and improving employee safety by keeping testing off the mainline.

For the Preferred and South 344th Street alternatives, the test track would run east of and parallel to the mainline tracks from S 324th Street to just south of S 336th Street. This widens the permanent footprint of the mainline tracks from the 2021 SEPA Draft EIS by approximately 15 feet where the tracks are parallel and slightly wider at the ends of the test track. There would also be an access road that would parallel the mainline track and test track alignment through

Belmor Mobile Home Park (Belmor), along with a test track facility separate from the OMF South site. This 1,000-square-foot building would include a breakroom and facilities for employees working at the test track.

In addition to the test track, Sound Transit revised the site configuration for the Preferred Alternative to address Federal Way street vacation requirements (a street vacation relinquishes the public's right to use a street and returns it to private property) and local design standards as well as to address other developmental and operational needs. The design updates for the Preferred Alternative included the following:

- The main site entrance was moved from SR 99 to S 341st Place, which slightly changes the expected traffic circulation patterns.
- 18th Place S was extended approximately 1,450 feet to connect S 340th Street and S 336th Street as a replacement for the removal of 20th Avenue S. The extended street would include a bike/pedestrian trail to provide public amenities.
- 21st Avenue S was extended approximately 650 feet to connect to S 344th Street to avoid creating a nonconforming cul-de-sac.
- Frontage improvements (including road widening) were added on the south side of S 336th Street to meet city requirements.
- The OMF South site was expanded to the southwest to provide more space for buildings and yard area.
- The OMF South site and internal track configuration were modified to a parallelogram shape to allow for a wider stream and wetland corridor on the east side of the OMF between the site and I-5.
- Existing culverts that carry the West Fork Hylebos Creek Tributary under S 336th Street and the East Fork Hylebos Creek Tributary under S 344th Street would be replaced.

Design of the Preferred Alternative is likely to continue to evolve as Sound Transit works to minimize and mitigate environmental impacts. No revisions have been made to the site designs for the South 344th Street or Midway Landfill alternatives since the 2021 SEPA Draft EIS.

2.3 Project Alternatives

2.3.1 No-Build Alternative

The No-Build Alternative represents the transportation system and environment as they would exist without the proposed project and provides a benchmark against which the build alternatives can be compared.

The No-Build Alternative assumes other planned projects would be built. This includes public and private projects as well as the other Link light rail system improvements listed in Sound Transit 3, such as extensions to West Seattle, Ballard, Everett, downtown Redmond, Issaquah, and Tacoma. The No-Build Alternative also assumes that the proposed North Corridor OMF would be constructed. Under the target schedule for Sound Transit's System Expansion Plan, each of these projects would be constructed and operating by 2042.

The Sound Transit 3 Plan assumed 460 LRVs would be needed to operate the system at the planned service levels. After the opening of University Link, this number increased to 496 LRVs to account for higher than anticipated ridership and additional capacity for a future extension of the light rail spine to Tacoma Mall. Under the No-Build Alternative, operations and maintenance functions for the entire system would be at the existing OMF Central, the existing OMF East in

Bellevue, and the proposed OMF in the North Corridor. The three facilities would have a combined capacity to support and store 352 LRVs, which is 144 fewer than the number needed to operate the system at the planned service levels.

Under the No-Build Alternative, impacts from the Sound Transit 3 projects listed above would still occur. As the FWLE and TDLE projects are within the study areas for the OMF South project alternatives, there are impacts that may be similar or that overlap with those of OMF South. FWLE is under construction with a forecasted in-service date of 2026. The impacts of FWLE have been addressed in the Federal Way Link Extension Final Environmental Impact Statement (Sound Transit 2016b). TDLE is currently undergoing environmental review under NEPA and SEPA by FTA and Sound Transit. The Tacoma Dome Link Extension Draft Environmental Impact Statement is expected to be published in mid-2024, with a forecasted in-service date of 2035.

As described in Section 2.2.4, Board Identification of Site Alternatives, the Board identified a preferred alternative that narrowed the location of the TDLE mainline tracks to an alignment that parallels I-5 south of the Federal Way Downtown Station. As a result, the mainline track alignment for the OMF South Preferred and South 344th Street alternatives south of the Federal Way Downtown Station are the same as the mainline track alignment proposed for TDLE. Thus, impacts from the mainline tracks would be primarily the same between the two projects.

For the purposes of this Final EIS, the analysis of the No-Build Alternative is generally based on the expected conditions in 2042, which is the future design year for the project. The year 2042 represents the first year after completion for many of the Sound Transit 3 projects. Due to the realigned capital program (Resolution R2021-05, August 2021) completion of some Sound Transit 3 projects may be delayed past 2042; however, 2042 provides a common future analysis year for forecasting ridership and determining potential impacts to air, noise, transportation, and other environmental elements from Sound Transit 3 projects.

The environmental impacts associated with FWLE and TDLE are considered part of the No-Build Alternative, along with other planned projects in the OMF South study areas. The Final EIS assumes that one of the TDLE build alternatives would be constructed with mainline tracks in the same location as described for the Preferred and South 344th Street alternatives. Under the No-Build Alternative, the mainline track could be constructed later in time.

2.3.2 Build Alternatives

Build alternatives evaluated in this Final EIS include the South 336th Street Alternative (the Preferred Alternative), the South 344th Street Alternative, and the Midway Landfill Alternative (Figure 2.3-1). Appendix C, Conceptual Design Drawings and Engineering Information, includes preliminary engineering design drawings of each of the alternatives. Since publication of the 2021 SEPA Draft EIS, the design of the Preferred Alternative has been advanced to between the 10 and 30 percent design level.

The Preferred Alternative would require the construction of approximately 1.4 miles of mainline tracks, and the South 344th Street Alternative would require approximately 1.8 miles of mainline tracks to connect the FWLE terminus to the OMF South facility (Figure 2.3-2). The Midway Landfill Alternative is adjacent to FWLE and would connect by lead tracks directly to the FWLE mainline tracks. For the Preferred and South 344th Street alternatives, the mainline tracks connecting those sites to the FWLE terminus would later also be used as TDLE mainline tracks if a proposed TDLE build alternative opens for service. The connecting section of mainline tracks would be constructed for the OMF South project as this facility would open several years before TDLE begins to serve the regional system.

FIGURE 2.3-2

Mainline Track Options

Preferred and South 344th Street Alternatives

OMF South

The Preferred and South 344th Street alternatives would also include a test track adjacent to the mainline tracks. A test track adjacent to the Midway Landfill alternative would not be feasible because of the varying grades of the existing mainline tracks. Thus, under the Midway Landfill alternative, the analysis assumes LRV testing would continue on the mainline tracks.

2.3.2.1 South 336th Street Alternative (Preferred Alternative)

The Preferred Alternative is in Federal Way mainly between S 336th Street and S 341st Place and between I-5 and SR 99.

Mainline Tracks

The Preferred Alternative requires approximately 1.4 miles of connecting mainline tracks from the Federal Way Downtown Station to the site, including a tail track. These tracks would serve as revenue mainline tracks if TDLE is constructed as proposed.

There are two alignments for the connecting mainline tracks that have different design speeds for the curve near S 324th Street: the 40 mph Alignment and the 55 mph Design Option (Figure 2.3-2). The Preferred Alternative includes the 40 mph Alignment (Figure 2.3-3). Both the Preferred Alternative and Design Option have elevated tracks from the Federal Way Downtown Station to near S 328th Street and south of S 330th Street to the OMF South facility. The tracks would be at-grade between S 328th Street and S 330th Street. Also included as part of the mainline track structure would be TPSS, signal/communication bungalows, and end-of-track protection.

Tail tracks would extend approximately 1,000 feet past the southeast corner of the OMF South site. The tail tracks would allow trains to access the Link system from the south if the northern lead tracks were out of service. Train speeds would be less than 5 mph because the trains would be coming to a stop to allow them to reverse direction and head north.

In addition to the mainline and tail tracks, a 0.9-mile test track would run parallel to the east side of the mainline tracks from S 324th Street to just south of S 336th Street. The test track would be at the same elevation as the mainline tracks, except for the north end of the track near S 324th Street, where the test track would be at grade and the mainline tracks would be elevated. A small (1,000-square-foot) building near the test track would include a breakroom and facilities for employees.

OMF South Site

The Preferred Alternative site is approximately 66 acres. It includes the OMF building, the MOW building, the Link System-Wide Storage building, storage tracks, parking, training tracks, and yard areas. There would be approximately 480 parking spaces, including spaces for employees, visitors, accessible parking, and nonrevenue Sound Transit vehicles. The yard area would be approximately 6.7 acres. Figure 2.3-4 shows a conceptual layout (note that storage tracks are labeled OMF Tracks in the figure).

Lead tracks would allow LRVs to access the mainline tracks. Two elevated lead tracks would extend from the northeast corner of the site to the mainline tracks and would each be approximately 800 feet long. Similarly, two elevated lead tracks, each approximately 1,000 feet long, would extend from the southeast corner of the site connecting to the tail tracks.

Preferred Alternative

OMF South

The Preferred Alternative would include a replacement for 20th Avenue S along the west side of the site that would extend 18th Place S from S 336th Street to S 340th Street. Additionally, 21st Avenue S would be extended south to a new intersection with S 344th Street. The cul-de-sac at the eastern end of S 344th Street would move west to avoid the new tail tracks. If the Preferred Alternative is selected to be built, Sound Transit would continue to explore site designs to minimize ecosystem impacts, which could include modifying the locations of buildings, track, and 18th Place South within the site boundaries. Appendix K contains a discussion of a potential Preferred Alternative design refinements that could reduce ecosystem impacts.

2.3.2.2 South 344th Street Alternative

The South 344th Street Alternative is in Federal Way between S 336th Street and S 344th Street and between I-5 and 18th Place S.

Mainline Tracks

The South 344th Street Alternative requires approximately 1.8 miles of connecting mainline tracks from the Federal Way Downtown Station to the site, including a tail track. As with the Preferred Alternative, these tracks would also serve as revenue mainline tracks if TDLE is constructed as proposed. The 40 mph Alignment (Preferred) and the 55 mph Design Option are the same as described for the Preferred Alternative. The South 344th Street Alternative also includes a test track and a test track facility that would be the same as described for the Preferred Alternative.

As with the Preferred Alternative, tracks would extend past the southeast corner of the site to serve as tail tracks. These tail tracks would allow trains to access the Link system from the south if the northern lead tracks were out of service. Train speeds would be less than 5 mph because the trains would be coming to a stop to allow them to reverse direction and head north. There are two options for the South 344th Street Alternative tail tracks that correspond with design alternatives for TDLE: the Enchanted Parkway alignment and the I-5 alignment. Both options are completely elevated, with the Enchanted Parkway alignment extending approximately 1,100 feet south of the site and the I-5 alignment extending approximately 1,400 feet south of the site.

OMF South Site

The South 344th Street Alternative site is approximately 64 acres. It includes the OMF building, the MOW building, the Link System-Wide Storage building, storage tracks, training tracks, parking, and yard areas. There would be approximately 480 parking spaces, including spaces for employees, visitors, accessible parking, and spaces for nonrevenue Sound Transit vehicles. The yard area would be approximately 8.2 acres. Figure 2.3-5 shows a conceptual layout.

The site would also require lead tracks for vehicles to access the mainline tracks. The elevated lead tracks would leave the northeast corner of the site and be approximately 1,100 feet long. Similarly, approximately 1,600 feet of elevated lead tracks would leave the southeast corner of the site to connect to the mainline tail tracks for the Enchanted Parkway alignment; approximately 1,300 feet of elevated lead tracks would be needed to connect the site to the mainline tail tracks for the I-5 alignment.

OMF South

2.3.2.3 Midway Landfill Alternative

The Midway Landfill Alternative is in Kent between S 246th Street and S 252nd Street and between I-5 and SR 99.

Mainline Tracks

Because the site would be adjacent to FWLE, which is scheduled to open as an active light rail line prior to the opening of OMF South, there would be no need to build additional mainline tracks. Unlike the Preferred and South 344th Street alternatives, the Midway Landfill Alternative would not include a test track because of the varying grades of the existing mainline tracks. Instead, it is anticipated that LRV testing would continue to occur on the mainline tracks.

OMF South Site

The programmed site area of the Midway Landfill Alternative is approximately 68 acres. It includes the OMF building, the MOW building, the Link System-Wide Storage building, storage tracks, training tracks, parking, and yard areas. There would be approximately 480 parking spaces, including spaces for employees, visitors, accessible parking, and nonrevenue Sound Transit vehicles. The yard area encompasses approximately 8.3 acres. Figure 2.3-6 shows a conceptual site layout. There are three subsurface construction design options for the Midway Landfill Alternative, discussed further in Section 2.3.5, Midway Landfill Site Subsurface Construction Design Options.

The Midway Landfill Alternative would connect to the mainline tracks via a series of lead tracks between the Kent/Des Moines and South 272nd Street stations. An approximately 3,200-foot-long lead track would run parallel to the FWLE mainline tracks, and five shorter (approximately 400 foot-long) lead tracks would connect it to the site. The lead track parallel to FWLE would be elevated for approximately 35 percent of its length; the shorter lead tracks would be primarily at grade.

2.3.3 Overview of Construction Approach

This section provides an overview of potential construction activities and timing that would apply to each build alternative. Activities include civil construction (which includes site preparation, primary construction, and finish construction), systems installation, testing, and startup activities.

Major civil construction activities are:

- Demolition (buildings, pavement)
- Clearing and vegetation removal
- Installing erosion/siltation controls
- Site grading, fill, compaction, and excavation
- Hauling debris and excavated material
- Importing fill, building materials, and equipment
- Utility extensions, relocations, or disruptions
- Stormwater drainage system improvements
- Construction activity in or near water bodies or sensitive areas
- Contaminated soil and water management
- Elevated structure construction
- Retaining wall construction
- Pile driving or drilling shafts
- Temporary partial or full roadway and lane closures and detour routes
- Temporary partial or limited access to properties
- Building construction
- Track and overhead catenary system (trolley wire) construction
- Constructing temporary roadways for access to and through the construction site
- Constructing new and improving existing roadways
- Landscaping

2.3.4 Construction Methods, Sequence, and Activities

Sound Transit would develop a construction plan during project design to establish the various construction phases and contracts, their estimated schedule and duration, and appropriate sequencing. Sound Transit is currently planning to use a design-build delivery method. Under design-build, one firm completes final design and construction of the project.

While all alternatives would require utility relocation, a noteworthy relocation required for the Preferred and South 344th Street alternatives involves the Bonneville Power Administration (BPA) towers near S 324th Street. The proposed mainline track alignment crosses under the transmission lines just east of the 23rd Avenue S and S 324th Street intersection. The BPA lines would need to be raised to provide the necessary clearance between the top of the mainline track rail to the lowest sag of the transmission line. BPA determined that the existing towers could not be modified, and four new towers would be needed to raise the lines.

Typical construction would occur on a 5- to 6-day workweek schedule, primarily during daytime hours. In some situations (such as when street detours are involved or when daytime construction periods need to be shortened to reduce impacts), additional shifts, all-week, nighttime, or 24-hour construction activities could be necessary. Table 2.3-1 shows the anticipated durations of the site preparation and facility construction phases for each alternative. These phases would overlap to varying degrees depending on the alternative.

Table 2.3-1 Estimated OMF South Construction Durations

Alternative	Site Preparation	Facility Construction	Total[1]
Preferred Alternative	1 year, 5 months	2 years, 3 months	3 years, 4 months
South 344th Street	1 year, 6 months	2 years, 4 months	3 years, 5 months
Midway Landfill – Platform	4 years, 1 month	2 years, 3 months	6 years, 2 months
Midway Landfill – Hybrid	5 years, 7 months	3 years, 1 month	8 years, 8 months
Midway Landfill – Full Excavation	4 years, 4 months	2 years, 9 months	7 years, 1 month

Note:

(1) Duration totals reflect the overlap of some site preparation and facility construction activities and rounding of months.

Grading and excavation would reuse suitable excavated soils as on-site embankment when feasible. Excess excavated material would be removed and hauled to a permitted disposal site. Truck hauling would require a loading area, staging space for trucks awaiting loading, and provisions to prevent tracking soil on public streets. Truck haul routes would require coordination with local jurisdictions and potentially the Washington State Department of Transportation (WSDOT). This would allow surface hauling activities to be concentrated during daytime periods to minimize potential impacts from noise on sensitive receptors such as residences, or to avoid peak traffic periods. Truck haul routes are summarized in Section 3.2, Transportation, and are discussed in detail in Appendix G1, Transportation Technical Report. Section 3.12, Geology and Soils, discusses the estimated excavation and fill volumes for each build alternative.

2.3.5 Midway Landfill Site Subsurface Construction Design Options

Public interest in pursuing the Midway Landfill as a potential OMF South site was raised early in the scoping process. The site has several favorable attributes: it’s a mostly vacant site in an appropriate location within the Link system (South Corridor and adjacent to mainline tracks that will be operational when the facility opens); it’s publicly owned and operated by Seattle Public Utilities (SPU); and it would provide an opportunity to put a U.S. Environmental Protection Agency (EPA)-designated Superfund cleanup site back into productive use.

There are also risks involved with the site. It is a former landfill. There is a cap to control hazardous emissions and reduce surface water infiltration, and there is an active methane gas extraction system. As time passes, decomposition of waste in the landfill is causing settling at different rates, which creates engineering challenges as well as concerns for safety during construction and long-term operation and maintenance. Finally, as a Superfund site, the Midway Landfill is under active monitoring and reporting to ensure that the cleanup measures continue to function as planned. See Section 3.13, Hazardous Materials, for more discussion of the history of the landfill and the cleanup efforts.

SPU submitted comments during the Scoping period for the 2021 SEPA Draft EIS, indicating an interest in exploring options to develop the site for the proposed OMF South. Kent and Federal Way expressed similar interest.

In 2019, Sound Transit conducted two workshops with representatives from SPU, WSDOT, Kent, Federal Way, and Seattle to discuss how to identify potential design options to address differential settlement on the landfill in anticipation of its potential use as an OMF. Based on the workshops Sound Transit developed five potential subsurface construction design options for building an OMF on the landfill, all of which would be compatible with the current FWLE design. These options are documented in the Midway Landfill Site Engineering Optimization Report (Appendix D1). After further analysis — including consideration of compatibility for the connection to the FWLE mainline tracks and a strong preference for tracks to be built on a slab at grade to provide long-term stability — Sound Transit narrowed the number of potential subsurface construction design options to three. These three subsurface construction design options, designated as Platform, Hybrid, and Full Excavation, are discussed in more detail in Appendix D3, Conceptual Landfill Site Reuse Plan. Sound Transit did not identify a recommended subsurface construction design option.

Table 2.3-2 lists the site preparation requirements for each subsurface construction design option.

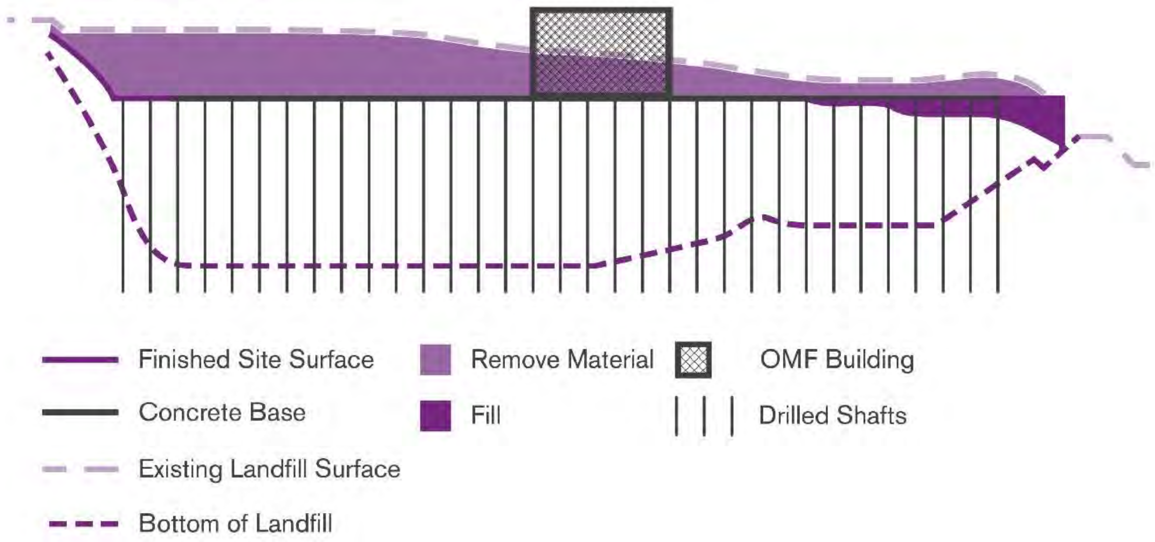
Table 2.3-2 Midway Landfill Preparation Material Requirements

Subsurface Construction Design Option	Excavation (cubic yds)	Material Removed from Site (cubic yds)	Total Fill Required (cubic yds)	On Site Material Available for Reuse as Fill (cubic yds)	New Fill Material Required (cubic yds)	Concrete Import (cubic yds)
Platform	1,010,000	670,000	340,000	340,000	0	531,000
Hybrid	4,270,000	2,560,000	2,950,000	1,710,000	1,240,000	165,000
Full Excavation	4,870,000	2,920,000	3,560,000	1,950,000	1,610,000	0

Platform

Under this subsurface construction design option, OMF South would be built on a 3.5-foot-thick concrete platform supported on approximately 700 drilled shafts. The platform would be approximately 35 acres. The concrete-filled drilled shafts would be approximately 10 feet in diameter, distributed on an approximately 35-foot by 70-foot grid under the buildings, track and drainage vault area. Average shaft lengths would range from 120 feet to 180 feet below finished grade. Due to the number of drilled shafts, this subsurface construction design option would require removing the entire soil and geomembrane cap system that overlays the landfill and replacing it after the shafts have been installed. The platform would then be constructed on top of the new cap, which would be designed to meet the regulatory requirements for the remedial controls to contain the landfill waste and hazardous emissions and to prevent precipitation from reaching the buried refuse where it could contaminate groundwater. Depending on the final elevation of the platform, lead tracks from the site may need to be elevated to connect to the FWLE mainline.

Pits, approximately 6 feet deep, would be built within the concrete platform to access the underside of the LRVs. These pits would be necessary for each of the subsurface construction design options. Conduits under the concrete platform would run utility lines for maintenance access. Figure 2.3-7 is a cross section of the Platform subsurface construction design option.



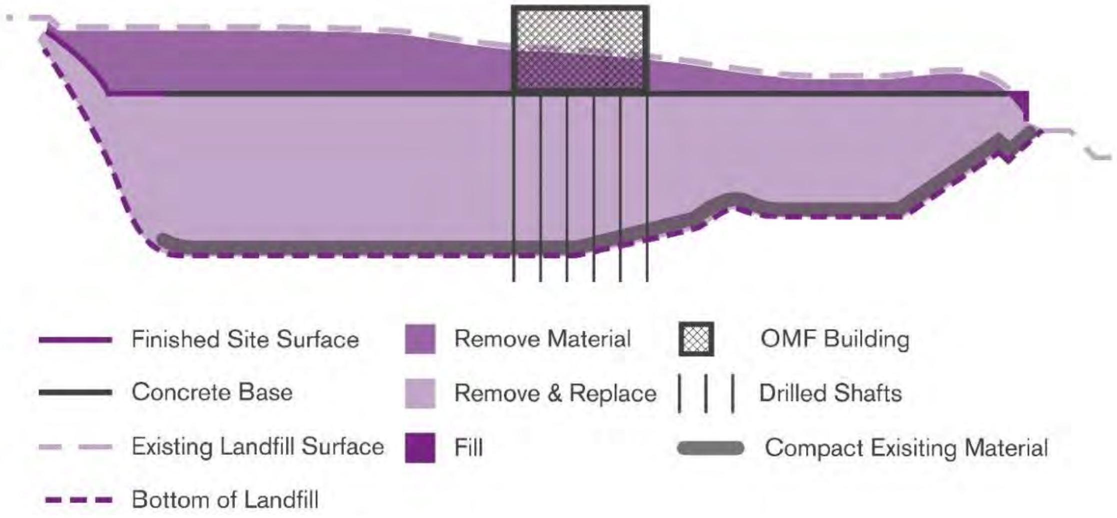
Finished Site Surface
Concrete Base
Existing Landfill Surface
Bottom of Landfill
Remove Material
Fill
OMF Building
Drilled Shafts

Figure 2.3-7 Platform Subsurface Construction Design Option Cross Section

Hybrid

Under this subsurface construction design option, the entire landfill cap system would be removed and replaced. Approximately 4.3 million cubic yards of loose landfill material would be excavated, and a ground improvement process called deep dynamic compaction would be used to prepare the site for construction. Excavated material would be screened to determine if it is suitable for reuse. If the material passes the screening, it would be kept on site. Unsuitable material would be exported for approved offsite disposal.

The Hybrid subsurface construction design option includes a 1-foot-thick concrete slab over a 3-foot-thick beam system built to support facilities sensitive to settlement, including tracks, parking, and roads. This slab and beam system would be about 30 acres. Approximately 110 concrete-filled drilled shafts would provide additional building support where needed. Approximately 1.2 million cubic yards of loose material would be brought to the site. Figure 2.3-8 is a cross section of the Hybrid subsurface construction design option.



Finished Site Surface
Concrete Base
Existing Landfill Surface
Bottom of Landfill
Remove Material
Remove & Replace
Fill
OMF Building
Drilled Shafts
Compact Exisiting Material

Figure 2.3-8 Hybrid Subsurface Construction Design Option Cross Section

Full Excavation

This subsurface construction design option was designed to completely excavate the landfill and backfill it with soil that the OMF would be built on. Excavation of the landfill would produce roughly 4.9 million cubic yards of loose material, 3.0 million cubic yards of which would be hauled to an approved disposal site. Approximately 1.6 million cubic yards of suitable soil would be imported. Figure 2.3-9 is a cross section of the Full Excavation subsurface construction design option.

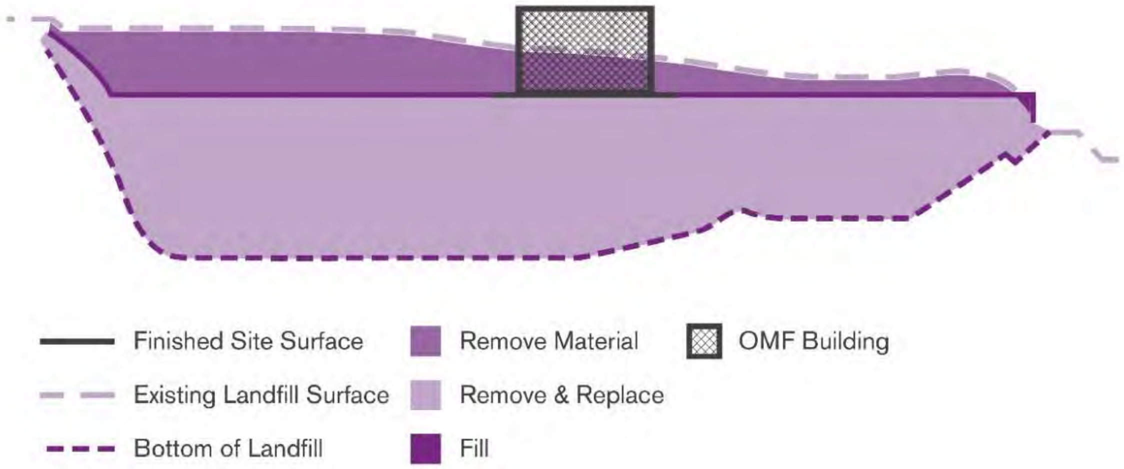


Figure 2.3-9 Full Excavation Subsurface Construction Design Option Cross Section

2.3.6 Staging Areas and Construction Easements

Construction activities would primarily be within the limits of the property being acquired for the project. Temporary construction easements would be necessary in limited locations along the boundaries of some of the alternative sites, mainline, and lead tracks.

2.4 Environmental Commitments and Sustainability

Sound Transit views environmental stewardship as a responsibility of all employees, contractors, and consultants. To that end, the agency integrates environmental ethics and sustainable business practices into its planning, design, construction, and operations.

The agency goes beyond regulation in its commitment to environmental stewardship and sustainability. Sound Transit's Environmental Policy states that the agency will satisfy all applicable laws and regulations and mitigate environmental impacts consistent with Sound Transit's policies, as well as strive to exceed compliance, restore the environment, avoid environmental degradation, and prevent pollution and conserve resources (Sound Transit 2004). Sound Transit's 2007 Sustainability Initiative builds on this and identifies sustainability objectives as also addressing social and economic development issues.

Sound Transit implements these commitments through a certified ISO 14001 Environmental and Sustainability Management System. The Board-approved long- and short-term goals for the management system's environmental and sustainability objectives are found in Sound Transit's 2015 and 2019 Sustainability Plan updates (Sound Transit 2019f). Examples of environmental or best management practices that are integrated into the project design and implementation include measures to minimize project impacts, such as stormwater control, appropriate compensation for affected properties, due diligence work to address hazardous materials, and construction plans that keep the community informed. As part of the preliminary engineering for the OMF South project, Sound Transit is continuing to investigate project-specific opportunities to contribute towards Sound Transit's goal of being carbon neutral by 2050.

In order to design the project for climate change resilience, in 2022 Sound Transit updated its 2013 Puget Sound Climate Change Science white paper to reflect the most recent scientific data available for the region. Sound Transit is also assessing how flood risk may affect resilience of the proposed design and design standards for the project alternatives. By assessing climate-related changes and vulnerabilities in the project planning stages, Sound Transit can include adaptation measures to support resilient infrastructure operations. Examples of potential adaptations include sizing culverts to accommodate future stream flows; installing sensors to monitor track temperatures, including air conditioning or shading around signal boxes; and raising ground-level infrastructure in areas of localized flooding.

In addition to meeting environmental commitments for its projects, Sound Transit seeks to avoid and minimize impacts where possible. To this end, Sound Transit will continue to explore design options for the Preferred Alternative, with a goal of further reducing environmental impacts. Where adverse impacts cannot be avoided, Sound Transit identifies potential measures to mitigate the adverse impacts to the extent feasible.

2.5 Funding and Opinion of Probable Cost

The opinion of probable cost is presented in ranges in Table 2.5-1. Cost estimates at this early phase of project development (approximately 10 percent design) are for comparative purposes only using a "Unit Cost Library" assembly methodology for cost estimating and do not represent the project budget. Sound Transit has developed high-level conceptual cost estimates for all alternatives evaluated in the Final EIS. Sound Transit establishes a project budget when design has advanced and a project's baseline budget and schedule is established prior to the start of construction.

The current level of project design includes uncertainties regarding the project scope, engineering data, mitigation requirements, schedule, and project delivery methods. To account for these uncertainties, the Opinion of Probable Cost is provided in a range. These conceptual estimates focus on the project elements that are defined consistently across alternatives, that capture the essential physical features of alternatives, and that help distinguish alternatives from one another.

In addition to the "Unit Cost Library" cost estimate, Sound Transit completed a more detailed estimate, applying a "bottoms up" cost methodology for the Preferred Alternative. Preliminary information from this methodology indicates cost growth of 33 percent attributable to the change in estimating methodology, inflation factors, market conditions, design development, and scoping changes. Sound Transit anticipates that the South 344th Street and Midway Landfill alternatives would have a similar increase if a "bottoms up" cost methodology was applied to those alternatives.

Capital projects across the Puget Sound region are experiencing the effects of inflationary factors including increases in the cost of materials and labor. Sound Transit employs Value Management evaluations and procurement strategies to establish final project budgets, supporting prudent expenditure of public funds. Each project estimate throughout the various design phases will therefore need to be evaluated and adjusted specifically considering current market conditions. This market conditions adjustment is independent of escalation and will fluctuate with economics and the value of any given project considered by the marketplace.

Table 2.5-1 Opinion of Probable Cost for Preliminary Engineering Design of the Build Alternatives

Alternative	Real Estate and Relocation[1]	Final Design and Construction[2]	Total Capital Preliminary Estimate	Annual Operating Estimate
Preferred Alternative				
Mainline Track	$19 M to $22 M	$338 M to $427 M	$356 M to $449 M	$1.2 M
OMF Site	$155 M to $186 M	$1.3 B to $1.7 B	$1.5 B to $1.8 B	$12 M
South 344th Street Alternative				
Mainline Track	$25 M to $59 M	$503 M to $636 M	$528 M to $695 M	$1.5 M
OMF Site	$147 M to $176 M	$1.3 B to $1.7 B	$1.5 B to $1.9 B	$12 M
Midway Landfill Alternative[3]				
Platform	$44 M to $52 M	$2.8 B to $3.5 B	$2.8 B to $3.5 B	$13 M
Hybrid	$44 M to $52 M	$2.2 B to $2.8 B	$2.3 B to $2.9 B	$13 M
Full Excavation	$44 M to $52 M	$2.1 B to $2.6 B	$2.1 B to $2.7 B	$13 M

Notes:

(1) All cost estimates are reported in 2023 dollars. They do not account for future escalation of construction or operational costs. This estimating methodology and accuracy is consistent with AACE International, Inc. for projects at the 10 percent level of design.

(2) Design and construction costs based on Sound Transit's Unit Cost Library values.

(3) The Midway Landfill Alternative does not include a test track.

The opinion of probable cost includes the following elements:

- Construction, including demolition and work to prepare the site (e.g., earthwork); trackway/mainline; train control electrical, signal, and communication systems; maintenance and administrative facilities; and associated improvements.
- Property acquisition, including relocation assistance.
- Design, permitting, agency administration, and program management.

In addition, estimates for construction change orders and an unallocated contingency were made as a percentage of the above estimates. Estimates for annual operating costs include long-term expenses to maintain the property, buildings, and other facilities as well as operating costs for the trains to deploy each morning before passenger service begins and return to the OMF each night after passenger service has shut down. Annual maintenance expenses for the mainline tracks for the Preferred and South 344th Street alternatives would apply until TDLE is completed. The annual operating cost estimates for the Midway Landfill Alternative are higher than those for the Preferred or South 344th Street alternatives because it would likely require additional annual expenses to mitigate for potential risks posed by settlement and methane gas over the lifespan of the facility. In addition, the Midway Landfill Alternative would have higher operating costs for the trains to deploy each morning before passenger service begins and return to the OMF each night after passenger service has shut down because it would be farther from the proposed southern terminus of TDLE compared to the Preferred and South 344th Street alternatives.

2.6 Next Steps and Schedule

FTA and Sound Transit prepared this Final EIS that documents and responds to substantive comments received on the 2021 SEPA Draft EIS and the 2023 NEPA Draft/SEPA Supplemental Draft EIS. The Board will next consider the alternatives evaluated in the Final EIS and select the project to be built.

FTA is also anticipated to publish a Record of Decision (ROD) for the project, which will document its findings as to whether the project has met the requirements of NEPA and related environmental regulations. The ROD will describe FTA's environmental determination on the project, the alternatives considered, the basis for the decision to approve the project, and the required mitigation measures. Issuance of the ROD completes FTA's NEPA process and is a prerequisite for federal funding or approvals.

Because SEPA requires that the Board's final decision on the project be informed by the Final EIS, the Final EIS must be issued independently of the ROD so that Sound Transit's decision can later be incorporated into the ROD. As a result of these regulatory requirements under SEPA, it will not be practical to issue a combined Final EIS and ROD, and they will be issued as separate documents.

After the Board selects the project to be built and FTA issues a ROD, Sound Transit will initiate the final design process, proceed with property acquisition, conduct construction planning, and apply for other permits and approvals. During final design, project elements will be further defined, including, but not limited to, the site orientation, number of buildings, mainline height, stormwater facilities, utility relocations, and staging areas.

All build alternatives would need approval from the Federal Highway Administration (FHWA) to construct and operate lead or mainline tracks within the interstate right-of-way. If the Board selects to build the Preferred Alternative or the South 344th Street Alternative, BPA would require environmental review for the relocation of their facilities in Federal Way. Regulatory agencies and local jurisdictions issuing permits for the project may use and rely on this environmental review to satisfy their NEPA and SEPA requirements.

2.6.1 Project Schedule

The project schedule is shown in Table 2.7-1. The current schedule is to begin final design and construction in 2024. The forecasted in-service date is 2032 for the Preferred Alternative, but Sound Transit is also pursuing measures to advance the opening earlier (potentially 2030). The Final EIS analysis evaluates the potential environmental impacts of OMF South at full buildout.

Table 2.7-1 Project Schedule

Preliminary Design and Environmental Review	Time Period
Early Scoping and Public Outreach	Spring to Fall 2018
Environmental Scoping	Spring 2019
Sound Transit Board Identifies SEPA Draft EIS Alternatives	May 2019
2021 SEPA Draft EIS Published	March 2021
2021 SEPA Draft EIS Comment Period	March 5 to April 19, 2021
Sound Transit Board Identifies Preferred Alternative	December 16, 2021
FTA Assumes Federal Lead Agency Status under NEPA	March 2023
NEPA Draft/SEPA Supplemental Draft EIS Published	September 22, 2023
Final EIS Published	June 7, 2024
Sound Transit Board Selects Project to Be Built	2024
FTA Issues Record of Decision	2024
Final Design, Construction, and Operation Targets[1]	
Final Design, Permitting, and Construction	2024 to 2037
OMF South Forecasted In-Service Date	2032 to 2037

Notes:

(1) The dates are presented in a range to reflect the schedule for all build alternatives.

2.6.2 Benefits and Disadvantages of Delaying Project Implementation

As required by SEPA, this section discusses the benefits and disadvantages of delaying the proposed project instead of approving it now.

Delaying the project would postpone impacts associated with project construction but would also postpone realizing a major component of the region's long-range plans for managing growth and transportation and the opportunity to link neighborhoods to Puget Sound regional employment centers.

There are several disadvantages of delaying implementation of the proposed project:

- A delay would compromise Sound Transit's ability to receive, test, and commission additional LRVs and therefore could delay the opening of light rail extensions under Sound Transit 3, including extensions to Tacoma and West Seattle.
- Delaying OMF South would require Sound Transit to operate the expanded system at a lower level of service than planned and/or delay some or all of the planned Sound Transit 3 light rail extensions until additional operations and maintenance capacity is developed. Degraded levels of service could include increased headways (less frequent trains serving stations) and decreased passenger capacity (operating three-car rather than four-car trains).
- Lower service levels and less light rail passenger capacity could result in fewer commuters using transit and secondary impacts on bus transit service in those corridors planned to be served by Link light rail. Those commuters may continue using automobiles instead, resulting in greater vehicular and greenhouse gas emissions.
- A delay in the proposed project would delay construction expenditures within the local and regional economy and the benefits that flow from such spending.
- Delaying the proposed project would likely result in higher construction costs due to inflation.

3 AFFECTED ENVIRONMENT, ENVIRONMENTAL IMPACTS, AND MITIGATION MEASURES

3.1 Introduction

This chapter discusses the affected environment, impacts, and mitigation measures for each element of the environment. Each section contains a brief introductory description of the subject matter along with a description of the study area for that element of the environment, followed by three sections: affected environment, environmental impacts, and mitigation measures.

The affected environment section includes a description of the potentially impacted resources within the study area. The environmental impacts section discusses impacts to the environment in the following order: No-Build Alternative, long-term impacts (for all build alternatives), construction impacts (for all build alternatives), avoidance and minimization of impacts, and indirect impacts. The mitigation measures section describes proposed steps to address the identified environmental impacts.

The extent of the study area for the OMF South project depends on the environmental resource being evaluated and is described for each resource. Typically, the study area consists of the construction limits for the Preferred, South 344th Street, and Midway Landfill alternatives and the surrounding area, though for some resources (for example, Air Quality and Greenhouse Gas Emissions) impacts are evaluated at a regional level. For many resources, the Preferred and South 344th Street alternative study areas, including proposed mainline tracks, overlap and discussions are combined. For other resources, the Preferred and South 344th Street alternative study areas are discussed separately in order to better differentiate potential impacts between the two alternatives.

3.2 Transportation

This section describes the existing transportation environment and potential impacts associated with the OMF South project alternatives. It evaluates the potential operational and construction impacts of OMF South, including the traffic activity from employees coming to and departing from the site and truck trips and haul routes needed during construction. For the transportation analysis, two study areas were defined. Due to their close proximity and anticipated impacts to similar intersections, a single study area was identified for the Preferred and South 344th Street alternatives. The study area for the Preferred and South 344th Street alternatives includes the proposed mainline in addition to the OMF and lead tracks connecting to the mainline. The elevated mainline track for the Preferred and South 344th Street alternatives would cross several roadways within the study area. Because all of these crossings would be grade separated from the mainline, there would not be impacts to traffic operations. A second study area, which includes the OMF site and lead tracks connecting to existing mainline, was identified for the Midway Landfill Alternative.

A more detailed discussion of the affected environment and impacts to transportation resources is provided in Appendix G1, Transportation Technical Report.

3.2.1 Affected Environment

3.2.1.1 Transportation Network

Preferred and South 344th Street Alternatives Study Area

All streets in the Preferred and South 344th Street alternatives study area are in Federal Way. The street network and classifications in the study area include arterial, collector, and local streets. Speed limits range from 25 to 40 miles per hour (mph), with the exception of I-5, which has a speed limit of 60 mph through the study area.

Nine intersections were analyzed in the Preferred and South 344th Street alternatives study area. They include uncontrolled intersections and those controlled by a traffic signal or stop signs. Figure 3.2-1 shows the Preferred and South 344th Street alternatives study area and street network. Figure 3.2-2 shows the nine intersections studied for the Preferred and South 344th Street alternatives.

Midway Landfill Alternative Study Area

The street network and classifications in the Midway Landfill Alternative study area include arterial, collector, and local streets, all of which are in Kent. Speed limits range from 25 to 45 mph, except for I-5, which has a speed limit of 60 mph through the study area. Figure 3.2-3 shows the Midway Landfill Alternative study area and street network. Figure 3.2-4 shows the intersections studied for the Midway Landfill Alternative.

Nine intersections in the Midway Landfill Alternative study area were originally analyzed in the 2021 SEPA Draft EIS. They include uncontrolled intersections and those controlled by a traffic signal or stop signs. However, Kent does not require analysis of commercial driveways on the east side of SR 99 unless there is a direct impact on a public right-of-way on the west side of SR 99. Therefore, the analysis of intersections 2 through 4 is not described here but is included in Appendix G1, Transportation Technical Report. All other intersections are summarized below.

FIGURE 3.2-4
Study Area Analysis Intersections
Midway Landfill Alternative

OMF South

3.2.1.2 Arterial and Street Operations

Within the study areas, intersections were chosen for analysis based on their potential to be directly affected, such as by a change in channelization, signal control, or station trips, as well as their potential to be indirectly affected by changes in volume due to trips accessing the system. Intersections were classified as signalized, stop controlled, or uncontrolled. All intersection operations were analyzed in the AM and PM peak periods. The AM peak period is between 6 and 9 a.m. and the PM peak period is between 3 and 6 p.m.

Traffic operations were measured using the LOS method, which is defined in terms of average intersection delay on a scale ranging from A to F, depending on the delay conditions at the intersection. LOS A represents the best conditions with minimal delay, and LOS F represents the worst conditions with severe congestion. Table 3.2-1 summarizes the criteria used to define LOS.

Table 3.2-1 Average Control Delay Used in Level of Service

LOS[1]	Signalized Intersections (seconds per vehicle)	Unsignalized Intersections (seconds per vehicle)	Traffic Flow Characteristics (seconds per vehicle)
A	< 10	< 10	Virtually free flow; completely unimpeded
B	> 10 and < 20	> 10 and < 15	Stable flow with slight delays; less freedom to maneuver
C	> 20 and < 35	> 15 and < 25	Stable flow with delays; less freedom to maneuver
D	> 35 and < 55	> 25 and < 35	High density but stable flow
E	> 55 and < 80	> 35 and < 50	Operating conditions at or near capacity; unstable flow
F	> 80	> 50	Forced flow; breakdown conditions

Source: Highway Capacity Manual 2010 (Transportation Research Board 2010)

Note:

(1) The LOS criteria are based on control delay, which includes initial deceleration delay, final deceleration delay, stopped delay, and queue move-up time.

Traffic operations were also measured by volume-to-capacity (v/c) ratio, defined as a fraction representing the ratio of traffic volume to the capacity of a given roadway. The v/c ratio is measured on a decimal scale, with 0.0 representing excessive capacity and anything greater than 1.0 representing congestion where volume has exceeded roadway capacity. A v/c ratio can be calculated for either the intersection as a whole or by approach. Table 3.2-2 shows the relationship between v/c ratio and the aforementioned LOS analysis procedure by average vehicle delay.

Table 3.2-2 Planning and Operational Level of Service

Analysis Procedure	LOS A	LOS B	LOS C	LOS D	LOS E	LOS F
Planning (v/c ratio)	0.00–0.60	0.61–0.70	0.71–0.80	0.81–0.90	0.91–1.00	>1.00
Operational delay(s) (seconds per vehicle)	0–10	10–20	20–40	40–60	60–80	>80

Sources: Interim Materials on Highway Capacity (Transportation Research Board 1980) and Highway Capacity Manual 2000 (Transportation Research Board 2000)

Impact Thresholds

WSDOT, Federal Way, and Kent have established LOS or v/c standards, shown in Table 3.2-3. These standards are used to determine whether mitigation is warranted for projects that impact arterial and street operations by comparing the overall intersection LOS and v/c ratios for the No-Build Alternative and the build alternatives. Impacts would occur if the build alternatives would result in traffic operations performing below the acceptable LOS or v/c ratio when the intersection or roadway segment would operate at or above the acceptable LOS or v/c ratio under the No-Build Alternative. Impacts may also occur if traffic operations under the build alternative reduce the LOS from E to F or if the delay in an LOS F condition is worsened by more than 10 seconds.

Table 3.2-3 Level of Service Standards

Agency	AM LOS Standard or V/C Ratio	PM LOS Standard or V/C Ratio
WSDOT	• LOS D for Highways of Statewide Significance (e.g., SR 99)	• LOS D for Highways of Statewide Significance
Federal Way	Not applicable	• 1.2 v/c ratio for signalized intersections outside of City Center • 1.0 v/c ratio for unsignalized intersections outside of City Center
Kent	Not applicable	• LOS E for non-SR 99 corridors • WSDOT LOS standard for SR 99

Note:

(1) Federal Way and Kent do not have LOS or v/c standards for AM peak period operations.

Current Levels of Service

In the Preferred and South 344th Street alternatives study area, all intersections operate at or better than WSDOT LOS standards for the roadway in the AM peak hour. The intersection at SR 99/S 336th Street (intersection #2) currently operates at LOS E in the PM peak hour, which is below WSDOT standards. All intersections in the Midway Landfill Alternative study area operate at or better than WSDOT and Kent standards for the roadway in the AM peak hour. The intersection at SR 99/S 248th Street (intersection #5) currently operates at LOS E in the PM peak hour, which is below WSDOT standards.

3.2.1.3 Freight

WSDOT has designated roadways as freight routes and has classified them based on the annual tonnage that is transported along a road in a particular year. This classification system is called the Freight Goods Transportation System. The classifications range from roadways that carry more than 20,000 tons in 60 days to more than 10 million tons annually, as summarized in Table 3.2-4. Existing freight routes within the study areas are shown in figures provided in Appendix G1, Transportation Technical Report.

Table 3.2-4 Freight Goods Transportation System Classification System

FGTS Classification	Annual Gross Tonnage
T-1	Over 10,000,000
T-2	4,000,000 to 10,000,000
T-3	300,000 to 4,000,000
T-4	100,000 to 300,000
T-5	Over 20,000 in 60 days

Source: WSDOT 2020

Preferred and South 344th Street Alternatives Study Area

There are three designated freight routes in the Preferred and South 344th Street alternatives study area: I-5 is designated as a T-1 route, SR 99 is designated as a T-3 route, and 23rd Avenue S from S 322nd Street to S 324th Street is designated as a T-3 route. Federal Way also designates SR 99 and 16th Avenue S as freight routes.

Midway Landfill Alternative Study Area

There are four designated freight routes in the Midway Landfill Alternative study area: I-5 is designated as a T-1 route, and SR 99, S 259th Place, and S 260th Place are designated as T-3 routes. Kent also designates SR 99 as a freight route.

3.2.1.4 Transit

King County Metro Transit (Metro), Sound Transit, and Pierce Transit provide service in and through the study areas, with regional and local bus fixed-route service to transit centers, park-and-rides, and bus stops. Bus stops are primarily on SR 99, but also include some stops on 20th Avenue S, S 336th Street, and 16th Avenue S. Neither light rail nor commuter rail service is currently provided. Existing transit routes are shown in figures provided in Appendix G1, Transportation Technical Report.

Preferred and South 344th Street Alternatives Study Area

Metro Routes 177, 182, 193, and 903 and Pierce Transit Routes 402, 500, and 501 provide bus service in the Preferred and South 344th Street alternatives study area. These routes provide both peak-only and all-day bus service. The Federal Way/S 320th Street Park & Ride is within the Preferred and South 344th Street alternatives study area. It is served by Metro routes 177, 182, 193, and 903 and Pierce Transit routes 402, 500, and 501. Parking is available and free for transit customers. It has 877 spaces and had a utilization rate of 1.3 percent in the first quarter of 2023 (King County Metro 2023).

Midway Landfill Alternative Study Area

Metro Route 165 and the RapidRide A Line provide all-day bus service in the Midway Landfill Alternative study area.

3.2.1.5 Nonmotorized Network

In general, the opportunities for nonmotorized (bicycle and pedestrian) circulation in the study areas are limited. Sidewalks are provided on most arterial streets, and marked crosswalks are provided at signalized intersections. I-5 restricts most opportunities for pedestrian and bicycle connections east of the study areas, and most east-west streets are dead ends. Each study area has only one crossing of I-5: S 336th Street in the Preferred and South 344th Street alternatives study area and S 259th Street in the Midway Landfill Alternative study area.

Preferred and South 344th Street Alternatives Study Area

In the Preferred and South 344th Street alternatives study area, north-south pedestrian circulation is provided via SR 99, 16th Avenue S, 18th Place S, 20th Avenue S, and 23rd Avenue S. East-west pedestrian travel is facilitated by S 324th Street, S 336th Street, S 340th Street, S 341st Place, and S 344th Street. Bicycle facilities in the Preferred and South 344th Street alternatives study area include eastbound and westbound bicycle lanes on S 336th Street, east of 20th Avenue S, and a greenway[1] on 20th Avenue S, S 341st Place, 18th Place S, and S 344th Street. Federal Way recently installed shared lane markings for bicycles on 25th Avenue S, north of the South 320th Park & Ride. Figure 3.2-5 shows the existing pedestrian and bicycle facilities within the Preferred and South 344th Street alternatives study area and its vicinity.

Midway Landfill Alternative Study Area

The Midway Landfill and other large developments restrict north-south nonmotorized circulation in the Midway Landfill Alternative study area north of S 252nd Street, and SR 99 provides the only north-south pedestrian connection between S 240th Street and S 252nd Street. The street network south of S 252nd Street has a more developed grid and offers better opportunities for nonmotorized circulation. East-west circulation is similarly restricted. While SR 99 is considered a shared bicycle facility, there are no designated bicycle facilities that travel within or through the Midway Landfill Alternative study area. Figure 3.2-6 shows the existing pedestrian and bicycle facilities within the Midway Landfill study area and its vicinity.

3.2.1.6 Parking

All private parking is associated with businesses in the study areas, and there are no pay-for-parking facilities. Several off-street private business parking lots are available for use by employees and patrons within the study areas.

Preferred and South 344th Street Alternatives Study Area

On-street parking is limited in the Preferred and South 344th Street alternatives study area. It is permitted between 8 a.m. and 6 p.m. on the west side of 18th Place S, north of S 341st Place; on the north side of S 341st Place; and on the south side of S 344th Street, east of 18th Place S. It is also permitted along 21st Avenue S, subject to weight restrictions.

Midway Landfill Alternative Study Area

Unrestricted (free, with no time restrictions) on-street parking is permitted on most residential streets south of the landfill property in the Midway Landfill Alternative study area. On-street parking is not permitted on SR 99, S 240th Street, S 259th Street, or S 260th Street.

---

[1] A greenway is a bicycle facility that consists of shared lane markings and guide signs along mostly residential or other low-speed or low-volume roads.

Midway Landfill Alternative

3.2.1.7 Safety

Historical collision data was collected from WSDOT for the 3-year period from January 2016 to December 2018. Over 60 percent of collisions in both study areas resulted in property damage only. Approximately 30 percent of collisions in each study area resulted in minor or possible injuries.[2] In both study areas, no notable mitigating factors were provided for the fatal and serious injury crashes other than two: one due to driver inattention and one due to driver disregard for a traffic signal. The top two common types of collisions in the study areas were rear end and angle (T-bone), respectively.

Preferred and South 344th Street Alternatives Study Area

During the 3-year period a total of 224 collisions occurred at intersections and roadway segments in the study area, with no fatal crashes and two serious injury crashes. The intersection at SR 99/S 336th Street had the highest number of collisions (64), followed by the SR 99/16th Avenue S intersection (45 collisions). Nineteen collisions occurred in the SR 99 business access transit lane, representing 30 percent of all roadway segment collisions.

Federal Way has established a collision threshold for intersections of 1 crash per million entering vehicles and a collision threshold for segments of 10 crashes per million vehicle miles traveled (City of Federal Way 2019). Locations exceeding the thresholds may indicate safety inadequacies as well as prioritized locations for safety.

Four intersections and no roadway segments in the Preferred and South 344th Street Alternatives study area exceed the collision rate thresholds for Federal Way:

- SR 99/S 336th Street
- SR 99/16th Avenue S
- SR 99/S 344th Street
- S 344th Street/18th Place S

Midway Landfill Alternative Study Area

During the 3-year period a total of 261 collisions occurred at intersections and roadway segments in the study area, including four fatal crashes and six serious injury crashes. Of these, two fatal crashes and two serious injury crashes occurred at the intersection of SR 99 and S 240th Street. The intersections at SR 99/S 240th Street, SR 99/S 260th Street, and SR 99/S252nd Street had the most collisions, with 56, 57, and 47 collisions, respectively. Collisions at these three intersections comprised 61 percent of the total collisions in the study area.

SR 99 between S 240th Street and S 260th Street had the most roadway segment collisions (63). Eleven collisions occurred in the SR 99 business access transit lane, representing 17 percent of total collisions along roadway segments.

---

[2] WSDOT defines minor injury as “One or more persons in a crash had a non-life threatening injury such as: lump on the head, abrasion, bruise, or minor laceration” and possible injury as “One or more persons in a crash had: momentary unconsciousness, claim of injury, limping, complaint of pain, or nausea. These injuries are those reported by the person or indicated by their behavior, but where no wounds or injuries are readily evident.”

3.2.2 Environmental Impacts

3.2.2.1 No-Build Alternative

Under the No-Build Alternative, impacts from construction and operation of OMF South would not occur. However, other planned projects would have impacts in the OMF South study areas. This includes TDLE, for which mainline track construction overlaps with the OMF South Preferred and South 344th Street alternatives. If TDLE is constructed as proposed, the mainline track associated with these OMF alternatives would be built later in time. Impacts associated with construction of the mainline track are addressed within the build alternatives impacts discussion below. All other TDLE-related impacts are addressed in Chapter 4, Cumulative Effects Analysis.

Arterial and Street Operations

Few improvements are planned by Federal Way and Kent that would alter the roadway network and intersections in the study areas under the No-Build Alternative. The following projects are planned by Federal Way in the Preferred and South 344th Street alternatives study area. Only the first project listed has secured funding.

- Add a southbound auxiliary lane on 16th Avenue S from S 344th Street to S 348th Street (the auxiliary lane from S 347th Street to S 348th Street is complete).
- Extend 20th Avenue S to S 344th Street.

In the Midway Landfill Alternative study area, the following projects are planned by Kent. Only the first project listed has secured funding.

- Construct two new streets, 32nd Avenue S from S 240th Street to S 244th Street and S 244th Street from SR 99 to 32nd Avenue S, including sidewalks and bike lanes.
- Change the signal phasing at the S 260th Street/SR 99 intersection to include flashing yellow arrows on the eastbound and westbound approaches as part of FWLE.
- Change the signal phasing at the S 240th Street/SR 99 intersection.
- Add westbound dual left-turn lanes and an eastbound right-turn pocket at the S 260th Street/SR 99 intersection.

Traffic volumes are forecast to increase throughout both study areas between existing conditions and the 2042 AM and PM peak hours. Future volumes under the No-Build Alternative were forecast for the Preferred and South 344th Street alternatives study area using a growth rate of 0.8 percent per year. Future volumes for the Midway Landfill Alternative study area used growth rates of 1.11 and 1.12 percent per year for AM and PM peak hour volumes, respectively.

The traffic operations analysis compared future traffic volumes under the No-Build Alternative at the same study intersections analyzed under existing conditions. Figures showing the forecast 2042 AM and PM peak hour operations and turning movements for the No-Build Alternative are provided in Appendix G1, Transportation Technical Report.

No intersections in the Preferred and South 344th Street alternatives study area are forecast to operate below the LOS or v/c ratio standards for the roadway during the 2042 AM or PM peak hours for the No-Build Alternative. LOS at the SR 99/S 336th Street intersection is forecast to slightly improve from LOS E to LOS D. This improvement is due to signal timing optimization.

In the Midway Landfill Alternative study area, the SR 99/S 248th Street intersection is forecast to operate at LOS F during the 2042 AM peak hour for the No-Build Alternative, which is below the WSDOT LOS standards for SR 99. This intersection currently operates at LOS D during the AM peak hour, which meets WSDOT LOS standards. During the 2042 PM peak hour, the SR 99/S 248th Street intersection is forecast to continue operating below the LOS standards, as it does under existing conditions, dropping to LOS F from its current operation at LOS E.

Freight

Under the No-Build Alternative, freight would experience the same levels of delay as general-purpose traffic on roadways and at intersections with increased congestion.

Transit

Under the No-Build Alternative, FWLE and TDLE would expand light rail service to Tacoma through the study areas, and other projects would expand service to Redmond, West Seattle, Ballard, Northgate, Lynnwood, Everett, south Kirkland, and Issaquah. Bus service on the northern and southern boundaries of the Midway Landfill Alternative study area is expected to increase with the opening of the Kent/Des Moines station near Highline College as part of FWLE. No additional service is planned on SR 99. Some additional bus service is planned along 16th Avenue S in the Preferred and South 344th Street alternatives study area. Metro plans to provide less peak-oriented bus service on I-5 through the study areas in 2042.

It is assumed that Sound Transit would reduce bus service levels on I-5 through the study areas in 2042 because Link light rail will replace much of the current north-south service from south Puget Sound cities toward downtown Seattle and the University District. Existing Sound Transit bus routes that currently provide service to cities north of Tacoma will generally be truncated at the Tacoma Dome and Fife Link stations, where riders will transfer to or from Link. It is also assumed that Pierce Transit would truncate bus service via Routes 402 and 500 in the Preferred and South 344th Street alternatives study area at frequencies comparable to those under existing conditions. Route 501 would be discontinued and would no longer provide service in the Preferred and South 344th Street alternatives study area.

Under the No-Build Alternative, Sound Transit would not have the capacity to receive, test, commission, store, maintain, and deploy the expanded fleet of LRVs needed to support existing and planned future expansions of the light rail system at planned service levels. As a result, light rail operations would be less efficient than they would otherwise be with the facility and Sound Transit would not be able to meet expected ridership demand.

Nonmotorized Network

Under the No-Build Alternative, pedestrian and bicycle facilities would be improved in accordance with adopted local plans. The Transportation Element of the Federal Way Comprehensive Plan calls for installation of bicycle lanes on S 336th Street between SR 99 and 20th Ave S and planned trails through the Federal Way/S 320th Street Park & Ride.

Nonmotorized volumes are expected to increase in the Midway Landfill Alternative study area as a result of land use regulations that encourage mixed uses and higher residential densities in Kent’s Midway Subarea. The Midway Subarea is located in the western portion of Kent and is bound to the north by SR-516 (Kent-Des Moines Road), to the south by South 272nd Street, and by the city of Des Moines along the entire western border. The Midway Subarea Plan envisions a conceptual, expanded pedestrian and bike path framework in the study area, including north-south improvements connecting S 244th Street to S 252nd Street through the conceptual layout of the Midway Landfill Alternative project site.

Parking

Under the No-Build Alternative, the quantity of on-street parking along streets within the study areas is not assumed to change. On-street parking utilization is expected to stay the same because the land uses within the study areas are not expected to change, as shown by the comprehensive plans for Federal Way and Kent. Any new developments within the study areas would be expected to provide adequate off-street parking for their use.

Safety

The expected increase in traffic volumes in the study area could increase collision frequencies for both motor vehicle and nonmotorized users in the study area. Planned roadway and intersection projects could improve safety through rechannelization, improved sight lines, or the addition of turn lanes. The construction of new bicycle and pedestrian facilities would improve safety and predictability for both motor vehicle and nonmotorized users in the study area by clearly identifying conflict points.

3.2.2.2 Long-Term Impacts

Impacts Common to All Build Alternatives

Arterial and Street Operations

For all build alternatives, all track crossings of existing or planned roadways would be elevated and would therefore not impact traffic operations. For the Preferred and South 344th Street alternatives, this applies to all mainline and tail track design options.

All access points to the OMF South sites would be controlled by fenced rolling gates, one of which would be at a guard house, with access to the site granted via guard house staff or by an automated system, such as electronic key cards. Two scenarios were evaluated to help understand how different gate operations could impact the local transportation system during the peak hour:

- Free-flow movement into each OMF South site without consideration of the effect of opening and closing the rolling gate.
- Vehicle movement into the site with consideration of estimated timing for each gate opening and closing. (This evaluation was completed without the use of the Synchro software because staffed guard houses and gate operations cannot be evaluated with the software.)

Approximately 610 people would be employed at the facility, arriving and departing over the course of three shifts. Employees would arrive at staggered times throughout each shift. A portion of the day and graveyard shift staffing estimates was assumed to enter/exit the OMF South site in the AM and PM peak hours, as shown in Table 3.2-5. All employees were assumed to arrive in single-occupancy vehicles to evaluate a worst-case scenario. The amount of freight traffic to and from the OMF South site is anticipated to be minimal, particularly during the AM and PM peak hours, because deliveries would primarily occur during off-peak hours. Therefore, freight traffic was not factored into the analysis.

The peak hour vehicle trips generated at the facility were assigned to study area roadways and intersections based on existing travel patterns. Existing trips from properties that would be acquired for the project under all alternatives were removed. Existing trips that would be affected by changes in the roadway network under the Preferred and South 344th Street alternatives were rerouted to other intersections or intersection movements. This resulted in a decrease in volume for some intersection movements in both study areas.

Table 3.2-5 Forecast Auto Volumes for the Build Alternatives 2042 AM and PM Peak Hours

Alternative	Inbound AM	Inbound PM	Outbound AM	Outbound PM
Preferred and South 344th Street Alternatives	69	0	11	57
Midway Landfill Alternative	69	0	11	57

Gate operations were assessed to determine whether intersections would be affected. The first gate operation scenario (without the gate opening and closing between vehicles) assumed free-flow movement into each site. Therefore, no additional queueing and delays would result at the gates, and no spillback would occur that could impact intersection operations.

The second scenario assumed the gates would open and close between vehicles. Assuming that 75 percent of inbound and outbound vehicles arrive at gate-managed driveways during a peak 15-minute period either before shift change (AM peak hour) or after shift change (PM peak hour), the access gates should have sufficient capacity to accommodate the inbound and outbound vehicles trips without additional queueing and delays that would impact intersection operations.

Because neither scenario resulted in queuing and delays associated with gate operations, the traffic operations presented in the following sections did not incorporate any impacts associated with access into each OMF South site.

Freight

The build alternatives are not anticipated to negatively affect truck circulation or truck routes on the local street network in the study area. There are no at-grade light rail track roadway crossings that would cause delays for trucks. Freight would experience the same levels of delay as general-purpose traffic on roadways and at intersections throughout the study area.

Transit

Bus service network under the build alternatives would be the same as the No-Build Alternative, which includes the transit service modifications planned in conjunction with FWLE and TDLE. Additional bus service levels or rerouting to the facility are not anticipated for any alternatives.

Development of OMF South would provide Sound Transit with additional capacity to receive, test, commission, store, maintain, and deploy an expanded fleet of LRVs for planned Link service. This capacity would provide for more efficient operation of the existing system and allow Sound Transit to accommodate the planned future expansions of the light rail system to meet the expected ridership demand.

Parking

Under the build alternatives, some existing off-street parking would be removed. Construction of any of the build alternatives and improvements to the surrounding roadways would reduce on-street parking in the study areas as well. However, the loss of on-street parking is anticipated to be minimal.

Up to approximately 480 spaces would be needed for on-site parking for employees, visitors, and nonrevenue vehicles. See Chapter 2 for conceptual layouts, including parking, for each build alternative.

Safety

As with the No-Build Alternative, traffic volumes in the study area are forecast to increase by 2042, which could increase collision frequencies for both motor vehicle and nonmotorized users in the study area. However, the roadway, intersection, and nonmotorized improvements identified under the No-Build Alternative and applicable for the build alternatives would improve safety for motor vehicle and nonmotorized users in the study areas under the build alternatives. OMF South would not result in any adverse safety impacts to intersections, including those with over one crash per million entering vehicles.

With the exception of site driveways, OMF South, including the mainline tracks from the Federal Way Downtown Station to the Preferred and South 344th Street alternatives sites, would not intersect with existing roadways, highways, sidewalks, bicycle lanes, or nonmotorized trails. All tracks would be elevated over these transportation facilities and would not present conflicts for drivers, buses, freight, pedestrians, or cyclists. All vertical support elements would be sited to comply with transportation safety requirements. Site driveways would be designed to meet or exceed all local and state safety standards; thus, no new safety issues are expected to be introduced, and existing safety issues would not be exacerbated.

The mainline tracks would be constructed immediately adjacent to the southbound I-5 clear zone (the area beyond the edge of the traveled roadway) within the I-5 right-of-way. While the mainline track would generally maintain clear zone standards, there may be locations where the minimum widths cannot be met. In such instances, deviations from clear zone distances would require approval from WSDOT or FHWA. Failure to meet the standard width of the clear zone could result in impacts to safety conditions and an increase in collision frequencies. In areas where minimum clear zone conditions cannot be maintained, guardrails, barriers, or impact attenuators, such as water-filled jersey barriers or sand filled barrels, would be provided to shield vehicles from roadside hazards. As a result, the mainline tracks along I-5 are not anticipated to have any quantifiable impact to safety along I-5.

Preferred Alternative

Arterial and Street Operations

The Preferred Alternative would have three access points along S 341st Place. The first would be a visitor/employee entrance with a guard house east of 18th Place S. All employees would enter the site at this location. Access would allow for left-in, left-out, right-in, and right-out at S 341st Place. The second and third access points would be west of 21st Avenue S; however, these entrances would not be used for daily employee access to the site. There would be no turn restrictions at the second or third driveway location.

The Preferred Alternative would close 20th Avenue S from S 336th Street to S 341st Place. A new roadway would be constructed on the west side of the OMF site, extending 18th Place S to S 336th Street. This extension of 18th Place S would add a new three-legged intersection to the south side of S 336th Street. The new S 336th Street/18th Place S Extension intersection would be a two-way stop-controlled (TWSC) intersection with access for left-in, left-out, right-in, and right-out.

In addition, 21st Avenue S would be extended south from S 341st Place to S 344th Street in order to satisfy city code requirements. Development of the Preferred Alternative would not interfere with plans to add a southbound auxiliary lane on 16th Avenue S, as described under the No-Build Alternative.

Tables 3.2-6 and 3.2-7 show AM and PM peak hour LOS and v/c ratios (where applicable) for the Preferred Alternative intersections compared to the No-Build Alternative. Note that Federal Way does not evaluate impacts based on AM peak period operations. Under the Preferred Alternative, no intersections are forecast to operate below the LOS or v/c ratio standards during the AM or PM peak hours. Figure 3.2-7 shows the 2042 AM and PM peak hour operations at intersections within the study area.

Freight

The Preferred Alternative is not anticipated to negatively affect truck circulation or truck routes on the local street network. The mainline tracks would not have any at-grade roadway crossings; therefore, there would not be delays for trucks. Freight would experience the same levels of delay as general-purpose traffic on roadways and at intersections throughout the study area.

Transit

Depending on the mainline alignment, up to 50 parking spaces in the Federal Way/S 320th Street Park & Ride would be removed as part of the Preferred Alternative to accommodate the elevated mainline tracks and a relocated BPA transmission line tower. Given the size of the Federal Way/S 320th Street Park & Ride and its low utilization, sufficient parking would still be available to accommodate demand. WSDOT has indicated that the loss of these stalls would not require replacement.

Nonmotorized Network

Under the Preferred Alternative, nonmotorized volumes would increase as described for the No-Build Alternative. The conceptual layout of the Preferred Alternative would eliminate the existing 20th Avenue S greenway between S 336th Street and S 344th Street; however, it would maintain the existing bicycle network by including bicycle lanes along the extended segment of 18th Place S and extending the eastbound bicycle lanes on S 336th Street from 20th Avenue S to SR 99. It could also impact the future alignment of the planned trails through the Federal Way/S 320th Street Park & Ride but would not necessarily preclude them.

Parking

Development of the mainline for the Preferred Alternative would require the permanent removal of approximately 10 parking stalls from the east side of The Commons at Federal Way shopping mall. There would be an abundance of parking stalls remaining at The Commons at Federal Way. Nearby developments along 18th Place S, S 341st Place, and S 344th Street currently use street parking that would be removed; however, several of these properties would be acquired as part of the project. Impacts associated with acquisitions are discussed in Section 3.3, Acquisitions, Displacements, and Relocations. No adverse impacts to parking are expected.

Impacts to the Federal Way/S 320th Street Park & Ride are described above under Transit.

Table 3.2-6 Preferred Alternative 2042 AM Peak Hour Traffic Operations

ID	Intersection[1]	Control Type	Agency Standard	No-Build Alternative LOS 2, 3	No-Build Alternative Delay (seconds) 2, 3	No-Build Alternative V/C Ratio 2, 3	Preferred Alternative LOS 2, 3	Preferred Alternative Delay (seconds) 2, 3	Preferred Alternative V/C Ratio 2, 3

11	18th Place S Extension/S 336th Street	TWSC	N/A	-	-	-	N/A	N/A	0.01
12	18th Place S/S 340th Street	TWSC	City of Federal Way (v/c 1.0)	-	-	-	N/A	N/A	0.01

Notes:

(1) Intersection 10 (SR99/Driveway), as discussed in the 2021 SEPA Draft EIS and 2023 NEPA Draft/SEPA Supplemental Draft EIS, is no longer included because the site entrance has moved to S 341st Place, east of Intersection 6 (18th Place S/S 341st Place). Intersections 11 and 12 are new intersections formed with the extension of 18th Place S.

(2) Synchro analyzes intersections in isolation and does not take into account downstream congestion. Actual intersection operations may have more delay based on intersection interactions and queuing propagation upstream and downstream between intersections.

(3) Intersections were analyzed using HCM 6th Edition (Transportation Research Board 2016) for signalized and unsignalized intersections, except where HCM 6th Edition limitations necessitated use of HCM 2000 methodology (Transportation Research Board 2000).

11	18th Place S Extension/S 336th Street	TWSC	City of Federal Way (v/c 1.0)	-	-	-	N/A	N/A	0.11
12	18th Place S/S 340th Street	TWSC	City of Federal Way (v/c 1.0)	-	-	-	N/A	N/A	0.01

Notes:

(1) Intersection 10 (SR99/Driveway), as discussed in the 2021 SEPA Draft EIS and 2023 NEPA Draft/SEPA Supplemental Draft EIS, is no longer included because the site entrance has moved to S 341st Place, east of Intersection 6 (18th Place S/S 341st Place). Intersections 11 and 12 are new intersections formed with the extension of 18th Place S.

(2) Synchro analyzes intersections in isolation and does not take into account downstream congestion. Actual intersection operations may have more delay based on intersection interactions and queuing propagation upstream and downstream between intersections.

(3) Intersections were analyzed using HCM 6th Edition (Transportation Research Board 2016) for signalized and unsignalized intersections, except where HCM 6th Edition limitations necessitated use of HCM 2000 methodology (Transportation Research Board 2000).

FIGURE 3.2-7
2042 Build Alternative AM and PM Peak Hour Traffic Operations
Preferred Alternative

OMF South

South 344th Street Alternative

Arterial and Street Operations

The South 344th Street Alternative would have two access points. The first would be a visitor/employee access with a guard house at the intersection of S 344th Street/18th Place S, allowing for access to SR 99 via 16th Avenue S or S 344th Street. All employees would enter the site at this location. A second access would be provided at 20th Avenue S, south of S 336th Street, with direct access to the signalized intersection at S 336th Street; however, it would not be for daily employee access to the site. At the intersection at 18th Place S/S 341st Place, the south and east legs would be removed, as they would be occupied by the OMF site.

This alternative would close 20th Avenue S approximately 300 feet south of S 336th Street and preclude the planned extension of 20th Avenue S from S 341st Place to S 344th Street described under the No-Build Alternative. Drivers would still have access to the Christian Faith Center via 20th Avenue S, and nonmotorized travelers wishing to access the remaining streets in the southern part of the study area would be required to do so via 16th Avenue S or SR 99. The project would not interfere with plans to add a southbound auxiliary lane on 16th Avenue S, as described under the No-Build Alternative.

Tables 3.2-8 and 3.2-9 show AM and PM peak hour LOS and v/c ratios (where applicable) for the South 344th Street Alternative intersections compared to the No-Build Alternative. Note that Federal Way does not evaluate impacts based on AM peak period operations. Under the South 344th Street Alternative, no intersections are forecast to operate below the LOS or v/c ratio standards for the roadway or highway during the AM or PM peak hours. Nearby uses, such as the Christian Faith Center, generate large traffic volumes outside of the weekday AM or PM peak hours. Given the planned arrival and departure times for staff at the facility, traffic generated by OMF South is not anticipated to interfere with events at the Christian Faith Center. Figure 3.2-8 shows the 2042 AM and PM peak hour operations at the intersections within the study area.

Freight

The South 344th Street Alternative is not anticipated to negatively affect truck circulation or truck routes on the local street network. The mainline would not have any at-grade roadway crossings; therefore, there would not be delays for trucks. Freight would experience the same levels of delay as general-purpose traffic on roadways and at intersections throughout the study area.

Transit

Depending on the mainline alignment, up to 50 parking spaces in the Federal Way/S 320th Street Park & Ride would be removed as part of the South 344th Street Alternative to accommodate the elevated mainline and a relocated BPA transmission line tower. Given the size of the Federal Way/S 320th Street Park & Ride and its low utilization, it is estimated that sufficient parking would still be available to accommodate demand if 50 parking spaces were removed.

Table 3.2-8 South 344th Street Alternative 2042 AM Peak Hour Traffic Operations

FIGURE 3.2-8

2042 Build Alternative AM and PM Peak Hour Traffic Operations
South 344th Street Alternative

OMF South

Nonmotorized Network

Under the South 344th Street Alternative, nonmotorized volumes would increase similarly to the No-Build Alternative. As shown in Figure 3.2-5, there are limited existing nonmotorized facilities in the study area. Pedestrian and bicycle facilities would generally be developed in a manner comparable to the No-Build Alternative outside the project footprint. However, this alternative would eliminate the greenway on 20th Avenue S, S 341st Place, 18th Place S, and S 344th Street. Pedestrians and cyclists would continue to be able to travel on the existing sidewalks on SR 99 between S 336th Street and S 344th Street, and Sound Transit would evaluate options for replacing the function of the greenway between S 336th Street and S 344th Street for nonmotorized users. The South 344th Street Alternative could also impact the future alignment of the planned trails through the Federal Way/S 320th Street Park & Ride but would not necessarily preclude them.

Parking

Development of the mainline for the South 344th Street Alternative would require the permanent removal of approximately 10 stalls from the east side of The Commons at Federal Way shopping mall and approximately 20 from the southeast portion of the Walmart property south of S 344th Street. The South 344th Street Alternative would also displace on-street parking adjacent to developments along 21st Avenue S, S 341st Place east of 18th Place S, and S 344th Street east of 18th Place S. There would be an abundance of parking stalls remaining at The Commons at Federal Way and at Walmart. Most developments that may currently use on-street parking along 18th Place S, S 341st Place, and S 344th Street would be acquired as part of the project. Impacts associated with acquisitions are discussed in Section 3.3, Acquisitions, Displacements, and Relocations.

The South 344th Street Alternative may displace up to five on-street parking spaces on the south side of S 344th Street, east of 18th Place S, that may currently be used to access developments that would not be acquired. However, there would be ample space remaining for on-street parking along the south side of S 344th Street, and no adverse parking impacts are expected.

Impacts to the Federal Way/S 320th Street Park & Ride are described above under Transit.

Midway Landfill Alternative

Arterial and Street Operations

Development of the Midway Landfill Alternative would not change the existing roadway network or interfere with the potential for development of planned improvements within the study area as described under the No-Build Alternative. Three access points to the site would be provided: a visitor/employee access with a guard house at SR 99/S 246th Street, a gated employee-only access at SR 99/S 248th Street, and a gated access at S 252nd Street/30th Avenue S. Neither the S 246th Street nor S 248th Street entrance would be signalized.

The project would modify the existing S 246th Street driveway to allow left turns into the site by southbound drivers. Due to the presence of existing medians, left turns out of the site would not be permitted at S 246th Street or S 248th Street. It is assumed that most employees would enter and exit through the SR 99/S 246th Street entrance, while the remaining employees using the parking area closest to the MOW and Link System-Wide Storage facilities would use the southernmost driveway at SR 99/S 248th Street.

Tables 3.2-10 and 3.2-11 show AM and PM peak hour LOS for the Midway Landfill Alternative study area intersections compared to the No-Build Alternative. Note that Kent does not evaluate impacts based on AM peak period operations. One intersection (intersection #5) is forecast to operate below the LOS standards during the AM peak period under the No-Build Alternative. The Midway Landfill Alternative would reduce the delay at this intersection in the AM peak because trips currently using the driveway would no longer do so. Southbound queueing at the SR 99 intersections is not anticipated to extend beyond the current and constructed storage lengths of the left-turn lanes. There are no impacts on LOS from the Midway Landfill Alternative.

Table 3.2-10 Midway Landfill Alternative 2042 AM Peak Hour Traffic Operations

ID	Intersection[5]	Control Type	Agency Standard	No Build Alternative LOS [1, 2, 3, 4]	No Build Alternative Delay (seconds) [1, 2, 3, 4]	Midway Landfill Alternative LOS [1, 2, 3, 4]	Midway Landfill Alternative Delay (seconds) [1, 2, 3, 4]
1	SR 99/S 240th Street	Signal	WSDOT Highways of Statewide Significance (LOS D)	C	23	C	22
5	SR 99/S 248th Street (New Driveway)	TWSC	WSDOT Highways of Statewide Significance (LOS D)	***F***	***53***	***E***	***36***
6	SR 99/S 252nd Street	Signal	WSDOT Highways of Statewide Significance (LOS D)	A	7	A	7
7	SR 99/S 260th Street	Signal	WSDOT Highways of Statewide Significance (LOS D)	D	47	D	47
8	29th Avenue S/ S 252nd Street	TWSC	City of Kent (LOS E)	A	9	A	9
9	29th Avenue S/ S 259th Street	TWSC	City of Kent (LOS E)	C	22	C	22

Notes:

(1) Synchro analyzes intersections in isolation and does not take into account downstream congestion. Actual intersection operations may have more delay based on intersection interactions and queuing propagation upstream and downstream between intersections.

(2) Intersections were analyzed using the Synchro outputs for signalized intersections and Highway Capacity Manual 2010 outputs for unsignalized intersections (Transportation Research Board 2010).

(3) At signalized intersections utilizing HCM 6th Edition methodology (Transportation Research Board 2016), U-turn movements were added to left-turn movements to allow for analysis.

(4) Cells highlighted in ***gray bold and italicized*** identify intersections that operate below the LOS standard for the roadway/highway.

(5) Kent does not require analysis of commercial driveways on the east side of SR 99 unless there is a direct impact on a public right-of-way on the west side of SR 99. Therefore, the analysis of intersections 2 through 4 are not described below but are included in Appendix G1, Transportation Technical Report.

Table 3.2-11 Midway Landfill Alternative 2042 PM Peak Hour Traffic Operations

ID	Intersection[5]	Control Type	Agency Standard	No Build Alternative LOS 1, 2, 3, 4	No Build Alternative Delay (seconds) 1, 2, 3, 4	Midway Landfill Alternative LOS 1, 2, 3, 4	Midway Landfill Alternative Delay (seconds) 1, 2, 3, 4
1	SR 99/S 240th Street	Signal	WSDOT Highways of Statewide Significance (LOS D)	D	37	D	39
5	SR 99/S 248th Street	TWSC	WSDOT Highways of Statewide Significance (LOS D)	***F***	***97***	***F***	***102***
6	SR 99/S 252nd Street	Signal	WSDOT Highways of Statewide Significance (LOS D)	D	36	D	36
7	SR 99/S 260th Street	Signal	WSDOT Highways of Statewide Significance (LOS D)	D	41	D	41
8	29th Avenue S/ S 252nd Street	TWSC	City of Kent (LOS E)	A	9	A	9
9	29th Avenue S/ S 259th Street	TWSC	City of Kent (LOS E)	E	38	E	38

Notes:

(1) Synchro analyzes intersections in isolation and does not take into account downstream congestion. Actual intersection operations may have more delay based on intersection interactions and queuing propagation upstream and downstream between intersections.

(2) Intersections were analyzed using the Synchro outputs for signalized intersections and Highway Capacity Manual 2010 outputs for unsignalized intersections (Transportation Research Board 2010).

(3) At signalized intersections utilizing HCM 6th Edition methodology (Transportation Research Board 2016), U-turn movements were added to left-turn movements to allow for analysis.

(4) Cells highlighted in ***gray bold and italicized*** identify intersections that operate below the LOS standard for the roadway/highway.

(5) Kent does not require analysis of commercial driveways on the east side of SR 99 unless there is a direct impact on a public right-of-way on the west side of SR 99. Therefore, the analysis of intersections 2 through 4 are not described below but are included in Appendix G1, Transportation Technical Report.

During the PM peak hour, the intersection at SR 99/S 248th Street is forecast to operate at LOS F, which is below the standard for SR 99. While this intersection is forecast to operate below standard under the No-Build Alternative, the Midway Landfill Alternative would increase delay by 5 seconds beyond no-build conditions. Since the increased delay is less than 10 seconds, it would not be considered an impact. No other intersections within the Midway Landfill Alternative study area are forecast to operate below the LOS standards.

Figure 3.2-9 shows the 2042 AM and PM peak hour operations at the Midway Landfill Alternative study intersections.

FIGURE 3.2-9

2042 Build Alternative AM and PM Peak Hour Traffic Operations
Midway Landfill Alternative

OMF South

Transit

The existing pair of Metro RapidRide stops at SR 99/S 246th Street would need to be permanently relocated to accommodate development of the Midway Landfill Alternative.

The Midway Landfill Alternative does not include a dedicated test track. Sound Transit would continue testing LRVs on existing mainline tracks during off-peak periods and at night during non-revenue hours when the rail system is closed to passenger service. This would limit the daily time available to test and commission vehicles because those same tracks are used for passenger service and movement of rail vehicles during maintenance and inspection periods. This could result in insufficient vehicle quantities available to meet system expansion requirements under Sound Transit 3. In addition, the lack of a dedicated test track would slow the rehabilitation and replacement of the existing fleet of LRVs. As a result, light rail operations would be less efficient than they would otherwise be, and Sound Transit may not be able to meet expected ridership demand.

Nonmotorized Network

Under the Midway Landfill Alternative, nonmotorized volumes would increase similarly to the No-Build Alternative. As shown in Figure 3.2-6, there are limited existing nonmotorized facilities in the study area, none of which would be eliminated by the project. Pedestrian and bicycle facilities would generally be developed in a manner comparable to the No-Build Alternative. However, facilities that were planned to cross through the site area would not be developed, such as the unfunded north-south improvements that would connect S 244th Street to S 252nd Street through the Midway Landfill Alternative study area. Should future nonmotorized facilities be developed north of the Midway Landfill Alternative, a north-south shared-use path, parallel to I-5, could be developed by others east of OMF South (between I-5 and OMF South) to provide a connection to the area south of the project site.

Parking

The Midway Landfill Alternative would not remove formal on-street parking areas. Depending on the extent of roadway improvements, there could be a loss of intermittent gravel shoulder areas on the north side of S 252nd Street, which may currently be used for parking by local residents. However, this would have a minimal impact as the residences have private driveways, and there are informal parking areas that would remain on the south side of the street.

3.2.2.3 Construction Impacts

Impacts Common to All Build Alternatives

Each build alternative would require some preparatory demolition and earthwork that would generate truck trips in addition to material delivery and general construction vehicle activity throughout the duration of construction. Because most construction-period traffic would occur while hauling material to and from the site during site preparation, the estimated volumes of truck traffic presented for each alternative focus on that period of peak construction traffic to present the worst-case scenario. Similarly, because the construction staging areas, origin of the import material, and destination for export material are unknown at this time, the volumes forecast on each roadway segment represent the highest possible volumes for all daily construction activity. A single potential roadway identified as a haul route could be used for all daily truck trips, or the total daily volumes could be distributed among multiple roadways.

Impacts associated with construction truck activities were calculated by assigning a passenger car equivalent (PCE) for each truck trip, which converts the number of trucks to an estimated number of passenger cars. The Highway Capacity Manual recommends a range of PCE factors for trucks from 1.1 to 2.5 (Transportation Research Board 2010).

For the purposes of this analysis, it was assumed that material would be transported to and from the site in dump trucks with trailers that have a capacity of 20 cubic yards. Given their size and slower operating speeds, these trucks were assigned a PCE value of 2.5, meaning one construction truck is equivalent to two-and-a-half passenger cars. Table 3.2-12 summarizes the peak daily and hourly truck trips and PCE values anticipated for the three build alternatives during site preparation, including the three Midway Landfill Alternative subsurface construction design options. More detail is discussed for each build alternative below.

Table 3.2-12 Estimated Truck Activity and Passenger Car Equivalency Values Associated with Site Preparation for the Build Alternatives

Full Excavation	554	1,385	48	120

Notes:

(1) PCE = passenger car equivalency. Given their size and slower operating speeds, trucks were assigned a PCE value of 2.5, meaning one construction truck is equivalent to two-and-a-half passenger cars.

(2) If neither the Preferred nor the South 344th Street alternative is selected, the mainline could be built later in time if TDLE is constructed as proposed. TDLE is currently under environmental review.

On-street parking on roadways where frontage improvements will be installed would be impacted during construction.

Preferred Alternative

Site preparation work for the OMF is expected to take approximately 1 year and 5 months, assuming 12-hour workdays, 6 days per week. The development scenario for the Preferred Alternative assumes reuse of 80 percent of on-site material. There would be about 45 round trip truck trips during the daily 12-hour construction period (24 export truck trips and 21 import truck trips).

Construction access would be provided at three locations: S 336th Street at 20th Avenue S, SR 99 at the existing driveway to the Christian Faith Center, and S 341st Place at 20th Avenue S. Construction access for mainline track construction from the Federal Way Downtown

Station to the site would occur at S 324th Street, S 330th Street, and S 336th Street. Trucks would access northbound and southbound I-5 at the S 320th Street and S 348th Street interchanges via SR 99. To minimize impacts to traffic circulation during construction and meet Federal Way requirements, Sound Transit would extend 18th Place S or construct a temporary public roadway through the construction site prior to closure of 20th Avenue S.

Table 3.2-13 summarizes average annual daily trips (AADT) on streets that are part of the haul routes as well as the estimated truck trips as a percentage of AADT. The haul routes include state facilities, including SR 99, SR 18 (S 348th Street), and I-5, as well as several collector and arterial streets. The estimated daily truck PCE trips associated with site preparation could represent up to 22.6 percent of existing single direction traffic on collector and arterial roadways and up to 1.9 percent of the existing single direction AADT for all state facilities, with the highest percentages at on- and off-ramps. Figure 3.2-10 displays the location of AADT counts for the Preferred Alternative.

Table 3.2-13 Estimated Hourly Truck Activity at the Preferred and South 344th Street Alternatives Compared with Existing AADT

Intersection/Roadway Segment	Existing AADT (Both Directions)[1]	Existing AADT (Single Direction)[1]	Preferred Alternative Daily Truck Trips as a Percentage of Single Direction AADT	South 344th Street Alternative Daily Truck Trips as a Percentage of Single Direction AADT

Sources: WSDOT Traffic GeoPortal, 2018. City of Federal Way 2010 Estimated Weekday Average Daily Traffic, 2011.

Note:

(1) WSDOT and Federal Way report annual average daily trips (AADT) for roadways. Where roadways are bidirectional, the AADT reported reflects both directions. Single direction volumes were determined by dividing bidirectional volumes in two.

Mainline construction, including the mainline tail tracks, is expected to take 15 months for both mainline alignments (40 mph Alignment and 55 mph Design Option). Construction of the mainline tracks would require temporary full and/or partial closures to streets that travel beneath them. Peak truck trips during mainline track construction are estimated to be up to 10 trucks per hour for concrete delivery, or up to 120 trips per day (300 PCE), assuming 12 hours per day of active construction, some of which may occur at night. A similar level of truck activity is expected for earthwork activities, but this would be focused on trucks hauling material during excavation and would not overlap with concrete delivery trucks. Haul routes for mainline track construction are anticipated to be the same as described above for OMF site construction.

If mainline track and site construction occur concurrently, truck trips on roadways would be expected to increase proportionately as compared with site construction only. Streets with the lowest existing AADT, such as S 336th Street and S 344th Street, would experience the highest relative growth in traffic compared to existing volumes. If driveway closures are required, access to these properties would be maintained to the extent practical. If access to a business could not be maintained during construction, the specific construction activity would be reviewed to determine whether it could occur during non-business hours.

During construction of the Preferred Alternative, transit service on S 324th Street, S 336th Street, and 23rd Avenue S would likely be impacted. Buses may need to be rerouted and bus stops may need to be temporarily relocated in response to construction related road closures. Bus service may also be slower and less reliable in construction areas. Bus service into the Federal Way/S 320th Park & Ride may need to be rerouted to avoid construction areas.

FIGURE 3.2-10

Existing Annual Average Daily Traffic Along Truck Haul Routes
Preferred Alternative

OMF South

Of the 877 parking spaces at the Federal Way/S 320th Street Park & Ride, about 650 spaces would be temporarily closed during mainline construction for both mainline alignments. In the first quarter of 2023, utilization of the Park & Ride was at 1.3 percent. While this facility has not been used at capacity in recent years, utilization could change with the opening of FWLE, which has a forecasted in-service date of 2026.

Because the construction area includes all of the S 336th Street programmed site area, the impacts to pedestrian and bicycle facilities during construction and upon completion of the facility would be similar. The current north-south greenway would be closed, and bicycle lanes would be reopened with construction of the extended 18th Place S roadway. Pedestrian and bicycle facilities on S 324th Street, S 330th Street, S 336th Street, S 340th Street, 341st Place, 18th Place S, 21st Avenue S, and 23rd Avenue S would be impacted during construction of right-of-way improvements in these areas.

Construction of the mainline would require the temporary closure of parking stalls on the east side of The Commons at Federal Way shopping mall.

South 344th Street Alternative

Site preparation work is expected to take approximately 1 year and 6 months, assuming 12-hour workdays, 6 days per week. The development scenario for the South 344th Street Alternative assumes reuse of 80 percent of on-site material. There would be about 77 truck trips during the daily 12-hour construction period (67 export truck trips and 10 import truck trips).

Construction access at the South 344th Street Alternative would be provided at two locations: S 336th Street at 20th Avenue S and via direct access from S 344th Street. Construction access for mainline track construction from the Federal Way Downtown Station to S 344th Street would occur at S 324th Street, S 330th Street, and S 336th Street. Trucks would access northbound and southbound I-5 at the S 320th Street and S 348th Street interchanges via SR 99.

Table 3.2-13 summarizes AADT on streets that are part of the haul routes as well as the estimated truck trips as a percentage of AADT. The haul routes include state facilities, including SR 99, SR 18 (S 348th Street), and I-5, as well as several collector and arterial streets. The estimated daily truck PCE trips associated with site preparation for the South 344th Street Alternative could represent up to 38.6 percent of existing traffic on collector and arterial roadways. Daily truck PCE trips could represent as much as 3.2 percent of the existing single-day AADT for all state facilities, with the highest percentages at on- and off-ramps. Figure 3.2-11 displays the location of AADT counts.

Impacts from construction of the mainline tracks would be the same as described above for the Preferred Alternative.

During construction of the S 344th Street Alternative, transit service on S 324th Street, S 336th Street, and 23rd Avenue S would likely be impacted. Buses may need to be rerouted and bus stops may need to be temporarily relocated in response to construction-related road closures. Bus service may also be slower and less reliable in construction areas. Bus service into the Federal Way/S 320th Park & Ride may need to be rerouted to avoid construction areas. Impacts to the Federal Way/S 320th Street Park & Ride would be the same as described for the Preferred Alternative.

FIGURE 3.2-11

Existing Annual Average Daily Traffic Along Truck Haul Routes
South 344th Street Alternative

OMF South

The impacts to pedestrian and bicycle facilities during construction would be similar, as described under long-term impacts. The 20th Avenue S greenway between S 336th Street and S 344th Street would be closed, as would portions of 18th Place S and S 341st Place, effectively eliminating much of the existing street grid network in the southern part of the study area. Pedestrian facilities on S 324th Street, S 330th Street, S 341st Place, S 344th Street, 18th Place S, and 23rd Avenue S would be impacted during construction of right-of-way improvements in these areas.

Construction of the mainline would require the temporary closure of parking stalls on the east side of The Commons at Federal Way shopping mall and the Walmart property south of S 344th Street.

Midway Landfill Alternative

The three subsurface construction design options for the Midway Landfill Alternative would each have different construction and transportation impacts. In addition to earthwork, the Platform and Hybrid subsurface construction design options would include drilled shaft and concrete slab elements, which would occur concurrently and in coordination with the earthwork process. Depending on the subsurface construction design option, site preparation could take up to approximately 5 years and 7 months, assuming 12-hour workdays, 6 days per week. Estimated round-trip truck trips per day for export and import activities during construction are shown in Table 3.2-14.

Table 3.2-14 Estimated Truck Activity Associated with Site Preparation for Midway Landfill Alternative Subsurface Construction Design Options

Subsurface Construction Design Option	Export Material (tons)	Total Export Truck Trips per Day	Soil Import (cubic yards)	Concrete Import	Total Import Truck Trips per Day	Total Truck Trips per Day	Site Preparation Duration (years, months)
Platform	678,000	20	0	531,000	51	71	4 y, 1 m
Hybrid	2,592,000	280	1,240,000	165,000	284	564	5 y, 7 m
Full Excavation	2,956,500	280	1,610,000	0	274	554	4 y, 4 m

Excavated material from the Midway Landfill would require disposal at a Subtitle D landfill due to the anticipated extent of contaminated material. Within the Pacific Northwest, there are three possible landfill facilities in Washington and Oregon with between approximately 120 and 329 million tons of remaining capacity. Excavated material would first be hauled by truck to a regional transfer facility in the region before traveling to one of the landfills by rail.

Soil and concrete import activity would vary among the subsurface construction design options as well, with as few as 51 import truck trips per day for the Platform subsurface construction design option and up to 284 per day for the Hybrid subsurface construction design option. The estimates of truck traffic are conservative because at this time it is unknown how much excavated material could be reused as fill material elsewhere on the site.

The traffic analysis assumes all excavated material would be transported off site and all fill material would be imported to the site. Table 3.2-15 summarizes forecast daily and hourly truck activity associated with export and import for the Midway Landfill Alternative.

Table 3.2-15 Estimated Hourly Truck Activity Associated with Midway Landfill Alternative Subsurface Construction Design Options

Subsurface Construction Design Option	Hourly Trucks Export	Hourly Trucks Import	Hourly Trucks Total	Hourly PCE	Total Truck Trips per Day	Daily PCE
Platform	2	5	7	18	71	178
Hybrid	24	24	48	120	564	1,410
Full Excavation	24	24	48	120	564	1,410

Construction access to the site would be limited to a single driveway at SR 99 and S 246th Street. Outbound trucks exiting the site to transport excavated materials would travel north on SR 99 and access I-5 via SR 516 (Kent-Des Moines Road) to reach the intermodal terminal. Inbound trucks would travel south on I-5, exiting at S 272nd Street. They would travel westbound on S 272nd Street to SR 99, where they would turn north and travel to the site. Access to the site for outbound and inbound trucks would be via right turns into and out of the site. Trucks importing material would follow the same routes.

Due to their weight, large trucks would require additional time to accelerate to general-purpose traffic speeds on SR 99 when leaving the site and additional time to decelerate when entering the site. The substantial number of truck trips required for the Hybrid and Full Excavation subsurface construction design options would result in a greater potential to increase traffic congestion along SR 99 than the Platform subsurface construction design option or the Preferred or South 344th Street alternatives.

Table 3.2-16 summarizes AADT on streets that comprise the haul routes as well as the estimated truck trips as a percentage of existing single direction AADT. The haul routes include SR 99, SR 516, I-5, and S 272nd Street. Because the location of the intermodal facility and the origin of the import material are unknown at this time, the volumes forecast on the I-5 on- and off-ramps represent the maximum forecast for a given direction and would not be present on all ramps. For example, if the intermodal facility and the origin of the import material are to the north of the Midway Landfill Alternative, there would be no truck activity on the southbound I-5 on-ramp from SR 516 or the S 272nd Street off-ramp from northbound I-5.

The estimated daily PCE truck trips associated with the Platform subsurface construction design option would represent less than the Hybrid and Full Excavation subsurface construction design options, with no more than 2.9 percent of the existing single direction AADT compared to 7.7 to 22.7 percent for the Hybrid and Full Excavation subsurface construction design options. Daily PCE truck trips for all options would range from 0.2 to 1.3 percent on I-5. Figure 3.2-12 displays the location of AADT counts.

During construction of the Midway Landfill Alternative, buses may need to be rerouted off SR 99 and bus stops at S 246th Street and 252nd Street served by the King County Metro A Line may need to be temporarily relocated. Bus service may also be slower and less reliable through construction areas. Because FWLE would be operational by the time construction would begin, there would be some limited disruption of light rail service in order to connect the lead tracks of the OMF.

Table 3.2-16 Estimated Daily Truck Activity for the Midway Landfill Alternative Compared with Existing AADT

Intersection/Roadway Segment	AADT (Both Directions)[1]	AADT (Single Direction)[1]	Daily Truck Trips as a Percentage of Single Direction AADT Platform Option	Daily Truck Trips as a Percentage of Single Direction AADT Hybrid Option	Daily Truck Trips as a Percentage of Single Direction AADT Full Excavation Option

Existing Annual Average Daily Traffic Along Truck Haul Routes
Midway Landfill Alternative

OMF South

3.2.2.4 Avoidance and Minimization of Impacts

For all build alternatives, a construction transportation management plan addressing site access, traffic control, hauling routes, impacts to transit, construction employee parking, impacts to local businesses, and pedestrian and bicycle control in the area would be prepared per city of Kent or city of Federal Way requirements and in coordination with WSDOT, as applicable. If driveway closures are required, access to these properties would be maintained to the extent practical. If access to a business could not be maintained during construction, the specific construction activity would be reviewed to determine whether it could occur during non-business hours or whether the parking and users of this access could be accommodated at an alternative location.

Other avoidance and minimization measures that would be determined during the final design and permitting process could include:

- Install advance warning signs and highly visible construction barriers and use flaggers where needed.
- Clearly sign and provide reasonable detour routes when cross streets are closed.
- Use lighted or reflective signage to direct drivers to truck-haul routes to ensure visibility during nighttime work hours. Use special lighting for work zones and travel lanes, where required.
- Use tools such as print, radio, posted signs, websites, and email to communicate information regarding street closures, hours of construction, business access, and parking impacts.
- Coordinate with transit providers to post advance notice signs prior to construction when bus stops need to be temporarily relocated or closed.
- Post advance notice signs prior to construction in areas where construction activities would affect access to surrounding businesses.
- Schedule traffic lane closures and high volumes of construction truck traffic during off-peak hours to minimize delays, where practical.
- Cover potholes and open trenches, where possible, and use barriers to protect drivers from open trenches.

Any properties temporarily impacted during construction would be restored as closely as possible to their previous condition.

For the Preferred or South 344th Street alternatives, in locations where the mainline tracks do not meet clear zone standards and the tracks cannot be relocated, Sound Transit would work with WSDOT and FHWA to meet roadway standards by taking certain measures, such as regrading to reestablish a clear zone or installing guardrails, barriers, or impact attenuators. These measures would not adversely affect transportation safety in the study area.

3.2.2.5 Indirect Impacts

Indirect impacts are reasonably foreseeable impacts that could occur as a result of an action at some future time and in areas beyond the action’s direct impacts. As an example, indirect impacts often relate to additional changes in land use that could occur beyond those changes immediately caused by a development’s construction and operation, which could result in a change to overall traffic patterns. The OMF South build alternatives are not expected to induce future land use changes beyond their respective sites, which could otherwise result in indirect impacts to transportation.

Development of OMF South would provide Sound Transit with capacity to receive, test, commission, store, maintain, and deploy the fleet of light rail vehicles to support the Sound Transit 3 expanded light rail system. This capacity would provide for more efficient operation of the existing system and allow Sound Transit to accommodate the planned future expansions of the light rail system to meet the expected ridership demand. Expansion of the light rail system would have positive indirect impacts to transportation by providing an alternative to privately owned vehicles, which could reduce the amount of vehicle miles travelled (Sound Transit 2016).

3.2.3 Mitigation Measures

3.2.3.1 Long-Term Measures

OMF South is not anticipated to result in long-term operational impacts to freight, transit, nonmotorized transportation, parking, or safety. Therefore, no mitigation is proposed for those transportation elements. Construction impact mitigation measures are discussed below.

Depending on the subsurface construction design option, construction of the Midway Landfill Alternative could require ingress and egress by a substantially greater number of large trucks than for the Preferred or South 344th Street alternatives. To avoid potential traffic impacts on SR 99 from the number of additional trucks, short acceleration and deceleration lanes could be added to the construction entrance to the landfill site to allow outbound trucks to get up to speed and allow inbound trucks to slow down outside of the general-purpose lanes. Additional strategies to reduce impacts to local traffic during construction could include limiting truck activity during the peak traffic hours, which could extend the construction duration, or providing a direct connection to the I-5 corridor from the construction site. Such a connection would require approval by WSDOT and FHWA. If the Midway Landfill Alternative is selected, these mitigation measures would be confirmed during final design and permitting in coordination with Federal Way, WSDOT, and, if needed, FHWA.

Prior to closing a portion of the Federal Way/S 320th Street Park & Ride for construction, Sound Transit would work with King County Metro and WSDOT to determine its utilization rates and that of the nearby Federal Way Downtown Station. If the lots are at or near capacity, Sound Transit would implement alternative measures, such as routing transit riders that use these locations to available spaces at nearby park-and-ride lots, such as the Star Lake Park & Ride, or leasing parking lots or new parking areas within the vicinity of the temporarily closed lot.

3.3 Acquisitions, Displacements, and Relocations

This section discusses the potential impacts of acquisitions, displacements, and relocations associated with the OMF South project alternatives. The study area includes parcels that are anticipated to be permanently acquired for OMF South based on its current level of design. The study area for the relocation analysis includes Federal Way and Kent.

The acquisitions analysis considers two types of potentially affected parcels — partial and full acquisitions:

- **Partial acquisition** – A portion of a parcel would be acquired, but the current use and occupants would usually not be displaced. In some instances, such as with larger parcels that hold multiple uses, a business or residence on a parcel could be displaced while other uses and occupants might remain.
- **Full acquisition** – The entire parcel would be acquired, and all current occupants would be displaced. In some instances, full acquisitions include parcels that may not be entirely needed for the project but would be affected to the extent that current occupants would be substantially impacted.

For the purposes of this analysis, full and partial acquisitions are analyzed together as "potentially affected parcels." Potentially affected parcels in the study area and their existing land uses are identified in the sections below and are shown in figures located in Appendix H1, Potentially Affected Parcels. These impacts are an estimate based on conceptual designs (Appendix C, Conceptual Design Drawings and Engineering Information) to provide for a comparison of alternatives. The number and type of displacements may vary between what is included in the Final EIS and what is ultimately required during the design-build process. Final determinations of the property needs for the project, including acquisitions and displacements, will be based on the project's final design after Sound Transit completes the EIS process and selects the alternative to be built.

The acquisition and displacement data presented in this section are estimates based on 2022 King County assessor's data. Occupant types described in this report are based on available information at the time of this analysis and could change as the project is developed and constructed.

In addition to the permanently affected parcels, the project would require temporary construction easements (TCEs), permanent easements, and the permanent use of right-of-way owned by WSDOT and local jurisdictions. Permanent guideway and maintenance easements are included as potentially affected parcels in tables below and figures located in Appendix H1, Potentially Affected Parcels, but TCEs are not included in the analysis.

3.3.1 Affected Environment

3.3.1.1 Preferred Alternative

The Preferred Alternative site includes parcels with existing commercial, institutional, and vacant land uses. Several parcels within this alternative are owned by the Christian Faith Center and include a large church facility, a school and daycare center, parking lots, vacant fields designated as a future development site for athletic fields, and an academic center. The Preferred Alternative mainline, test, and tail tracks include WSDOT right-of-way and single- and multi-family residential, commercial, and institutional land uses.

3.3.1.2 South 344th Street Alternative

The South 344th Street Alternative site partially overlaps with the Preferred Alternative, which is directly to the north and includes many of the same land uses. The South 344th Street Alternative differs from the Preferred Alternative south of S 341st Place, where it includes additional residential, commercial, and institutional land uses. The South 344th Street Alternative mainline, test, and tail tracks include WSDOT right-of-way and single- and multi-family residential, commercial, and institutional land uses.

3.3.1.3 Midway Landfill Alternative

The Midway Landfill Alternative is along the western edge of the Midway Subarea Plan. This alternative includes existing landfill, commercial, and industrial uses.

3.3.2 Environmental Impacts

Sound Transit would acquire public and private property for the construction and operation of OMF South and its associated tracks, including the mainline, test, lead, and tail tracks. Acquisition estimates are based on the conceptual plans Sound Transit developed for the build alternatives. The level of acquisitions discussed in this section provides information useful for comparing alternatives. Estimates of displaced properties reflect the conditions at the time the analysis was conducted. Because property uses change over time, the number and/or type of displacements could vary between what is disclosed in this Final EIS and what would finally be required.

3.3.2.1 No-Build Alternative

Under the No-Build Alternative, impacts from construction and operation of the OMF South would not occur. However, other planned projects would have impacts in the OMF South study areas. This includes TDLE, which overlaps with the OMF South Preferred and South 344th Street alternatives. If TDLE is constructed as proposed, the mainline track associated with these OMF alternatives would be built later in time. Impacts associated with construction of the mainline track are addressed within the build alternatives impacts discussion below. All other TDLE-related impacts are addressed in Chapter 4, Cumulative Effects Analysis.

3.3.2.2 Long-Term Impacts

Impacts Common to All Build Alternatives

To determine potential acquisitions and displacements for each build alternative, Sound Transit laid its proposed OMF South footprints over King County parcel data and high-resolution aerial imagery. The acquisitions analysis produced results for each build alternative separated by mainline track impacts and OMF site impacts. For the Preferred and South 344th Street alternatives, the mainline tracks include the test and tail tracks. For all build alternatives, the OMF site includes lead tracks connecting to the mainline tracks.

Table 3.3-1 below summarizes the number of potentially affected parcels and displacements by alternative.

Table 3.3-1 Potentially Affected Parcels and Displacements

Alternative	Affected Parcels	Displaced Businesses	Displaced Residences[1]	Displaced Religious Facilities	Other Displacements[2]
Preferred Alternative with 40 mph Alignment[3]	37	11	86	1	0
Preferred Alternative with 55 mph Design Option[3]	37	11	92	1	0
South 344th Street Alternative with 40 mph Alignment[3,4]	60	17	91	4	67
South 344th Street Alternative with 55 mph Design Option[3,4]	60	17	97	4	67
Midway Landfill Alternative	47	4	0	0	0

Notes:

(1) Residential displacements include individual apartment/condo units and mobile homes. For Belmor, displacements are based on the current configuration of mobile home pads, including both vacant and occupied pads.

(2) Includes individual GarageTown units. GarageTown is also counted as one business displacement under “Displaced Businesses.”

(3) If neither the Preferred nor the South 344th Street alternative is selected, the mainline could be built later in time if TDLE is constructed as proposed. TDLE is currently under environmental review.

(4) The number of affected parcels and displacements would be the same for the Enchanted Parkway and I-5 mainline tail track options.

Table 3.3-2 presents the potentially affected parcels by land use for each build alternative and impact type (e.g., mainline tracks, OMF site). For all the build alternatives, most of the affected parcels would be associated with the OMF site.

Table 3.3-2 Affected Parcels by Land Use

Alternative	Single Family Residential	Multi Family Residential[1]	Commercial/ Industrial	Public/ Institutional[2]	Vacant	Total
Preferred Alternative						
Mainline[3,4]	0	1	2	1	3	7
OMF Site	10	1	12	3	4	30
Total	**10**	**2**	**14**	**4**	**7**	**37**
South 344th Street Alternative						
Mainline[3,4,5]	0	1	3	1	4	9
OMF Site	21	0	22	4	4	51
Total	**21**	**1**	**25**	**5**	**8**	**60**
Midway Landfill Alternative						
OMF Site	14	0	11	13	9	47

Source: King County Assessor (2022)

Notes:

(1) Belmor is categorized as one “Multi-Family Residential” parcel but contains over 300 individual mobile home units (reflected in residential displacements).

(2) “Public/Institutional” land uses include religious facilities, park-and-rides, and utility properties.

(3) The number of affected parcels would be the same for the mainline 40 mph Alignment or 55 mph Design Option, but the 55 mph Design Option would displace a greater number of units within Belmor, as discussed below.

(4) If neither the Preferred nor the South 344th Street alternative is selected, the mainline could be built later in time if TDLE is constructed as proposed. TDLE is currently under environmental review.

(5) The number of affected parcels would be the same for the Enchanted Parkway or I-5 mainline tail track options.

The following sections detail property impacts to existing land uses for each of the build alternatives. Appendix H1, Potentially Affected Parcels, includes figures and tables with parcel reference information.

Preferred Alternative

The mainline tracks would be primarily in the WSDOT I-5 right-of-way, except at the northern end where the proposed alignment transitions from the Downtown Federal Way Station to the WSDOT right-of-way. In this area, the Preferred Alternative would impact Belmor, a 63-acre mobile home park for adults 55 years and older that contains over 300 mobile home units and a nine-hole golf course. The 40 mph Alignment would displace slightly fewer units at Belmor than the 55 mph Design Option. Other parcels that would be affected by the mainline tracks include part of The Commons at Federal Way shopping center, the Federal Way/S 320th Street Park & Ride, as well as several vacant parcels.

Of the build alternatives, the Preferred Alternative OMF site would affect the fewest parcels. Additionally, it would have fewer business and residential displacements than the South 344th Street Alternative, but more than the Midway Landfill Alternative. Most of the affected parcels are single-family residential or commercial/industrial existing uses. The OMF site would displace one multi-family and 10 single-family residences. Most of these residences are adjacent to the I-5 right-of-way between S 333rd Street and S 336th Street, where the lead tracks would connect to the mainline tracks. As noted in Table 3.3-1, the OMF site would also displace 11 businesses and one religious facility, the Christian Faith Center.

Additionally, this alternative would require conversion of one WSDOT Resource Conservation Area (RCA; originally acquired under the Highway Beautification Act of 1965) to a transportation use within the I-5 right-of-way. Impacts are discussed in more detail in Section 3.7, Visual and Aesthetic Resources.

South 344th Street Alternative

The South 344th Street Alternative would have the most affected parcels, business displacements, and residential displacements of the OMF site build alternatives. The property impacts associated with the South 344th Street Alternative mainline north of the OMF site are the same as described for the Preferred Alternative. The mainline alignments would affect the same number of parcels, but the 55 mph Design Option would have more displacements than the 40 mph Alignment. The South 344th Street Alternative mainline tail tracks would affect two additional parcels south of the OMF South site. Both mainline tail track options, the Enchanted Parkway alignment and the I-5 alignment, would have the same number of affected parcels and displacements.

The South 344th Street Alternative OMF site would impact primarily single-family residential and commercial/industrial parcels. The OMF site would displace residences along S 340th Street and 18th Place S. It would also displace 17 businesses, including Ellenos Yogurt and GarageTown, which includes 67 individual units. Additional displacements include the Trinity Broadcasting tower and four religious facilities: Voice of Hope Church, Family Life Community Church, Redwood Church of God, and Tabernacle Temple of Praise. Unlike the Preferred Alternative, the South 344th Street Alternative would not displace the daycare center or Christian Faith Center church and school.

This alternative would also require conversion of two WSDOT RCAs to a transportation use within the I-5 right-of-way. Impacts are discussed in more detail in Section 3.7, Visual and Aesthetic Resources.

Midway Landfill Alternative

For the Midway Landfill Alternative, all affected parcels and displacements are associated with the OMF site because it would use the FWLE mainline tracks currently under construction. The Midway Landfill Alternative would have the fewest business displacements (4) and no residential displacements. The businesses include an insurance business, an optometry clinic, and two warehouse businesses. A majority of the affected public/institutional parcels are associated with the Midway Landfill, which is owned by the city of Seattle and managed by SPU.

3.3.2.3 Construction Impacts

During construction, additional properties would be needed for roadway improvements, culvert replacements, staging areas, construction access, and other temporary construction activities. Most construction activities would be accommodated within areas of permanent acquisition, although some activities would require TCEs on adjacent properties surrounding each alternative. A TCE allows for temporary use of a property during construction. When construction is complete, the property is restored as closely as possible to its previous condition or better, and the easement is terminated. These parcels are not included in the tables above or Appendix H1, Potentially Affected Parcels, because they would not permanently displace existing uses, and they are not anticipated to substantially disrupt existing uses. Additionally, the location and extent of TCEs are subject to change as the design for OMF South progresses.

3.3.2.4 Avoidance and Minimization of Impacts

The build alternatives identified for study in the EIS were carried forward, in part, to avoid or minimize impacts to residents and businesses. During design, the OMF South sites were configured to meet programming requirements while minimizing, to the extent feasible, acquisitions, displacements, and relocations. Where available, the mainline tracks would be located near or within public rights-of-way to reduce the number of private property impacts.

Any properties temporarily impacted during construction would be restored as closely as possible to their previous condition.

3.3.2.5 Indirect Impacts

The project could contribute to indirect impacts where existing land uses on acquired properties are converted to transportation uses following construction, thereby potentially impacting the future land uses of adjacent properties. These potential indirect impacts are discussed in Section 3.4, Land Use.

3.3.3 Relocation Opportunities

To determine the relocation opportunities in the project vicinity, Sound Transit researched market conditions for available residential and commercial real estate in Federal Way and Kent. Available property information is summarized in Tables 3.3-3 and 3.3-4. Although property uses may change before construction of OMF South, research indicates that there would be opportunities for displaced businesses, residents, and other property owners to relocate within the same general area. Some properties with unique characteristics, such as religious and industrial facilities, could be more challenging to relocate.

Table 3.3-3 Property Available for Relocation in the Study Area

Type of Property	Total Buildings/ Units	Total Square Feet[1]	Vacancy Rate[1]	Buildings Listed for Sale[2]	Estimated Units Available[3]
Office	441	7,015,982	10.13%	7	38
Industrial	816	50,588,093	4.74%	7	38
Retail	948	12,183,475	2.20%	8	23
Religious Facility	21	-	-	0	0

Source: CoStar (December 2022)

Notes: The study area or market is defined as the city limits of Federal Way and Kent.

(1) CoStar does not collect data for area of available properties (“Total Square Feet”) for religious facilities. Similarly, vacancy data is calculated using rentable building area which is not applicable to religious facilities.

(2) Includes properties listed as "for sale" in CoStar for apartment, office, industrial, and retail properties in Federal Way and Kent and religious facilities in Federal Way.

(3) Estimates the number of units available for rent on the market using the vacancy rate and total number of units.

Table 3.3-4 Residential Property Available for Relocation in the Study Area

Type of Property	Occupied Units	Available Units	Vacancy Rate
Owner-Occupied	44,931	428	0.94%
Renter-Occupied	35,087	1,564	4.27%

Source: 2017-2021 ACS 5-year Estimates (U.S. Census Bureau 2022)

Note: The study area or market is defined as the city limits of Federal Way and Kent.

3.3.3.1 Commercial and Industrial

Adequate commercial and industrial spaces are available in the market to relocate building owners and tenants displaced as part of the project. Industrial users requiring specific lot sizes and utilities may be more difficult to relocate, including properties such as GarageTown and Ellenos Yogurt that have specific needs, like storage facilities or specialized machinery.

3.3.3.2 Residential

There is a sufficient supply of comparable homes available to accommodate the residents displaced by the project. While comparable homes are available in the general area, displaced residents may have to choose a location in a different neighborhood. For all relocations, Sound Transit would work with those affected to try to keep them in the same general area. This includes identifying replacement housing that considers such factors as proximity to commercial and community facilities, schools (if applicable), an individual’s place of employment, and accessibility to transit if the residents are transit dependent. Although property uses may change before construction of OMF South, research indicates that there would be available locations for displaced residents to be relocated within the same general area.

There are several different types of relocation options potentially available for displaced Belmor residents:

- Relocate within Belmor.
- Relocate to another 55-plus park, renting or purchasing a mobile home within that park, or potentially moving their current mobile home.
- Relocate to a family park, renting or purchasing a mobile home within that park, or moving their existing mobile home.

- Rent or purchase a vacant lot and relocate the existing mobile home to the site.
- Relocate to a purchased or rented single-family residence, condominium, or apartment.
- Consider other options, such as senior living or retirement community housing.

Relocation of mobile home residents could be challenging because there is little availability in mobile home communities within Pierce and King counties.

3.3.3.3 Religious Facilities

Generally, there is adequate space available in the study area to relocate religious facilities that would be displaced by the OMF South build alternatives. Most of the religious facilities that would be displaced are currently located in commercial or industrial buildings and could be relocated to comparable properties. The exception is the Christian Faith Center, which is a large-capacity church on S 336th Street between SR 99 and I-5. There are four parcels associated with the Christian Faith Center, which total approximately 25 acres, including over 200,000 square feet of building space and numerous parking lots. This church would be uniquely difficult to relocate because of its size.

3.3.4 Sound Transit Acquisition and Relocation Policy Summary

Sound Transit would compensate affected property owners according to the provisions specified in Sound Transit’s Real Property Acquisitions and Relocation Policy, Procedures, and Guidelines (Sound Transit 2017); the federal Uniform Relocation Assistance and Real Property Acquisition Policies Act of 1970 (the “Uniform Act”); and the State of Washington’s relocation and property acquisition laws and regulations, including Revised Code of Washington (RCW) 8.26 and Washington Administrative Code (WAC) 468-100. Compensation and entitlements would vary by property, depending on the project effects, the economy, number of available relocation opportunities, and factors outlined in the policies, laws, and regulations. Relocation resources would be available to all qualified individuals in compliance with Sound Transit’s Language Assistance Plan (Sound Transit 2022).

As a public agency, Sound Transit must pay “just compensation” to property owners for land and improvements acquired for public purposes. Determination of just compensation is based on an independent appraisal and appraisal review and must not be less than the fair market value of the property acquired. This value includes any measurable loss in value to the remaining property as a result of a partial acquisition. For TCEs, the affected property owner would be compensated for the temporary use of the property, and the property would be restored as close as possible to its previous condition.

Sound Transit would pay normal expenses of sale, including escrow fees, title insurance, prepayment penalties, mortgage release fees, recording fees, and typical costs incurred as part of conveying title. In addition to compensating owners for property rights, occupants of properties are eligible for relocation benefits. Forms of compensation for displaced persons may include moving expenses, replacement housing payments, nonresidential reestablishment, and other eligible expenses. Sound Transit also provides advisory services that consider the unique needs of those being displaced in order to minimize the inconvenience and hardship of displacement. Sound Transit’s property acquisition and relocation handbooks for residential and nonresidential properties detail the agency’s compensation and acquisition procedures and are described in more detail in Appendix E, Environmental Justice (Sound Transit 2014a, 2014b).

Sound Transit has notified property owners whose property would be directly affected by any of the alternatives. In most cases property acquisitions would begin after the Sound Transit Board selects the project to be built and FTA issues a ROD. However, in select cases property acquisitions may advance sooner, in which case an independent NEPA evaluation and decision would occur.

With FTA's approval, Sound Transit is acquiring the four parcels associated with the Christian Faith Center as a hardship acquisition and a portion of the parcel associated with Belmor as a protective acquisition prior to the OMF South ROD. The purpose of a hardship acquisition is to alleviate a particular hardship to the owner when the property owner can document on the basis of health, safety, or financial reasons that remaining in the property poses an undue hardship compared to others. The purpose of a protective acquisition is to prevent imminent development of a parcel that may be needed for a proposed transportation corridor or site.

Hardship and protective acquisitions do not limit the evaluation of alternatives required under the NEPA process. No development on these parcels would occur until after FTA issues a ROD, and only if the Sound Transit Board selects to build the Preferred or South 344th Street alternatives. The hardship acquisition would allow Christian Faith Center to begin early coordination on potential future sites. No Belmor residents would be displaced until the OMF South environmental review process is complete.

Sound Transit staff will be available to answer questions and provide additional information regarding just compensation, advisory services, and relocation payments and expenses, as well as the timing of the processes. Sound Transit would also provide information on the current availability, purchase price, or rental rates of comparable replacement properties. Sound Transit uses interpreters to help those with limited English proficiency understand their choices and options.

Affected residents and businesses owners would make the final decision on their relocation sites. Generally, owners would not have to relocate until they have been paid the agreed-upon purchase price or an amount equal to Sound Transit's estimate of just compensation has been deposited with the court. Displaced persons would not be required to move or relocate without receiving at least 90 days' notice via written communication.

3.3.5 Mitigation Measures

Sound Transit's policies and procedures comply with federal, state, and local property acquisition and relocation policies and, in some cases, provide advisory services above the minimum requirements of federal and state law. No additional mitigation is anticipated.

For the Preferred and South 344th Street alternatives, Sound Transit would mitigate the conversion of RCAs by providing replacement property, as described in Section 3.7, Visual and Aesthetic Resources.

3.4 Land Use

This section assesses the land use impacts of the proposed OMF South project alternatives by discussing the surrounding zoning compatibility, consistency with regional and local jurisdictional plans and policies, and conversions of land use to a public transportation use that would occur from property acquisition for the proposed project.

The study area includes the properties and local jurisdictions within 0.5 mile of the potential construction limits of each OMF South alternative. This includes portions of Federal Way and unincorporated King County for the Preferred and South 344th Street alternatives and portions of Kent, Des Moines, and unincorporated King County for the Midway Landfill Alternative. The portions of unincorporated King County within the study area have been identified by Federal Way and Kent as part of the cities' Potential Annexation Areas. The most common land uses in the vicinity of the alternatives include commercial, institutional, and single- and multi-family residential.

The methods, resources, and regulations guiding this analysis are described in Appendix H2, Land Use Technical Appendix, along with a complete list of all the zones within the study area by jurisdiction.

3.4.1 Affected Environment

3.4.1.1 Preferred Alternative

Existing Land Uses

Existing land uses within the Preferred Alternative study area include vacant land, public/institutional, and single- and multi-family residential land uses. The public/institutional land uses primarily include parcels associated with the Christian Faith Center and the Pacific Christian Academy.

The mainline tracks parallel I-5 from a large retail store that is just south of S 320th Street to just north of S 344th Street. The existing land uses underlying and abutting the mainline tracks and mainline tail tracks include mostly multi-family residential land uses to the west, vacant land to the south, and commercial land uses to the north, southwest, and southeast. Underlying multi-family residential uses are mostly associated with Belmor, a 63-acre mobile home park for adults 55 and older that contains over 300 mobile homes and a nine-hole golf course that extends west from the mainline tracks.

Land uses that are adjacent to or abut the OMF site boundaries (excluding the mainline tracks) consist primarily of commercial land use and vacant land mostly located to the south and west of the alternative boundaries, with some to the north and northwest. Single- and multi-family residential existing uses are located primarily across S 336th Street. Prominent uses within the study area include churches, cafes, restaurants, a park, school facilities, and single- and multi-family residential buildings to the north; a church, an automobile repair shop, and a bank to the west; and I-5 to the east, with the Pacific Bonsai Museum and the Woodbridge Corporate Park (the former Weyerhaeuser campus) beyond. Located to the south are additional churches; another automobile repair shop; a mini-storage facility, GarageTown, which offers custom storage condominiums; and Ellenos, a yogurt manufacturing facility.

Figure 3.4-1 shows existing land use patterns within the Preferred Alternative study area, which consists primarily of commercial uses (nearly 47 percent of the area), and, to a lesser extent, vacant land (20 percent) scattered throughout the entire area, barring most of the land between the borders of S 324th Street, S 336th Street, SR 99, and I-5, where the public/institutional and residential land uses are primarily clustered. The public/institutional uses are mostly associated with religious facilities, and multi-family residential uses are mostly associated with Belmor.

Zoning

Figure 3.4-2 shows the general zoning patterns designated by Federal Way and King County within the Preferred Alternative study area. Commercial and office are the predominate zones, followed by multi-family residential and mixed-use zones in the northern section of the study area. In total, approximately 59 percent of the study area (excluding the project footprint) is commercial or office, 14 percent is multi-family residential, 17 percent is mixed-use, and 9 percent is single-family residential.

The Preferred Alternative is in the following Federal Way zones: City Center Core (CC-C), Community Business (BC), Commercial Enterprise (CE), and Multi-Family Residential (RM-2400 and RM-3600). The OMF site is primarily in the RM-3600 Multi-Family Residential zone, with the southeastern yard area mostly in the Commercial Enterprise zone and the gate/guard house area in the Community Business zone. The mainline tracks are in the City Center Core, Commercial Enterprise, and RM-3600 Multi-Family Residential zones.

The intent of the City Center Core zone is to create a higher density, mixed-use designation where office, retail, government, and residential uses are concentrated. The Community Business zone is designed to allow a broad mix of uses, encouraging mid-rise, high-quality developments containing a vibrant and compatible mix of well-integrated and designed pedestrian- and auto-oriented uses. The purpose of the Commercial Enterprise zone is to capture the demand for a diverse mix of industrial, office, and retail sales and services, arrayed in well-integrated, high-quality developments. Both multi-family residential zones are intended to provide opportunities for a range of housing types to accommodate anticipated residential growth. For additional details on the purpose of each zone for the Preferred Alternative, see Table H2-2 of Appendix H2, Land Use Technical Appendix.

Preferred Alternative

OMF South

3.4.1.2 South 344th Street Alternative

Existing Land Uses

The South 344th Street Alternative is in much of the same area as the Preferred Alternative. Existing land uses include vacant land and commercial, single-family residential, and public/institutional land uses. This alternative slightly differs from the Preferred Alternative in that existing uses include three smaller church properties and more commercial uses, such as the GarageTown and Ellenos Yogurt properties.

The South 344th Street Alternative would connect to the same mainline tracks as the Preferred Alternative, and the existing land uses underlying and adjacent to the mainline tracks are the same as those described above for the Preferred Alternative. However, the mainline tail tracks would extend farther south for the South 344th Street Alternative. The I-5 alignment would continue south in WSDOT right-of-way, while the Enchanted Parkway alignment would intersect with commercial land uses between S 344th Street and S 348th Street.

Land uses that are adjacent to or abut the OMF site boundaries (excluding the mainline tracks) consist mostly of commercial land uses surrounding the south and west of the alternative boundaries, with smaller areas of public/institutional existing uses to the west and single- and multi-family residential to the north of the site boundaries, across S 336th Street. Prominent uses within the study area include churches, cafes, restaurants, a park, school facilities, and single- and multi-family residential buildings to the north; a church, an automobile repair shop, a bank, and the Federal Way Public Academy to the west; and I-5 to the east, with the Pacific Bonsai Museum and the Woodbridge Corporate Park (the former Weyerhaeuser campus) beyond. The I-5/SR 18 interchange is south of the site, along with additional churches, department stores, an automobile repair shop, and a mini-storage facility.

Figure 3.4-3 shows existing land use patterns within the South 344th Street Alternative study area. Existing land uses are nearly the same as those in the Preferred Alternative study area, with the addition of more commercial land uses existing south of S 352nd Street.

Zoning

Figure 3.4-4 shows the general zoning patterns in the South 344th Street Alternative study area. Like the Preferred Alternative, commercial and office zones are the largest, followed by mixed-use zones to the north and multi-family residential zones situated in the central and west sections of the 0.5-mile study area. In total, approximately 59 percent of the study area (excluding the project footprint) is commercial or office, 14 percent is multi-family residential, 17 percent is mixed-use, and 9 percent is single-family residential.

The South 344th Street Alternative is within the following Federal Way zones: Commercial Enterprise, City Center Core, and RM-3600 and RM-2400 Multi-Family Residential zones. The OMF site spreads across Commercial Enterprise and RM-3600 zones. The northeastern yard area is primarily within the RM 3600 zone, and the southern yard areas and gate/guard house areas are within the Commercial Enterprise zone.

The mainline tracks, including both tail track options, are primarily within the City Center Core, Commercial Enterprise, and RM-3600 Multi-Family Residential zones (very small portions of less than 0.5-acre are within the RM-2400 Multi-Family Residential zone). The purpose of each of these zones are described in the Zoning subsection for the Preferred Alternative, above, and in Table H2-2 of Appendix H2, Land Use Technical Appendix.

3.4.1.3 Midway Landfill Alternative

Existing Land Uses

The Midway Landfill is a former gravel quarry and municipal solid waste landfill that accepted demolition materials, wood, and industrial wastes from approximately 1966 to 1983. The landfill is designated as an EPA Superfund site and is currently capped; an EPA Superfund Record of Decision (EPA 2000) as well as a Midway Landfill Consent Decree (King County Superior Court 1990) have allowed for ongoing operation and maintenance of a landfill gas extraction system and groundwater monitoring. The site includes public/institutional land uses, such as landfill facilities; commercial land uses, such as retail stores and auto repair shops; and vacant land.

Land uses that are adjacent to or abut the Midway Landfill Alternative site boundaries consist of vacant land (located to the north and west), residential (located north and south across S 252nd Street), and commercial (located to the west). OMF South would abut FWLE and the I-5 corridor to the east. Prominent uses within the study area include an elementary school to the west, military facilities and an elementary school beyond I-5 to the east, and automobile retail shops and a shopping center anchored by a large grocery store to the south. To the north of the site are a mobile home park (abutting the site), a community health center, and a college.

Zoning

Figure 3.4-6 shows the general zoning patterns in the Midway Landfill Alternative study area, designated by Kent, Des Moines, and King County. The zones within the Midway Landfill Alternative study area include primarily commercial, mixed uses, and multi-family residential in the central areas near SR 99 and I-5 and single-family residential zones beyond. In total, approximately 57 percent of the 0.5-mile study area (excluding the project footprint) is single-family residential, 17 percent is commercial/office, 10 percent is mixed-use, and 7 percent is multi-family residential.

The Midway Landfill Alternative OMF site is primarily within Kent's Commercial Manufacturing (CM) zone that runs north and south along SR 99 between S 260th Street and S 244th Street. The purpose of the Commercial Manufacturing zone is to provide locations for developments that combine characteristics of retail establishments, small-scale light industrial operations, heavy commercial and wholesale uses, and specialty manufacturing.

The lead tracks of the Midway Landfill Alternative are located in a small portion of the Midway Commercial Residential (MCR) zone. The purpose of this zone is to encourage the location of dense and varied retail, office, or residential activities in support of light rail and mass transit options; enhance a pedestrian-oriented character; and implement the goals and policies of the Midway Subarea Plan.

For additional details on the purpose of each zone for the Midway Landfill Alternative, see Table H2-1 of Appendix H2, Land Use Technical Appendix.

FIGURE 3.4-6
Generalized Zoning
Midway Landfill Alternative

OMF South

3.4.2 Consistency with Regional and Local Comprehensive Plans and Zoning

This subsection evaluates the proposed project's general consistency with applicable comprehensive plan goals and policies and land use regulations, and it specifies potential planning considerations for each build alternative.

The regional and local land use plans for the study areas all encourage increased transit options, reduced vehicle transportation dependency, and expansion of regional growth centers. Regional plans and comprehensive plans for Federal Way and Kent identify the need to use transit to connect urban activity centers to facilitate efficient development patterns, as transit and other multimodal system improvements offer a sustainable approach to growing transportation demand. The Puget Sound Regional Council (PSRC) Vision 2050 (PSRC 2020c) includes several goals within its Growing Transit Communities Strategy that would be served by developing an OMF to support the expansion of the light rail system and service.

OMF South is necessary to enable the delivery of mobility improvements associated with the expansion of the Sound Transit regional light rail system, which will serve Federal Way and Kent. The project would ensure that there is enough storage capacity for, and a location from which to efficiently deploy, the number of vehicles needed to meet Sound Transit's service goals. As a maintenance system for high-capacity transit serving Federal Way and Kent, OMF South could help advance each city's comprehensive plan and land use goals and policies meant to improve high-capacity transit infrastructure and service.

Tables H2-5 and H2-6 in Appendix H2, Land Use Technical Appendix, provide a detailed outline of Federal Way and Kent's comprehensive plan land use goals and policies and OMF South's project consistency. While the tables show various specific goals and policies, policies that are not applicable or relevant to OMF South are not listed.

The Washington State Growth Management Act requires that zoning be consistent with comprehensive plans. It also prohibits local governments from precluding the siting of essential public facilities through their comprehensive plans or zoning. OMF South is a "regional transit authority facility" and is, therefore, explicitly recognized as an essential public facility in the Growth Management Act (RCW 36.70A.200). Once an OMF South alternative is selected, jurisdictions have a "duty to accommodate" the project in their land use plans and development regulations. Recognizing the duty to accommodate essential public facilities, the sections below discuss whether OMF South is a permitted use in the underlying zoning and compare OMF South to similar uses, general dimensional development standards, and the purpose and intent of the zones.

3.4.2.1 Preferred and South 344th Street Alternatives

Table H2-1 in Appendix H2, Land Use Technical Appendix, describes the consistency of the OMF site and mainline tracks in relation to the purpose and intent of relevant zones in Federal Way. The Preferred and South 344th Street alternatives would be located within Federal Way's City Center Core, Commercial Enterprise, Community Business, and Multifamily Residential zones.

As a light rail transit facility, the OMF site and the mainline tracks would be permitted within the Federal Way City Center Core and Commercial Enterprise zones, which specifically permit light rail or commuter rail transit facilities, including support facilities.

For both City Center Core and Commercial Enterprise zones, development standards require no minimum lot size, except for yards along Single-Family Residential zones. The height standard is 75 feet for the City Center Core zone and 50 feet for the Commercial Enterprise zone. Unless located within 100 feet of a Single-Family Residential zone, the structure height may exceed those limitations for both zones if the increased height is necessary to accommodate the structural, equipment, or operational needs of the use.

The greatest height proposed for the OMF lead tracks — which would be in the Multi-Family Residential zones, City Center Core zone, and Commercial Enterprise zone — is estimated at 36 feet, which is within the height standard of 75 feet for the City Center Core and Commercial Enterprise zones.

Light rail transit facility uses are not specifically contemplated in the Community Business and Multifamily Residential zones, but OMF South would be allowed within these zones as an essential public facility. There are no specific development standards for essential public facilities, however, and consequently the bulk, scale, and nature of the light rail transit facility use may not be consistent with the typical uses allowed in the Community Business and Multifamily Residential zones.

To ensure consistency with the Federal Way Comprehensive Plan, OMF South would be required to obtain a city of Federal Way Process IV land use approval from the hearing examiner for any zone in which the project is located, whether it would be a permitted use (as within the Commercial Enterprise zone) or allowed as an essential public facility (as in the Multi-Family Residential zone). Alternatively, an approved Development Agreement with the Federal Way City Council would serve as the project land use approval.

It is acknowledged that Multi-Family Residential zones are intended to provide a range of housing types to accommodate anticipated residential growth. In addition to the potential impacts and minimization measures related to the conversion of lands to a light rail transit facility use analyzed here, Section 3.7, Visual and Aesthetic Resources, and Section 3.9, Noise and Vibration, describe how Sound Transit would minimize aesthetic and noise impacts related to the bulk, scale, and nature of OMF South that could otherwise affect adjacent residents. Further discussion of the project’s potential effects to adjacent residential areas is included in Section 3.2, Transportation; Section 3.5, Economics; Section 3.8, Air Quality and Greenhouse Gas Emissions; and Section 3.17, Parks and Recreational Resources.

Federal Way Revised Code Section 19.135.251, Block Perimeters, requires block perimeters to be no greater than 2,640 feet. While the Preferred Alternative would remove 20th Avenue South, it would extend 18th Place South between S 340th Street and S 336th Street, which would replace the functionality of 20th Avenue S for vehicles, pedestrians, and bicycles. The extended 18th Place S would reduce one block to 4,100 feet and expand one block to 8,700 feet. Both of these blocks are currently nonconforming and are greater than the standard. The South 344th Street Alternative would also not meet the city’s block perimeter requirements because it would not replace 20th Avenue S. Sound Transit would work with Federal Way through the street vacation process to address the standards.

3.4.2.2 Midway Landfill Alternative

Table H2-2 in Appendix H2, Land Use Technical Appendix, describes the consistency of the OMF site in relation to the purpose and intent of relevant zones in Kent. In addition, specific dimensional development standards for all facility uses that fit within commercial and industrial zones, such as Midway Commercial Residential and Commercial Manufacturing, are listed in Table H2-2, as well as dimensional development standards for Single-Family Residential zoning.

Within the Commercial Manufacturing zone, there is a height limitation of two stories, or 35 feet, and maximum site coverage of 50 percent. The economic and community development director may grant one additional story in height if, during development plan review, it is found that the additional story would not detract from the continuity of the area. More than one additional story may be granted by the land use planning board. The highest proposed building height is the OMF office building, at an estimated 36 feet. This proposed building height could require a variance from the code standard due to the 35 foot-height limitation for the Commercial Manufacturing zone. In addition, the proposed development could result in approximately 11 percent of the site being covered with buildings and structures in the Commercial Manufacturing zone, which is below the 50 percent maximum site coverage standard for this zone.

The Midway Commercial Residential zone has an 80 percent maximum site coverage standard. The proposed development would be consistent with the 80 percent maximum site coverage standard because the design would result in less than 3 percent of the site being covered by buildings and structures in this zone.

The design of the tracks would be subject to high-capacity transit design requirements under Chapter 15.15 of Kent City Code. The design requirements are intended to ensure, in part, that high-capacity transit facilities are well designed, support transportation system connections, and adequately buffer different land uses.

Once built, OMF South would be similar in bulk and scale to a light commercial or office development, covering an area similar in size to a shopping center or suburban office complex. The OMF South site use, on the other hand, might be more similar to light industrial use, light rail transit facility, or government facility and public utility use.

Transit operations and maintenance facilities are listed as a conditional use within the Commercial Manufacturing zone. Those portions of the facility planned for the Commercial Manufacturing zone would be subject to a Conditional Use Permit, unless a Development Agreement is pursued because land use approval would be included as a part of the Development Agreement requirements.

The northern lead tracks for the Midway Landfill Alternative would be in the Midway Commercial Residential zone. The Midway Commercial Residential zone lists transportation and transit facilities, including high-capacity transit, as conditional uses. While not listed as a permitted or conditional use, lead tracks are a part of a transportation facility that supports high-capacity transit. The lead tracks are consistent with the intent of the zone and are consistent with the scale and intensity of the mainline tracks associated with transportation and transit facilities. Mainline tracks are a conditional use within the Midway Commercial Residential zone.

A small portion of the Midway Landfill Alternative would be located within the Single-Family Residential-6 zone at the southern edge of the potential construction limits. However, this area would not include elements of the facility itself; rather, it would be used primarily for landscaping and possibly for lead track and roadway improvements. Thus, it is not expected that the OMF site would conflict with the purpose of the Single-Family Residential-6 zone, which is to stabilize and preserve single-family residential neighborhoods. Impacts from the OMF South project could be minimized through building setbacks and landscaped buffers.

For further discussion of the potential effects to adjacent residential land uses see Section 3.2, Transportation; Section 3.5, Economics; Section 3.7, Visual and Aesthetic Resources; Section 3.8, Air Quality and Greenhouse Gas Emissions; Section 3.9, Noise and Vibration; and Section 3.17, Parks and Recreational Resources.

3.4.3 Environmental Impacts

3.4.3.1 No-Build Alternative

Under the No-Build Alternative, land use impacts from construction or operation of OMF South would not occur. However, other planned projects could convert existing land uses, since many of the areas are within commercial, multi-family residential, and mixed-use zones planned for development to accommodate future growth. This includes TDLE, which overlaps with the OMF South Preferred and South 344th Street alternatives. If TDLE is constructed as proposed, the mainline track associated with these OMF alternatives would be built later in time. Impacts associated with construction of the mainline track are addressed within the build alternatives impacts discussion below. All other TDLE-related impacts are addressed in Chapter 4, Cumulative Effects Analysis.

Future population and employment growth are projected to increase by the respective cities' comprehensive plans. Both the Midway Subarea and Federal Way City Center plans have developed goals and strategies meant to support the development of high-capacity transit in their areas. Without the proposed OMF South project, the resulting level of service across the entire light rail system would potentially be lower than planned under Sound Transit 3. This could limit one of the driving factors behind land use conversion from existing lower-density, auto-oriented uses to transit-oriented development or higher-density uses near future stations.

3.4.3.2 Long-Term Impacts

Impacts Common to All Build Alternatives

All the build alternatives would have direct land use impacts through the acquisition of property for OMF facilities, tracks, and associated structures. The discussion below describes the approximate share of each jurisdiction's zoning that would be acquired by each alternative as well as the acreage of land subject to possible land use conversions. The potentially affected properties are detailed in Section 3.3, Acquisitions, Relocations, and Displacements, and in Appendix H1, Potentially Affected Parcels.

For each build alternative, the existing land uses of acquired properties would be converted to a transportation-related use, making them unavailable for potential future uses. Section 3.4.2, Consistency with Regional and Local Comprehensive Plans and Zoning, demonstrates that the OMF South project alternatives are largely consistent with relevant plans and policies, meaning surrounding properties generally would not face direct changes in their land use.

While surrounding properties may experience visual impacts from operation of OMF South, it is not expected that those impacts would be severe enough to result in alteration of existing or potential future land uses. A study by an Urban Land Institute Advisory Services Panel addressed common concerns related to the effects of light rail transit maintenance facilities on air quality, pollutants, nighttime activity, noise, light, and aesthetics. The study conclusion noted that these concerns are likely unfounded for modern light rail maintenance facilities (ULI 2014).

As shown in Table 3.4-1, all build alternatives would acquire a share of their associated city's commercial, mixed-use, and residential zones. If not replaced, conversions of land within commercial and mixed-use zones can result in decreased commercially zoned property, which could possibly spur reductions in sales tax revenue. Land use conversions that reduce residentially zoned areas could decrease the amount of land available for housing growth. Specific acreage of zoning acquired by each alternative is referenced in Table H2-10 of Appendix H2, Land Use Technical Appendix.

Table 3.4-1 Estimated Share of Total Commercial, Mixed-Use, and Residential Zoned Land to Be Acquired

Alternative	Commercial	Mixed Use	Residential
Preferred Alternative			
Mainline[1,2]	0.3%	6.4%	0.7%
OMF Site	1.1%	0.0%	0.6%
Total	**1.4%**	**6.4%**	**1.3%**

Sources: KCC Title 15; FWRC Title 19

Notes: This table shows the share of the project acreage within each city's commercial, mixed-use, and residential zones. See Table H2-10 in Appendix H2, Land Use Technical Appendix, for zoning acreages used to calculate percentages. These areas are approximate and were calculated using GIS tools based on conceptual designs and generalized zoning categories.

(1) For the Preferred and South 344th Street alternatives, the number of acquired parcels would be the same for the mainline track and tail track design options.

(2) If neither the Preferred nor the South 344th Street alternative is selected, the mainline could be built later in time if TDLE is constructed as proposed. TDLE is currently under environmental review.

Table 3.4-2 summarizes the existing land uses and the approximate acreage of affected properties for each alternative that would be converted to a transportation use. The Preferred Alternative would convert the most land (just over 102 acres), the South 344th Street Alternative would convert less land (almost 97 acres), and the Midway Landfill Alternative would convert the least amount of land (approximately 71 acres). Overall, these conversions would make small changes in the local land use development patterns within the affected jurisdictions, but they could alter land use patterns in smaller localized areas.

Table 3.4-2 Amount of Converted Land by Land Uses

Alternative	Commercial	Public/ Institutional	Multi-Family Residential	Single-Family Residential	Vacant Land	Total
Preferred Alternative						
Mainline[1]	8.9	8.1	15.3	1.3	2.3	35.9
OMF Site	6.5	24.5	0.5	6.6	28.5	66.7
Total	**15.4**	**32.6**	**15.8**	**7.9**	**30.9**	**102.6**

Mainline[1]	11.7	8.1	15.3	1.3	3.6	40
OMF Site	15.8	5.6	0.0	9.1	26.3	56.8
Total	**27.5**	**13.7**	**15.3**	**10.4**	**29.9**	**96.8**
Midway Landfill Alternative						
OMF Site	6.5	60.6	0.6	0.2	3.3	71.2

Source: King County Assessor (2022)

Notes: All areas in acres. The estimated total includes the areas within the project's potential construction limits. The acreage is approximate, calculated using graphic information system (GIS) tools; totals may not be exact due to rounding. These are estimates based on conceptual designs. The Preferred and South 344th Street alternatives mainline track and tail track design options include similar existing land uses.

(1) If neither the Preferred nor the South 344th Street alternative is selected, the mainline could be built later in time if TDLE is constructed as proposed. TDLE is currently under environmental review.

Preferred Alternative

As shown in Table 3.4-1, the Preferred Alternative mainline would require the conversion of 0.3 percent of the city's commercially zoned land, 6.4 percent of mixed-use zoned land, and 0.7 percent of residentially zoned land. As shown in Table 3.4-2, the mainline would primarily convert residential land uses (approximately 17 acres), including portions of Belmor, and about 19 acres of commercial land use, public/institutional land use, and vacant land.

The Preferred Alternative OMF site would require conversion of 1.1 percent of the city's commercial zoned land, 0.6 percent residential zoned land, and no conversion of mixed-use land (Table 3.4-1). It would primarily convert existing vacant land (approximately 29 acres) and public/institutional land uses (approximately 25 acres), including the Christian Faith Center (Table 3.4-2).

The OMF site would convert approximately 56 acres of the city's multi-family residentially zoned property, an area intended to be used to accommodate housing growth (Tables H2-2 and H2-10, Appendix H2, Land Use Technical Appendix). Additional detail is provided in Section 3.3, Acquisitions, Displacements, and Relocations.

The Preferred Alternative would include removal of 20th Avenue S between S 336th Street and S 341st Place, to be replaced by 18th Street S, which would be extended from S 340th Street to S 336th Street. Because 20th Avenue S is public right-of-way, Sound Transit would need to petition the Federal Way City Council to vacate 20th Avenue S under Federal Way Revised Code Chapter 4.20, Vacation of Streets, which specifies the requirements, process, and mitigation for removing public rights-of-way. Alternatively, the City Council may initiate procedures by resolution.

South 344th Street Alternative

As shown in Table 3.4-1, the South 344th Street Alternative mainline (including either tail track option) would require the conversion of 6.4 percent of Federal Way's mixed-use zoned land, 1.3 percent of commercial zoned land, and 0.7 percent of residential zoned land. Table 3.4-2 shows that the mainline would mostly convert existing residential, commercial, and public, institutional uses, as well as 3.6 acres of vacant land. The South 344th Street Alternative would have the same impacts through Belmor as described for the Preferred Alternative.

The South 344th Street Alternative OMF site would not require any conversion of mixed-use zoned land but would require conversion of almost 1.8 percent of the city's commercial zoned land (or approximately 36 acres of commercial enterprise zoning). The OMF site would primarily convert existing vacant (26 acres), commercial (approximately 16 acres), and public/institutional land uses (almost 6 acres). Major existing commercial uses include GarageTown and Ellenos Yogurt. Three small church properties are located within areas designated as public/institutional.

The multi-family residential-zoned area affected by the South 344th Street Alternative (0.5 percent) is similar to that of the Preferred Alternative (0.6 percent). Approximately 9 acres of residential land uses would be converted as a result of the OMF site. Additional detail is provided in Section 3.3, Acquisitions, Displacements, and Relocations.

The South 344th Street Alternative would include removal of 20th Avenue S from 300 feet south of S 336th Street and S 341st Place. Because 20th Avenue S is public right-of-way, Sound Transit would need to petition the Federal Way City Council to vacate 20th Avenue S as described for the Preferred Alternative.

Midway Landfill Alternative

As shown in Table 3.4-1, the OMF site would convert about 4.1 percent of Kent's commercial zoning and around 2.8 percent of the mixed-use zoning to a transportation use. While the Midway Landfill Alternative would convert the largest share of a city's commercially zoned land compared to other build alternatives, the existing land use in these areas is mostly public/institutional (primarily the capped landfill) and vacant land. In contrast to all the other alternatives, the Midway Landfill Alternative would not convert any discernible amount of residentially zoned areas. Table 3.4-2 shows the existing land uses that would be converted to transportation uses for the Midway Landfill Alternative. Most land use conversions would be public/institutional land uses (approximately 61 acres) with smaller areas of commercial (under 7 acres) and vacant land (approximately 3 acres).

The residential uses along the north and south boundaries of the site would be near the Midway Landfill Alternative's landscaped yards and stormwater detention pond, which would provide a buffer between the residences and the site.

3.4.3.3 Construction Impacts

Impacts Common to All Build Alternatives

For all build alternatives, there would be temporary noise and vibration impacts from construction activities. The Preferred and South 344th Street alternatives are expected to take approximately 3.5 years to construct, while the Midway Landfill Alternative could take over 8 years, depending on the subsurface construction design option chosen. Construction activities would be carried out in compliance with Sound Transit specifications and all applicable local jurisdiction noise regulations. In addition, the visual impact of construction is expected to be noticeable but temporary and no more impactful than other large construction projects. Changes in visual character are expected to be visible to surrounding viewers but would occur only within the project site boundaries. Sections 3.7, Visual and Aesthetic Resources, and 3.9, Noise and Vibration, discuss these construction impacts in more detail.

Because all construction activities, including staging, are expected to occur within the potential construction limits of the build alternatives and measures to minimize construction impacts and best management practices (BMPs) would be incorporated into the project, overall construction impacts on adjacent land uses are expected to be minimal. All build alternatives are anticipated to have minor impacts to property access and existing pedestrian and bicycle facilities. However, traffic volumes are estimated to increase throughout the study areas during peak hours. Increased traffic from construction could temporarily affect businesses in the project area but would not lead to long-term changes in land use because the construction haul routes would primarily use SR 99, I-5, and arterials that already experience large volumes of traffic. See Section 3.2, Transportation, for an analysis of construction impacts.

Given that most construction impacts are expected to be minimal and temporary, there would not be direct alteration of land use due to impairment or prevention of the primary function of such land.

3.4.3.4 Avoidance and Minimization of Impacts

The facility design process for OMF South would be developed according to Sound Transit's systemwide design goals and criteria as well as the design goals, criteria, and development patterns of the local municipality. The project would incorporate context-sensitive design considerations, which would likely vary based on local comprehensive plans, zones, and development standards related to building setbacks, landscaping, heights and massing, façade treatment, and urban design character. Site-specific design measures intended to increase compatibility with surrounding properties, such as landscaping for screening, would be developed during final design, in consultation with Federal Way or Kent, through the land use approval process.

Sound Transit would minimize construction and operation impacts that could otherwise affect adjacent land uses, as described in Sections 3.2, Transportation; 3.5, Economics; 3.7, Visual and Aesthetic Resources; 3.8, Air Quality and Greenhouse Gas Emissions; 3.9, Noise and Vibration; and 3.17, Parks and Recreational Resources.

The proposed project would result in direct long-term changes to existing land use. Any land use conversions would comply with local government planning and permitting procedures before the project is built. Section 3.3, Acquisitions, Displacements, and Relocations, includes more information on how Sound Transit would minimize property impacts and relocations.

3.4.3.5 Indirect Impacts

Indirect impacts are changes that may occur as a result of the proposed project in the future and in areas beyond the project's direct and short-term impacts. Indirect proximity impacts may include traffic, noise, visual impacts, and changes in adjacent land uses.

OMF South would provide Sound Transit with additional capacity to receive, test, commission, store, maintain, and deploy an expanded fleet of light rail vehicles, which would allow for more efficient operations of existing and future expansions of the light rail system than would occur without the facility. Improved light rail transportation service serving Federal Way and Kent could result in increased convenience and desirability of surrounding residential, commercial, and office properties. This may help advance parts of the cities' subarea and comprehensive plans, which include goals of increasing high-capacity transit and creating walkable, vibrant street life around transit facilities. Other benefits related to successful transit-oriented development include improved mobility, increased transit ridership in a more efficient urban form, and opportunities for urban redevelopment. As noise and visual impacts are likely to be minimal in the long term, no indirect impacts on land use are expected.

3.4.4 Mitigation Measures

In general, OMF South would be consistent with adopted comprehensive plans and land use policies, and no specific mitigation related to land use or zoning is anticipated.

3.5 Economics

This section describes the potential economic effects associated with the OMF South project alternatives. This economic analysis addresses the ways that land acquisition, construction, and operation of OMF South would impact economic conditions at and in the vicinity of the project sites and in the broader area. The alternatives were evaluated across several levels of geography. Site-specific effects were evaluated at each proposed OMF site and up to 0.5 mile from the potential construction limits of the build alternatives. Potential displacement of business activity and tax revenues were evaluated at the city level for Federal Way and Kent. Regional economic activity, such as jobs and labor income, were evaluated for the Puget Sound region, which includes King, Kitsap, Pierce, and Snohomish counties.

3.5.1 Affected Environment

3.5.1.1 Regional Demographic and Economic Trends

Employment in the Puget Sound region increased from 1.9 million in 2000 to 2.3 million jobs in 2018 (PSRC 2020a). During the same time period, median household income increased from approximately $45,000 to over $75,000 in Pierce County and from $55,000 to $95,000 in King County (PSRC 2020b).

Table 3.5-1 provides the population, household, and employment forecasts for the Puget Sound region and associated counties. The PSRC forecast for the region shows that the population will grow by over 1.6 million people between 2020 and 2050, reaching over 5.8 million by 2050. This amounts to an average 1.06 percent increase in population per year (PSRC 2022). PSRC data from 2022 shows that both King County and Pierce County will grow at a slower pace of 1.03 percent.

The number of households in the Puget Sound region is predicted to grow by approximately 765,102 between 2020 and 2050 — or by 1.27 percent per year — which would be faster than the overall population growth of 1.06 percent per year; this essentially reflects faster growth in smaller households. Travel demand typically tracks more closely to growth in the number of households than to population, suggesting a possible increase in travel demand.

Median household income in the Puget Sound region is higher than the state average. In 2018, King County had the highest median household income in the region, at about $95,000, while Pierce County ranked fourth at about $75,400 (PSRC 2019). From 2013 to 2018, incomes in King County grew by about 33 percent, while Pierce County incomes increased by about 31 percent. The U.S. Census Bureau reports that, in 2018, the median household income was $68,880 for Kent and $66,011 for Federal Way (PSRC 2020b).

Employment in the region is expected to grow at an approximate average rate of 1.18 percent through 2050. King County is expected to have faster job growth than Pierce County, at 1.87 percent per year versus Pierce County at 0.70 percent per year. These trends support the predictions of increased travel demand in the region and along the project corridor.

Table 3.5-1 Population, Household, and Employment Forecasts by Region and County

	2020 Actual	2050 Forecast	Average Annual Growth Rate, 2020 to 2050
Puget Sound			
Population	4,240,910	5,827,203	1.06%
Household	1,657,501	2,422,603	1.27%
Jobs	2,356,277	3,346,915	1.18%
King County			
Population	2,225,064	3,029,767	1.03%

Source: 2020 Actual (U.S. Census Bureau, 2020 ACS 5-Year Estimates); 2050 Forecast (PSRC 2022).

3.5.1.2 Study Area Demographic and Economic Trends

Table 3.5-2 shows the growth of population, households, and jobs from 2020 to 2050 based on the PSRC Forecast Analysis Zone (FAZ) for the build alternatives. FAZs are geographic units used by PSRC to model and report its population, households, and employment forecasts. PSRC's Vision 2050 anticipates population and employment in the Puget Sound region will continue to grow over the next 30 years. PSRC acknowledges that the COVID-19 pandemic may have had effects on the economy that could alter long-range forecasts. For purposes of this Final EIS, the Vision 2050 forecasts were used for analysis.

Table 3.5-2 Population, Household, Employment Forecast by FAZ

	2020 Actual	2050 Forecast	Average Annual Growth Rate, 2020 to 2050
Central Federal Way (FAZ 3020)[1, 2]			
Population	26,950	54,507	2.38%
Households	10,371	22,255	2.58%
Jobs	13,035	37,555	3.59%
Des Moines (FAZ 3046)[3]			
Population	25,015	42,485	1.78%
Households	9,661	17,710	2.04%
Jobs	12,208	16,668	1.04%

Source: 2020 Actual (U.S. Census Bureau, 2020 ACS 5-Year Estimates); 2050 Forecast (PSRC 2022).

Notes:

(1) Preferred and South 344th Street alternatives.

(2) The U.S. Census Bureau does not provide actual population statistics for a single geographical boundary that directly matches the PSRC Central Federal Way FAZ 3020. Therefore, the 2020 Actual population numbers represent the sum the 2020 actual population for Census Tracts 300.05, 300.06, 302.03, 302.04, 303.13, and 303.14, all of which are encompassed within and align with the geographical boundaries of the PSRC Central Federal Way FAZ 3020.

(3) Midway Landfill Alternative.

The Preferred and South 344th Street alternatives are in the Central Federal Way FAZ 3020, which is bordered by I-5 and SR 99, shown in Figure 3.5-1. Between 2020 and 2050, household growth in FAZ 3020 is expected to continue at about 2.58 percent annually. Population and jobs are expected to grow as well, at 2.38 and 3.59 percent annually, respectively.

The Midway Landfill Alternative is in PSRC FAZ 3046, called the Des Moines area, although it includes a portion of Kent, shown in Figure 3.5-1. FAZ 3046 is forecast to experience a 1.78 percent growth rate in population, a 2.04 percent growth rate in households, and a job growth rate of 1.04 percent between 2020 and 2050.

Table 3.5-3 shows the forecasted number of jobs by sector from 2018 to 2050 for the build alternatives. Employment in census tract 303.13, which contains both the Preferred and South 344th Street alternatives, has a high concentration of finance, insurance, real estate, and services employment sector jobs, with over 50 percent falling into this category in 2018. By 2050, this share is expected to decrease slightly, to about 49 percent.

Employment in census tract 290.04, which surrounds the Midway Landfill Alternative, was primarily concentrated in the retail/food services and finance, insurance, real estate, and services employment sectors in 2018, each with substantial employment. Retail was the largest concentration in 2018, with approximately 48 percent of jobs. By 2050, the education employment sector, construction employment sector, and finance, insurance, real estate, and services employment sectors are expected to grow at a faster rate.

Table 3.5-3 Employment Forecasts by Census Tract

	2018 Estimated Jobs	2018 Share	2050 Forecast Jobs	2050 Share	Compound Annual Growth Rate, 2018 to 2050
Preferred and South 344th Street Alternative: Census Tract 303.13

3.5.1.3 Local Revenue Sources

Table 3.5-4 shows the revenue sources for both Federal Way and Kent. The revenue sources are listed both by total dollar amounts and by percentage of total budget, based on the 2021 to 2022 adopted budget for each city. It is unknown at this time what effect, if any, the COVID-19 pandemic may have on future revenues.

Table 3.5-4 General Fund Revenues for Federal Way and Kent

Revenue Source	Federal Way Total	Federal Way Share	Kent Total	Kent Share
Property Tax	$10,252,674	19.5%	$32,151,450	28.9%
Sales Tax	$18,977,116	36.0%	$19,943,030	17.9%
Utility Tax	--	--	$17,757,970	16.0%
Business and Occupation Tax	--	--	$19,100,000	17.2%
Other	$23,481,773	44.5%	$22,219,600	20.0%
Total	**$52,711,563**	**100%**	**$111,172,050**	**100%**

Sources: City of Federal Way 2021-2022 Adopted Budget (City of Federal Way 2020); City of Kent 2021-2022 Adopted Budget (City of Kent 2021)

Note: Utility and business and occupation taxes are not included in Federal Way's General Fund.

Federal Way primarily collects its general fund revenue from "other" taxes, which include licenses and permits, intergovernmental taxes, charges for services, fines and penalties, etc. Sales tax brings in more revenue than property taxes, generating 36 percent of the general fund at nearly $19 million. Federal Way's general fund supports 10 primary departments: city council, mayor's office, municipal court, law, finance, human resources, city clerk, community development, police department, and parks, recreation, and cultural services.

Property taxes are the largest revenue source for Kent. For the 2021 adopted budget, property taxes represented 28.9 percent of the general fund revenue at more than $30 million. Sales, utility, and business and occupation taxes are also important sources of revenue that collectively account for just over 50 percent of the city's general fund revenue. Kent's general fund finances the majority of the traditional services associated with local government.

3.5.1.4 Regional Transportation of Goods and Services

I-5 is the primary corridor for regional and interstate commerce in the study region, while SR 99 is a designated freight route through Federal Way and Kent. I-5 is heavily congested during peak periods, which results in longer travel times, decreased reliability, and increased operating costs. While some businesses may choose to shift deliveries to non-peak hours, other companies may choose alternate routes to maintain reliable pickup and delivery times. Heavy congestion can also constrain access to labor as workers seek to minimize commute times. As a result, businesses may respond by expanding to other areas in the metropolitan region or by relocating outside of the region. A more detailed discussion about the existing freight use and throughput along the I-5 corridor is described in Section 3.2, Transportation.

3.5.2 Environmental Impacts

3.5.2.1 No-Build Alternative

Under the No-Build Alternative, economic impacts from construction or operation of OMF South would not occur. However, other planned projects would have impacts in the OMF South study areas. Once operational, FWLE would likely encourage private, transit-oriented development in the Midway Landfill Alternative study area, increasing property tax and sales tax revenues for local jurisdictions. Other planned projects may also have economic impacts, depending on the extent of business displacements and land use changes. This includes TDLE, which overlaps with the OMF South Preferred and South 344th Street alternatives. If TDLE is constructed as proposed, the mainline track associated with these OMF alternatives would be built later in time. Impacts associated with construction of the mainline track are addressed within the build alternatives impacts discussion below. All other TDLE-related impacts are addressed in Chapter 4, Cumulative Effects Analysis.

Under the No-Build Alternative, future economic development at the proposed sites would continue on its current course for the foreseeable future and in accordance with current planning goals. Sound Transit would be constrained due to the lack of enough LRVs to meet the projected service needs of Sound Transit 3, which would result in increasing passenger loads as the population of transit users grows. These loads may continually meet or exceed capacity. Fleet constraints may also cause operational disruptions and inefficiencies, which could lead to economic effects resulting from reduced ridership and, as a result, could substantially affect each passenger's ability to travel throughout the Sound Transit service area. Increasing constraints on the transportation network could affect labor productivity as the costs (in time and expense) to commute to and from work increase.

3.5.2.2 Long-Term Impacts

Impacts Common to All Build Alternatives

For all build alternatives, the construction of OMF South may cause changes in the local area due to the acquisition of land that is currently used for other purposes, and impacts would primarily arise from displacement of employees and businesses on properties that are acquired and converted to public transit uses. Displacing those businesses would also initially change the amount of property tax burden and sales taxes collected in the local jurisdictions. If businesses are displaced outside of the region, business and occupation taxes and retail sales taxes could also be affected.

Once the project is constructed, approximately 610 staff would be employed to support the operation of OMF South, making it one of the larger employers in the area. These estimates are based on interviews, past experiences at other Sound Transit OMFs, and Sound Transit's projections on needed staff. This additional source of employment would help benefit the regional economy and reduce the impact from jobs displaced by the project alternatives (see Table 3.5-5).

Regional Transportation of Goods and Services

SR 99 is a designated freight route through Federal Way and Kent. The potential impacts associated with the OMF South build alternatives are not anticipated to negatively impact regional freight mobility in the study area. Freight traffic would experience similar travel times as the No-Build Alternative, and the cost of moving goods and services through the study region is not anticipated to increase as a result of the build alternatives. Similarly, it is not likely that the proposed alternatives for OMF South would result in increased congestion along the I-5 corridor. Section 3.2, Transportation, and Appendix G1, Transportation Technical Report, discuss potential transportation impacts in more detail.

Potential Business Displacement

Table 3.5-5 lists the number of businesses and employees that may be disrupted or displaced due to property acquisition. These estimates represent a likely upper bound of the potential direct displacement of employees across the proposed build alternatives. If businesses can relocate within the existing community or the broader affected area, the economic effect of displacement may be smaller.

Table 3.5-5 Property Acquisition Impacts on Businesses and Employees

Alternative	Total Affected Businesses[1]	Business Displacements[2]	Employee Displacements[3]
Preferred Alternative

Source: King County Assessor (2024)

Notes:

(1) Total affected businesses include full and partial property acquisitions. Religious facilities (e.g., churches) are also included in affected business totals.

(2) Business displacements include both businesses and religious facilities for fully acquired parcels only.

(3) The number of displaced employees is based on the business building size (King County Department of Assessment data) and the type of business activity using square-foot-per-employee factors from the U.S. Department of Energy and the Institute for Transportation Engineers and not on an actual survey of businesses. The analysis for estimating employees assumes that the businesses are not abandoned or vacant.

(4) With either the 40 mph Alignment or 55 mph Design Option.

(5) If neither the Preferred nor the South 344th Street alternative is selected, the mainline could still be built later in time if TDLE is constructed as proposed. TDLE is currently under environmental review.

(6) With either the Enchanted Parkway or I-5 mainline tail track options.

(7) Includes GarageTown, comprising 67 individual units.

The effects of potential business displacements are complex. Substantial displacement of local businesses can affect residents and businesses alike. Often the direct impacts for displaced businesses are financial, but there can be other consequences as well.

Businesses are affected differently based on their characteristics. Firm size and community importance may determine the level of impact on employment and to the community. For example, small and minority-owned businesses that rely on a localized customer base may have more difficulty finding suitable locations. Many of these businesses support local economic growth and innovation in the communities they serve. Businesses that use machinery or hazardous substances may require large parcels or have additional challenges that may make relocation difficult. Further, a business may have a suitable place to relocate, but the new location could limit access to its existing labor pool.

Relative to the employment base in the study region, the estimated number of employees displaced from the proposed build alternatives is small. Sound Transit would provide relocation assistance to businesses that are displaced, as described in Section 3.3, Acquisitions, Displacements, and Relocations. Depending on the extent to which displaced businesses are able to be relocated within the existing community or the broader affected area, these estimates do not necessarily reflect potential job losses in the study region.

This analysis cannot assess other characteristics of business vulnerability from displacement. Information about profitability or economic competitiveness of individual businesses is not publicly available. While these characteristics may be considered along with the broader social impacts of business disruption from the project alternatives, they are outside the scope of this Final EIS (WAC 197-11-448). Other anticipated socioeconomic impacts related to business and employee displacement are discussed in Section 3.6, Environmental Justice, Social Resources, Community Facilities, and Neighborhoods.

Impact of Displacement on Tax Base

All the build alternatives would acquire parcels that have existing commercial or industrial activity. Businesses located within these parcels pay a sales tax. Businesses in Kent also pay a business and occupation tax, as shown in Table 3.5-4. The acquisitions for OMF South could result in initial reductions of sales and business and occupation taxes by displacing those existing businesses. If some businesses were to relocate to another area within the city, they would resume paying sales and business and occupation taxes, reducing the effect on taxes. Retaining those displaced businesses could reduce the effect on local sales taxes. However, calculating the specific reductions for such taxes is not possible, given the inability to know exactly how many businesses would relocate and remain within each city.

Similarly, it is not possible to calculate specific property tax impacts due to complex property tax policies in the state of Washington. The acquisitions would initially reduce property taxes in Federal Way and Kent; however, the impact is expected to be small. The reduction of developable properties may affect the property tax base in the region by lowering the potential for new construction on acquired properties. This may require changes in local government budgets or an increase in rates to taxpayers to recover budgeted funds. Local governments would be constrained to the annual 1 percent levy rate increases to cover existing costs unless certain exemptions apply. However, some of the initial tax revenue displacement would be offset through sales taxes for construction-related purchases that occur within the local jurisdiction.

If the project were to promote future development and investment in the local vicinity, property tax assessments could increase. However, the project could also result in shifting demand across the region, so that while assessments adjacent to new development may increase, property tax assessments in other areas of the city might stagnate. Overall, the impact is expected to be small given the reduction in taxable assessed valuation of acquired properties in relation to the area’s overall tax base (see Table 3.5-6). For example, the total taxable assessed valuation of real property for full and partial acquisitions for the South 344th Street Alternative accounts for 0.72 percent of Federal Way’s overall assessed valuation in 2022; none of the alternatives exceed 1 percent.

Table 3.5-6 Total Taxable Assessed Valuation by Alternative

Alternative	Total Parcels	Total Taxable Value	Jurisdiction Total Taxable Value[1]	Acquired Jurisdiction Taxable Share
Preferred Alternative				
Mainline[2,3]	7	$31.4 M	$13.9 B	0.23%

Source: King County Assessor (2022)

Notes:

(1) Jurisdiction is Kent for the Midway Landfill Alternative and Federal Way for the Preferred and South 344th Street alternatives.

(2) With either the 40 mph Alignment or 55 mph Design Option.

(3) If neither the Preferred nor the South 344th Street alternative is selected, the mainline could be built later in time if TDLE is constructed as proposed. TDLE is currently under environmental review.

(4) With either the Enchanted Parkway or I-5 mainline tail track options.

Preferred Alternative

The Preferred Alternative OMF site would displace the Christian Faith Center, a religious facility with an associated private school, resulting in the disruption of approximately 92 jobs. Although neither entity is taxable, they represent the two largest sources of employment that would be disrupted. Other displaced businesses include warehouse and storage buildings and a garage service repair shop that would have much smaller employee displacements.

South 344th Street Alternative

The South 344th Street Alternative OMF site would disrupt some light manufacturing in the area. Ellenos Yogurt recently made investments to its facility and has stated that many of the improvements could not be moved. Additionally, GarageTown houses 67 individually rented or owned storage facilities. Both businesses would be difficult to relocate. For Ellenos Yogurt, it is unlikely that there is an existing facility with the same manufacturing equipment required for producing yogurt. GarageTown is less likely to have large, specialized capital requirements, but does have a large footprint; it may be difficult to find a site within the same area that also provides ease of access for its existing customer base. The South 344th Street Alternative would displace other warehouse and storage businesses, office buildings, and three churches, but these properties would result in a small number of employee displacements.

Based on the existing vacancy rates for retail and industrial sites in the region, there is potential capacity for the other displaced businesses to relocate. If any of the firms relocate outside of Federal Way, however, the city may lose some benefits from local consumption and contributions to the tax base. Although the total value added from the firms is unknown, the potential job displacement as a total share of employment in the region is small (see Table 3.5-5) and dependent on whether affected businesses relocate in the area or not. None of the identified businesses appear to be heavy industry or to use large amounts of toxic substances, which could otherwise make relocation difficult.

Midway Landfill Alternative

The Midway Landfill Alternative would have the smallest impact on employment displacements (see Table 3.5-5), and the identified businesses would likely be able to relocate to nearby properties. The affected businesses are an insurance business, an optometry clinic, and two warehouse businesses; the other affected parcels around the closed Midway Landfill are mostly vacant.

3.5.2.3 Construction Impacts

Construction supports economic activity through the purchase of goods and services and labor income in the study area. The economic contributions arising from construction projects are often temporary in nature and occur as construction spending unfolds. While the infusion of new money on capital projects can be beneficial to a region, residential and commercial sites that are adjacent to the proposed sites may experience some disruption and other adverse effects from construction. However, investments in capital projects that can reduce future congestion and pollution may have broader long-run benefits than what is typically measured in short-run economic impact analyses.

Construction activity may disrupt current economic activity by increasing traffic delays and may result in other negative externalities, such as increased noise adjacent to the construction site. However, those effects are anticipated to last only through the duration of the construction phase. The project is not expected to result in large changes in access to nearby businesses or lead to changes in existing transportation networks. Please see Sections 3.2, Transportation, and 3.9, Noise and Vibration, for more discussion on potential impacts during construction.

Table 3.5-7 displays the gross economic contributions from each build alternative. As shown, employment and spending would increase during construction for all the alternatives. The Preferred and South 344th Street alternatives have similar expenditure and employment estimates, while the Midway Landfill Alternative estimates are greater due to its longer construction period. Construction would bring revenue into the economy with the jobs that it produces, and the money spent by construction employees in the surrounding community. The extent of these impacts would depend on the source of project funding and the types of work crews performed.

These results do not differentiate between new economic activity in the region and activity that is repurposed as a result of this project, nor do they account for the opportunity cost of using those public dollars for an alternative use. The preferred approach for these analyses is to account only for new capital that would flow into the region for each alternative; however, that information was not available for this analysis. Instead, the values above represent the gross contributions, or “economic footprint,” associated with each alternative. As such, it represents an upper-bound estimate of economic activity associated with the project.

The direct expenditures and employment shown in Table 3.5-7 represent spending and jobs directly related to the project alternatives. Total economic output and total employment account for both the direct, supply chain, and consumption effects associated with each alternative, known collectively as secondary effects. These secondary effects are represented by economic multipliers, which trace how spending is distributed across other industries to support economic activities in a study region.

Table 3.5-7 Direct Expenditures and Direct Employment During Construction

Alternative	Direct Expenditures[1]	Total Economic Output[2]	Direct Employment (Job Years[3])	Total Employment (Job Years[3])
Preferred Alternative				
Mainline[4]	$.338 – .427 B[5]	$.661 – .835 B	1,157 – 1,462	2,550 – 3,221

Sources: Sound Transit and Washington Office of Financial Management Input-Output Model 2015.

Notes:

(1) Direct expenditures exclude construction contingency allowance and the purchase of land.

(2) The multipliers from the Washington Office of Financial Management Input-Output model are representative of the State of Washington and differ from economic multipliers created for the four-county PSRC region.

(3) A job year is defined as full-time employment for one person over the course of a year (assuming 2,080 hours of employment per year).

(4) If neither the Preferred nor the South 344th Street alternative is selected, the mainline could be built later in time if TDLE is constructed as proposed. TDLE is currently under environmental review.

(5) Values expressed in a range consistent with Table 2.5-1 to reflect conceptual nature and preliminary level of design.

Construction spending (excluding land and equipment) tends to have a high multiplier, as many of the labor and capital inputs are supplied locally. Based on the multipliers in the 2012 Washington Office of Financial Management Input-Output model (revised in 2015), every $1 million spent on construction activity supports an additional $956,000 in economic output. As mentioned previously, expansionary projects can result in increased economic capacity but result in only a short-run increase in output and jobs. Often the impacts calculated from construction spending dissipates as project spending declines.

3.5.2.4 Avoidance and Minimization of Impacts

Construction might cause adverse temporary impacts on businesses due to reduced access or nuisances associated with general construction activity such as noise, vibration, or dust. Avoidance and minimization measures as described in the following sections would reduce these impacts: Section 3.2, Transportation; Section 3.3, Acquisitions, Displacements, and Relocations; Section 3.7, Visual and Aesthetic Resources; Section 3.8, Air Quality and Greenhouse Gas Emissions, and Section 3.9, Noise and Vibration.

During final design and permitting, construction plans would be developed to address the needs of businesses and could include, but are not limited to, the following elements:

- Provide a 24-hour construction telephone hotline.
- Establish effective communications with the public through measures such as meetings and construction updates, alerts, and published schedules.

- Provide an ombudsman consistent with Sound Transit policy. If complaints arise about construction impacts that cannot be resolved by community outreach staff or the relevant department director, the ombudsman policy provides a process for addressing those complaints in an impartial, fair, and timely manner that ensures effective stewardship of public resources and minimizes construction impacts.
- Provide detour, open-for-business, and other signage as appropriate.
- Maintain access as much as possible to each business and coordinate in advance with businesses during times of limited access.

3.5.2.5 Indirect Impacts

OMF South could have indirect economic impacts on properties adjacent to the construction site from temporary changes in traffic flow, noise levels, and visuals that could result in changes to business sales or property values. Impacts to local businesses are anticipated to be minor and last only through the duration of the construction phase. No substantial changes in existing transportation networks or access to nearby businesses are expected because of construction for any of the OMF South build alternatives.

For the Midway Landfill Alternative, residential properties adjacent to the project site may gain some marginal benefits from increased property values, depending on the extent of landfill remediation associated with the OMF South project. For example, the Full Excavation subsurface design option would completely remove the contaminated landfill material and would likely have the greatest positive effect on neighboring property values of the three options. Many economic analyses have found that clean-up of designated Superfund sites can have a positive effect on adjacent property values, but information about the timing and magnitude of that effect varies greatly across sites (Kiel and Williams 2007).

Other amenities that affect property values, such as proximity to green space, are not anticipated to be impacted by any of the build alternatives.

3.5.3 Mitigation Measures

No specific mitigation related to economic impacts is anticipated.

3.6 Environmental Justice, Social Resources, Community Facilities, and Neighborhoods

This section evaluates how the OMF South project alternatives could affect environmental justice, social resources, including community facilities, neighborhood character, community cohesion, and safety and security within the study area. For the purposes of this analysis, social resources include community amenities, government and Tribal entities, affordable and senior housing, medical facilities, recreation facilities, religious centers, schools, social service providers, and transportation facilities. Community cohesion refers to a community member's sense of belonging to a neighborhood and the degree to which community members interact with other community members and social resources in the neighborhood. The study area includes all social resources within 0.5 mile of the potential construction limits of each OMF South build alternative. Due to their close proximity, a single study area was identified for the Preferred and South 344th Street alternatives.

Consistent with FTA Title VI Circular and the FHWA Community Impact Assessment: A Quick Reference for Transportation, four key neighborhood and community issues were used to evaluate the project's potential impact on the study area (FTA 2012; FHWA 2018):

- Changes in neighborhood quality
- Barriers to social interaction
- Impacts on community resources
- Impacts on safety and security

Potential impacts to environmental justice populations are summarized in Section 3.6.3, Environmental Justice Summary below and are discussed in more detail in Appendix E, Environmental Justice Assessment.

3.6.1 Affected Environment

Figure 3.6-1 shows the neighborhoods within the OMF South study areas, and Figure 3.6-2 and Figure 3.6-3 show all social resources within the study areas, including both subsidized (affordable) and nonsubsidized housing below market rate within the study area. Affordable housing was identified in the study area by reviewing information from the U.S. Department of Housing and Urban Development and King County Housing Authority to identify properties and housing developments that provide subsidized housing or housing assistance for low-income and cost-burdened families. Additional nonsubsidized below-market-rate housing within the study area is available through private developments, such as apartment complexes, manufactured or mobile home developments, and RV parks.

A low-income person is identified as a person whose household income is at or below the U.S. Department of Health and Human Services poverty guidelines (FTA 2012). The 2022 poverty guideline is an annual income of $13,590 for a household of one and $27,750 for a household of four (HHS 2022). Sound Transit's low-income threshold is two times the federal poverty level, which the agency has determined is appropriate for use in determining eligibility for a reduced fare program and reflects the increasingly high cost of living in the region.

OMF South

3.6.1.1 Study Area Characteristics

Preferred and South 344th Street Alternatives

The combined study area for the Preferred and South 344th Street alternatives is primarily within Federal Way and includes portions of unincorporated King County, which are part of Federal Way's Potential Annexation Area. The mainline track for these alternatives begins at Federal Way Downtown Station, which is in the Federal Way City Center core.

The Preferred and South 344th Street alternatives are both in the Kitts Corner neighborhood, and the study area intersects the following neighborhoods: Mirror Lake, Steel Lake, Lake Dolloff, and Federal Way West Campus (Figure 3.6-1). The study area consists primarily of commercial land uses in addition to residential, institutional, and vacant parcels. Commercial uses are concentrated around The Commons at Federal Way shopping center and are also mixed with industrial uses along SR 99.

Residential uses within the study area are concentrated in the area along the mainline tracks between The Commons shopping center at S 324th Street and the northern boundary of the Preferred Alternative at S 336th Street. This primarily residential area includes numerous apartment and condominium complexes in addition to two mobile home parks: Charwood Mobile Home Park and Belmor Mobile Home Park. Charwood Mobile Home Park has space for 74 mobile home units. Belmor is a 63-acre mobile home park for adults 55 years and older that contains over 300 mobile home units and a nine-hole golf course. The property includes other amenities, including a pool, craft room, exercise room, and clubhouse. There are also several single-family homes along S 340th Street and 18th Place S. Community cohesion within apartment, condominium, and mobile home complexes is likely relatively high given the shared spaces and close proximity of housing units. However, most of the residential developments are separate and distinct, potentially discouraging interactions between neighborhoods and subdivisions.

Figure 3.6-2 depicts social resources in the study area for the Preferred and South 344th Street alternatives. Numerous religious facilities are in the study area, including the Christian Faith Center, Voice of Hope Church, Family Life Community Church, and the Redwood Church of God and Tabernacle Temple of Praise, which share a building. The Christian Faith Center has an affiliated school called the Pacific Christian Academy. There are also several healthcare centers and government services, including a post office, a Department of Licensing location, and the Greater Federal Way Chamber of Commerce. Additional social resources include parks, transit facilities, education facilities, and nonprofit organizations. Affordable housing in the study area is provided by King County Housing Authority at Kings Court Apartments and Evergreen Court Apartments. Properties offering nonsubsidized below-market-rate housing in the study area include Madrona Park Senior Living, Meridian Court Apartments, Villa Esperanza Apartments, Belmor, Charwood Mobile Home Park, Celebration Senior Living, and Kitts Corner Apartments.

Midway Landfill Alternative

The Midway Landfill Alternative study area is primarily in Kent and also includes parts of Des Moines and unincorporated King County, which are part of the city's Potential Annexation Area. The study area includes a substantial portion of the Midway Subarea, which was identified in the Midway Subarea Plan as an area with development potential associated with future light rail transit (City of Kent 2011). The Midway Subarea is along the western border of Kent between I-5 and SR 99 and between SR 516 (Kent-Des Moines Road) and S 272nd Street (Figure 3.6-1). It includes primarily commercial land uses along SR 99, including restaurants, retail shops, automotive services, and large "big box" stores, such as Lowe's and Fred Meyer.

There are also some vacant and industrial land uses and a limited number of residential parcels within the Midway Subarea.

Outside of the Midway Subarea, the Midway Landfill Alternative study area contains mostly residential areas east of I-5, west of SR 99, and south of S 252nd Street. Most residential parcels in the study area are single-family homes, in addition to some multi-family dwellings and mobile homes. The Midway RV and Mobile Home Park is directly north of the Midway Landfill and contains approximately 35 mobile home units.

The following neighborhoods intersect with the Midway Landfill Alternative study area: Pacific Ridge, Saltair Hills, Woodmont Beach, and West Hill (Figure 3.6-1). Community cohesion within dense, single-family neighborhoods is likely high; however, several barriers likely prevent interaction between neighborhoods. On the east side of the Midway Landfill Alternative, I-5 acts as a barrier between the West Hill neighborhood and the site; on the west side of the Midway Landfill Alternative, SR 99 acts as a barrier between the Saltair Hills and Woodmont Beach neighborhoods and the site.

Social resources in the Midway Landfill Alternative study area are depicted in Figure 3.6-3. The study area includes education facilities, such as Highline College and two Highline School District elementary schools. Highline College is a community college with over 17,000 total students and provides community resources for the surrounding area. There is a WorkSource Connection Site located at Highline College, which provides employment and training services to the community. The study area also includes community facilities, such as parks and religious facilities. Affordable housing in the study area is provided by King County Housing Authority at Campus Court Apartments. Properties offering nonsubsidized below-market-rate housing in the study area include Green Acres Mobile Home Park, Jackson Mobile Home Park, Mar Villa Mobile Home Park, Tip Top Trailer Park, New Alaska Trailer Park, Midway RV and Mobile Home Park, and West Hill Mobile Home Park.

3.6.1.2 Population Characteristics

Table 3.6-1 provides a summary of demographics in the study areas and compares the population characteristics to those of the three cities within the study areas (Federal Way, Kent, and Des Moines), the Sound Transit district, and King County as a whole. The Sound Transit district is composed of 53 cities in King, Pierce, and Snohomish counties and includes a population of approximately 3.2 million people.

Federal Way, Kent, and Des Moines have higher proportions of both low-income and minority residents when compared to all of King County and the Sound Transit district, and both study areas have higher proportions of low-income and minority persons than the three cities. The Midway Landfill Alternative study area has the highest percentages of both low-income and minority persons, at 44 percent and 68 percent, respectively.

Table 3.6-1 Study Area Demographics

	Preferred and South 344th Street Alternatives Study Area	Midway Landfill Alternative Study Area	Federal Way	Kent	Des Moines	King County	Sound Transit District
Total population	9,531	10,712	96,812	130,038	31,983	2,225,064	3,189,953
Population under 5 years old	7%	10%	7%	7%	6%	6%	6%
Population over 64 years old	15%	7%	14%	11%	18%	13%	13%
Minority[1]	66%	68%	57%	58%	48%	42%	42%
Low-income[2]	39%	44%	28%	30%	33%	18%	21%

Source: U.S. Census Bureau, American Community Survey (ACS) 2016-2020 5-Year Estimates

Notes: Percentages represent estimates based on survey data. Survey data are not available at the census-block level; the data represents an estimate of minority and low-income persons in block groups within 0.5 mile of each build alternative.

(1) Minority is defined as all race/ethnicity groups except for “Non-Hispanic White Alone.”

(2) Low-income is defined the number or percent of a block group’s population in households where the household income is less than or equal to twice the federal poverty level.

3.6.2 Environmental Impacts

3.6.2.1 No-Build Alternative

Under the No-Build Alternative, there would be no property acquisitions or other related changes associated with the OMF South project. However, other planned projects in the area could have social impacts, depending on the extent of the associated disruption. This includes TDLE, which overlaps with the OMF South Preferred and South 344th Street alternatives. If TDLE is constructed as proposed, the mainline track associated with these OMF alternatives would be built later in time. Impacts associated with construction of the mainline track are addressed within the build alternatives impacts discussion below. All other TDLE-related impacts are addressed in Chapter 4, Cumulative Effects Analysis.

As part of FWLE, Sound Transit is constructing the Kent/Des Moines Station, which would be in the OMF South study area for the Midway Landfill Alternative, and the Federal Way Downtown Station, which would be in the study area for the Preferred and South 344th Street alternatives. The neighborhoods surrounding these new light rail stations would likely experience changes from FWLE once it is operational, such as added transportation infrastructure, transit access, and associated development.

3.6.2.2 Long-Term Impacts

Impacts Common to All Build Alternatives

Permanent impacts associated with all OMF South build alternatives include residential and commercial property acquisitions and land use conversions. Sound Transit would provide relocation assistance to displaced property owners and renters, according to the federal Uniform Relocation Act. More information about relocations and relocation assistance can be found in Section 3.3, Acquisitions, Displacements, and Relocations. Parcels acquired for OMF South would be converted from their existing land uses, such as commercial and residential, to transportation-related land use and would have to be rezoned accordingly. These land use changes are detailed in Section 3.4, Land Use.

There would also be long-term impacts to visual character for residents and businesses near the OMF South sites and mainline tracks. All the build alternatives would add new buildings, at-grade and elevated light rail track, overhead catenary wires, at-grade parking lots and access roads, as well as tree and shrub landscape plantings and fences around the perimeter with limited-access gates. Elevated sections of mainline tracks and other elements of the site would be prominent and impact visual quality in neighborhoods in proximity to OMF South. These impacts are detailed in Section 3.7, Visual and Aesthetic Resources.

None of the build alternatives are anticipated to have adverse impacts on safety and security. OMF South security measures would be like other Sound Transit OMFs, including on-site security personnel, perimeter fencing, electronically controlled gates, and security patrol in the evenings. Additionally, the roadway, intersection, and nonmotorized improvements for all build alternatives would improve safety for motor vehicle and nonmotorized users in the study areas. Except for site driveways, OMF South would not intersect with existing roadways, highways, sidewalks, bicycle lanes, or nonmotorized trails. All tracks would be elevated over these transportation facilities, and site driveways would be designed to meet or exceed all local and state safety standards. See Section 3.2, Transportation, for more detailed safety information.

Preferred Alternative

The mainline tracks for the Preferred Alternative would affect Belmor, a manufactured home community on a parcel zoned multi-family residential, displacing approximately 71 to 77 mobile home lots. The 55 mph Design Option would displace more individual mobile homes than the 40 mph Alignment. Displacement of these mobile homes would likely adversely affect community cohesion within Belmor but would be unlikely to affect social cohesion in the surrounding neighborhoods of Steel Lake and Kitts Corner. Section 3.7, Visual and Aesthetic Resources, describes potential visual impacts to Belmor and the neighborhood to the south. Noise impacts from the 55 mph Design Option mainline tracks are expected at four residential properties under this alternative, although those impacts can be mitigated. See Section 3.9, Noise and Vibration, for more details.

Both the 40 mph Alignment and the 55 mph Design Option would permanently impact the private Belmor golf course. The 40 mph Alignment would modify the northeast corner of the course by relocating one golf hole and shortening its associated fairway. The golf course path in that area would also be altered but would serve the same function. The 55 mph Design Option would permanently affect a second hole and its associated fairway and further alter the cart path. However, its function would be maintained. The clubhouse would be unaffected.

The Preferred Alternative OMF site would permanently impact several social resources, including one religious facility. It would displace the Christian Faith Center church and its day care center (CF Kidz), along with the Pacific Christian Academy, which is a tenant on their property. The Christian Faith Center is a large-capacity church; therefore, it could be challenging to relocate a religious facility of this size and displacing it would impact the members of the service population from within and beyond the 0.5-mile study area. See Section 3.3, Acquisitions, Displacements, and Relocations, for further discussion.

The OMF site would also displace 15 residences, composed of one four-unit multi-family residential property and 10 single-family residential properties, one of which has two separate houses. Nine of these residences are adjacent to the I-5 right-of-way, between S 333rd Street and S 336th Street, where the lead tracks would connect to the mainline tracks. Residential displacements associated with the OMF site would not affect neighborhood quality because the properties are located on private drives and are relatively isolated. Additionally, the OMF site would displace 11 businesses, including a childcare center and commercial and light industrial businesses, such as an auto-repair shop, an aviation repair shop, home and business cleaning services, a gate design and fabrication company, a chiropractic center, and an equipment rental business. These businesses could likely be relocated without causing long-term impacts to community cohesion. Additionally, several of these businesses serve a broader area than the relatively narrow study area; therefore, their potential relocation out of the study area may not substantially affect their customer base.

South 344th Street Alternative

The South 344th Street Alternative would impact the most social resources and would have the most business and residential displacements as compared with the other build alternatives.

The mainline tracks for the South 344th Street Alternative would have identical impacts with respect to community cohesion and neighborhoods, including the potential impacts to the private Belmor golf course, as the Preferred Alternative mainline tracks.

The South 344th Street Alternative OMF site would displace approximately 20 residences and 17 businesses, including GarageTown and Ellenos Yogurt, which serve local populations and contain specialized facilities. GarageTown houses 67 individually rented or owned storage facilities and provides a community resource for tenants; however, impacts to community cohesion in the larger study area would be limited. Due to the unique site characteristics and large footprint, GarageTown may be challenging to relocate within the same area to continue to provide ease of access for its existing customer base.

The OMF site would also displace four religious facilities: Family Life Community Church, Voice of Hope Church, Redwood Church of God, and Tabernacle Temple of Praise. It is anticipated that these religious facilities could be relocated within the study area, if they cannot, the displacement of these religious facilities could affect community cohesion.

Midway Landfill Alternative

There would be no long-term impacts to social resources or community facilities within the Midway Landfill Alternative study area. The Midway Landfill Alternative would have the fewest impacts to social resources and community cohesion compared to other build alternatives.

For the Midway Landfill Alternative, all affected parcels and displacements are associated with the OMF site. The Midway Landfill Alternative OMF site would require relatively few property acquisitions that would affect social resources because it is primarily located on an existing landfill owned by the city of Seattle and managed by SPU. The OMF site would displace four businesses that, due to their size and type of business, are anticipated to be able to relocate within the study area without having long-term impacts to community cohesion. There are no residential displacements associated with the Midway Landfill Alternative.

3.6.2.3 Construction Impacts

Impacts Common to All Build Alternatives

Construction of a major project such as OMF South involves intensive activities that last several years. If the project is constructed near community resources and neighborhoods, community activities and cohesion could be affected. Construction associated with OMF South would include staging areas; reserves of building materials; temporary fencing; lighting; large vehicles such as cranes, dump trucks, bulldozers, and excavators; and temporary roads and/or detours of traffic lanes and sidewalks. Community resources and neighborhoods in proximity to these construction materials and activities would be impacted by temporary access and mobility restrictions and increased truck traffic; localized adverse impacts to air and visual quality; and increased noise and vibration. When construction is complete, properties and access would be restored as closely as possible to their previous conditions.

Preferred and South 344th Street Alternatives

In addition to those impacts described for all build alternatives, the Preferred and South 344th Street alternatives would have temporary construction impacts associated with the mainline tracks. Mainline track construction would temporarily affect the Belmor mobile home community and golf course. Increased traffic and proximity to construction activities would result in short-term effects on community cohesion within Belmor. In addition, a portion of the Federal Way/S 320th Street Park & Ride would serve as a construction staging area.

Midway Landfill Alternative

Construction of OMF South at the Midway Landfill Alternative would impact the Midway RV and Mobile Home Park, located along the landfill's northern boundary. While construction would not displace any mobile home units, it would require easement access through the mobile home park, resulting in increased traffic. This alternative would also have varying construction impacts associated with transportation, air quality, and noise, depending on which construction approach is considered.

The three subsurface construction design options — Platform, Hybrid, and Full Excavation — vary in the amount of excavation to prepare the site and the number of truck trips necessary to haul the material, as discussed in Section 3.2, Transportation. The daily truck trip volume for the Hybrid and Full Excavation subsurface construction design options would have greater impacts than the Platform subsurface construction design option on neighborhoods and social resources in proximity to the Midway Landfill Alternative from increased truck traffic, noise and vibration, and air quality impacts.

3.6.2.4 Avoidance and Minimization of Impacts

As part of the OMF South project, specific design features, BMPs, and mitigation measures would eliminate or minimize impacts to social resources, community facilities, and neighborhoods. These measures are described in detail in other sections of this Final EIS and are summarized below.

- Transportation (Section 3.2): There would be avoidance and minimization measures to address potential traffic congestion during construction, such as developing a traffic management plan and avoiding traffic disruptions during peak travel times.
- Acquisitions, Displacements, and Relocations (Section 3.3): Sound Transit's policies and procedures comply with federal, state, and local property acquisition and relocation policies and, in some cases, provide advisory services to property owners above the minimum requirements of federal and state law.
- Visual and Aesthetic Resources (Section 3.7): In areas adjacent to residents, where there is adequate space, Sound Transit would add on-site landscaping to help screen views of project components while ensuring safety and security. In areas adjacent to residences where not enough room exists for landscaping to screen views of retaining or noise walls, Sound Transit would treat the walls with visually interesting elements, such as design treatments that incorporate textures, patterns, color, or trellises with climbing vines.

- Noise and Vibration (Section 3.9): For the Preferred and South 344th Street alternatives, noise barriers are proposed for mitigation along the 55 mph Design Option elevated mainline tracks.

3.6.2.5 Indirect Impacts

Indirect impacts on social resources, community facilities, and neighborhood resources often relate to changes in land use or other changes that result in effects on the rate or pattern of development in an area. Because the proposed project would change land use by converting residential, vacant, and/or commercial/industrial land to a transportation use, there is the potential for indirect effects on neighborhood character from changes in development patterns.

3.6.3 Environmental Justice Summary

This Final EIS also includes an Environmental Justice Assessment (Appendix E), as required by Executive Orders 12898 and 14096, and Department of Transportation Order 5610.2C, the purpose of which is to seek to avoid disproportionate and adverse effects on minority and low-income populations, defined below:

- Minority populations include people who are Black, Hispanic, Asian American, American Indian or Alaskan Native, or Native Hawaiian and Other Pacific Islander (DOT Order 5610.2C, Appendix § 1(c)).
- Low-income populations include people whose median household income is less than or equal to two times the Federal Poverty Level — a local threshold that Sound Transit and other regional transit agencies have determined is appropriate for use in determining eligibility for reduced fare programs and reflects the increasingly high cost of living in the region.

Demographic information, including environmental populations, for the OMF South study area, surrounding jurisdictions, and Sound Transit district are included in Table 3.6-1 above.

The Environmental Justice Assessment follows guidance in FTA Circular C-4703.1 and addresses whether the OMF South alternatives would result in disproportionately adverse effects on minority and/or low-income populations and summarizes the public outreach to minority and low-income populations within the project area. The analysis also discusses the potential benefits of the project to minority and/or low-income populations, as well as the specific outreach efforts made during project development to involve these populations.

3.6.3.1 Project Impacts and Benefits

Project impacts with the most potential to affect environmental justice populations include displacement of residents, businesses, and community facilities, including religious facilities and childcare centers; visual impacts; and construction-related transportation impacts. These impacts are summarized below for each build alternative. Other long-term and construction-related project impacts would be avoided or would consist of minor impacts that could be mitigated. See Appendix E, Environmental Justice Assessment, for a more detailed discussion of impacts to environmental justice populations and proposed avoidance, minimization, and mitigation measures.

- Preferred Alternative: The Preferred Alternative would displace fewer residences, business, and social resources than the South 344th Street Alternative but more than the Midway Landfill Alternative. Most residential displacements would occur in Belmor, which is home to many retired and fixed-income residents, though they are not necessarily considered low-income. The Preferred Alternative would also displace the Christian Faith Center church and an associated daycare (CF Kidz) and the Pacific Christian Academy, each of which serves low-income and minority populations, and an in-home childcare center that offers programs in English and Somali and accepts subsidized payments. The mainline for the Preferred Alternative would cause adverse visual impacts for residents within Belmor and along 24th Avenue S.

- South 344th Street Alternative: The South 344th Street Alternative would displace the most residences, businesses, employees, and social resources. Similar to the Preferred Alternative, most residential displacements would occur in Belmor. The South 344th Street Alternative would also displace four religious facilities that offer services in multiple languages and serve minority populations. The mainline for the South 344th Street Alternative would cause adverse visual impacts for residents within Belmor and along 24th Avenue S.
- Midway Landfill Alternative: The Midway Landfill Alternative would have the fewest displacements, including no residential or social resource displacements. The extensive site preparation work required for the Midway Landfill Alternative would result in higher volumes of construction traffic for a longer duration, as compared with the other build alternatives, which would affect the adjacent residential community.

OMF South would support the system-wide expansion of Link light rail as called for in Sound Transit 3, including expansion into the south corridor from Federal Way to Tacoma. This would, in turn, improve regional connectivity and mobility and provide a reliable means of transportation for populations reliant on public transit, including low-income and minority populations. While all populations within the project's service area would realize these benefits to the same extent, they could accrue to a higher degree for minority and low-income residents as a primary and affordable means of transportation (American Public Transportation Association 2008; Center for Housing Policy 2006).

Other benefits include enhanced community connectivity for the Preferred Alternative through public space and a multi-use trail integrated into the site design, construction jobs with project labor agreements and a disadvantaged business enterprise program to support hiring minority populations, and the creation of new high-skilled, living-wage jobs to operate the facility. In addition, the increased purchase and sale of goods and services within the community to facilitate construction and the positive economic effects of construction workers' purchases in food and retail within the community could temporarily benefit businesses that are owned by environmental justice populations.

3.6.3.2 Community Engagement

As part of its public engagement efforts during the OMF South scoping period and 2021 SEPA Draft EIS process, Sound Transit conducted a preliminary demographic analysis to identify low-income, minority, and limited-English-proficiency populations. Based on this analysis, Sound Transit used specific strategies to reach those communities during public outreach. As the project moves forward, Sound Transit will continue to engage community leaders, jurisdictions, and social service providers to seek input, assess outreach methods, and identify additional ways to reach low-income, minority, and limited-English-proficiency populations.

3.6.3.3 Environmental Justice Determination

After consideration of the totality of the circumstances, including mitigation, offsetting direct and indirect benefits, and impacts, the net results of the project would not have disproportionate and adverse effects on minority and low-income populations as described under EO 12898, EO 14096, and DOT Order 5610.2C.

3.6.4 Mitigation Measures

In addition to the discipline-specific avoidance and minimization measures described above, no mitigation measures are anticipated.

3.7 Visual and Aesthetic Resources

This section documents the visual environment surrounding the OMF South project alternatives and assesses the extent to which the viewer experience of visual and aesthetic resources may be affected by the project. The analysis assesses the existing visual quality and character of the landscape and then considers how typical viewers may respond to what they see around them. Assessment methods include defining viewsheds from where a build alternative can potentially be seen, characterizing the visual quality in landscape units within the viewshed, and selecting key observation points of the affected areas.

Visual and aesthetic impacts are defined by the extent to which the proposed project would change the environment in terms of visual quality and viewer sensitivity. Sound Transit adapted FHWA and WSDOT guidelines for visual quality analysis, which refers to the evaluation of the visual experience of the public described in terms of vividness (distinctive and memorable views), intactness (consistent or contrasting elements within view), and unity (overall compositional harmony) and is ranked as high, medium, or low. Viewer sensitivity refers to how viewers perceive the environment and what they find important, and is also rated as high, medium, or low.

Landscape units are geographic units in which visual quality impacts to viewers are assessed, are defined both by viewshed area and landscape type, and are generally visually homogenous (i.e., one viewshed and one landscape type). Key observation points were selected within each landscape unit to illustrate views that are typical of the build alternatives, locations from where project features are particularly prominent, or views from sensitive viewpoints that would have views of the operating build alternative. At each key observation point, views of existing conditions are compared with simulated views of the build alternatives.

Please see Appendix H3, Visual and Aesthetic Resources Technical Appendix, for more detail about the methodology and terms used in this analysis.

3.7.1 Affected Environment

This section describes the affected environment for visual and aesthetic resources by landscape unit and by build alternative. There are three landscape units. The first landscape unit is the section of the I-5 corridor and adjacent areas where the mainline and test tracks serving the Preferred and South 344th Street alternatives would be built. The second landscape unit encompasses the OMF sites of the Preferred and South 344th Street alternatives. The third landscape unit encompasses the Midway Landfill Alternative. Table 3.7-1 below lists the landscape units and describes the visual quality rating and viewer groups for each.

Most views of the build alternatives are foreground views from vantages immediately adjacent to the sites and are typically within 400 to 500 feet. Views of the sites from beyond 500 feet and background vantages are mostly blocked by either vegetation, terrain, buildings, or infrastructure. Figures 3.7-1 through 3.7-4 show each build alternative, the associated landscape unit, and the location of the key observation points.

Table 3.7-1 Existing Visual Quality for the OMF South Alternatives

Alternative	Landscape Unit	Vividness	Intactness	Unity	Existing Visual Quality	Predominant Viewer Groups (Sensitivity)
Preferred	Mainline: Landscape Unit 1	Medium	Low to Medium	Medium	Medium	Residential (High) Woodbridge Corporate Park visitors (Medium-high) I-5 Commuting Drivers (Low) I-5 Sightseeing Drivers (High)
Preferred	Site: Landscape Unit 2	Low to Medium	Medium	Medium	Medium	Residential (High) I-5 and SR 99 Commuting Drivers (Low) I-5 and SR 99 Sightseeing Drivers (High) Business Patrons and Workers (Medium) Pedestrians and Cyclists (Medium)
South 344th Street	Mainline: Landscape Unit 1	Medium	Low to Medium	Medium	Medium	Residential (High) Woodbridge Corporate Park visitors (Medium-high) I-5 Drivers (Low) Sightseeing Drivers (High)
South 344th Street	Site: Landscape Unit 2	Low to Medium	Low to Medium	Low to Medium	Low to Medium	Residential (High) I-5 and SR 99 Commuting Drivers (Low) I-5 and SR 99 Sightseeing Drivers (High) Business Patrons and Workers (Medium) Pedestrians and Cyclists (Medium)
Midway Landfill	Site: Landscape Unit 3	Medium	Low to Medium	Low to Medium	Medium	Residential (High) I-5 and SR 99 Commuting Drivers (Low) I-5 and SR 99 Sightseeing Drivers (High) Business Patrons and Workers (Low to Medium) Pedestrians and Cyclists (Medium)

FIGURE 3.7-4
Visual Conditions and Key Observation Points
Midway Landfill Alternative

OMF South

3.7.1.1 Mainline Tracks

Landscape Unit 1 encompasses the mainline alignments that would connect the Preferred and South 344th Street alternatives to the terminus of FWLE, including the tail tracks and test track (Figure 3.7-1). This area is well south of and separate from the Midway Landfill Alternative and shares adjacency with the Preferred and the South 344th Street alternatives. However, the visual character of the mainline study area is unique and distinct from that of the OMF sites.

The northern portion of Landscape Unit 1 is near the future Federal Way Downtown Station and includes the Federal Way downtown area, the Federal Way Performing Arts Center, The Commons at Federal Way shopping center, and the Federal Way/S 320th Street Park & Ride. The central portion includes residential areas, including Belmor, a 63-acre mobile home park for adults 55 years and older that contains over 300 mobile home units and a nine-hole golf course located south of S 324th Street, and the visually prominent BPA transmission line towers. The southern portion of this area extends south of S 348th Street and includes the I-5/SR 18 interchange and a shopping center with big-box and medium-scale retail shops.

Belmor residents are high-sensitivity viewers. Relatively unobstructed views of Mount Rainier can be seen from locations in Belmor. The residents between Belmor and S 336th Street would have high visual sensitivity as well, with views of mature trees within and surrounding the neighborhood. The vividness and unity ratings of Landscape Unit 1 are medium, and intactness is rated low to medium.

I-5 runs adjacent to the proposed mainline. The mature vegetation along the edge of I-5 serves as a backdrop for many adjacent neighborhoods that, along with noise walls in some locations, provides a visual barrier to the freeway and provides natural beauty along the highway for the traveling public. Where I-5 can be seen from adjacent areas, its presence influences the character of adjacent land uses and the visual quality of surrounding areas.

The southern tail track alignments extend to S 348th Street at the I-5/SR 18 interchange. This area includes two WSDOT-designated RCAs and is bordered by the I-5/SR 18 interchange on the east and south and a retail store parking lot on the west (Figure 3.7-4). The northernmost of the two RCAs is approximately 0.3 acre and is covered in mature native trees. The second area, 500 feet to the south, is approximately 1 acre and is primarily covered in Himalayan blackberry, with just a few trees. Both are seen as a green background for travelers on I-5 and for visitors to the stores to the west.

Lighting within the landscape unit varies from the higher levels of commercial and streetscape lighting in the Federal Way Downtown area to more the subdued neighborhood lighting in Belmor to the I-5 corridor, which is continuously illuminated from high-mast overhead lighting.

3.7.1.2 Preferred Alternative

The Preferred Alternative is located within Landscape Unit 2, which encompasses the combined areas of the Preferred and South 344th Street alternative OMF sites and their surroundings. Landscape Unit 2 is defined by residential uses to the north, a commercial business district to the south, retail businesses and residential and light industrial land uses to the west, and I-5 to the east (Figure 3.7-2). The OMF site itself is bounded on the north by S 336th Street, with residential areas beyond, and to the east by the I-5 corridor, which is lined with mature conifer trees. The site is bounded on the west by SR 99 and commercial properties. To the south, the site borders S 340th Street and S 341st Place and a mix of warehouses, light industrial land uses, and residential properties.

The site is primarily occupied by the approximately 55-foot-tall building for the Christian Faith Center church, with surrounding surface-level parking west of 20th Avenue S, and overflow parking lots, a soccer field, and open areas east of 20th Avenue S. Given the mix of visual character elements of parking areas, landscaping, and more natural perimeter vegetation along with the building scale, the Christian Faith Center campus has medium visual intactness and unity. The southern portion of the site, with a mix of building forms, scales, and uses, has a lower level of unity and intactness. Overall views in the area lack vividness, and the overall visual quality is medium.

Lighting visible within the study area consists of exterior lighting for the Christian Faith Center parking areas; limited interior lighting and street lighting associated with residential areas to the north and commercial areas to the south of the site; and high-mast lighting on I-5 to the east of the site that is somewhat obscured by mature vegetation next to the interstate.

Viewers of the OMF site include nearby residents in surrounding neighborhoods; patrons and workers at nearby commercial and industrial establishments; motorists, pedestrians, and cyclists using nearby streets; and motorists driving on I-5.

3.7.1.3 South 344th Street Alternative

The South 344th Street Alternative partially overlaps with the Preferred Alternative within Landscape Unit 2 (Figure 3.7-3). A portion of the OMF site extends north to S 336th Street, with residential areas beyond, and to 20th Avenue S on the west, with the Christian Faith Center building and parking areas beyond. The entire site is bordered on the east by the I-5 corridor, which is lined on both sides with mature conifer trees, and the southern boundary of the site is defined by S 344th Street and commercial uses beyond. The majority of the proposed OMF site is south of the Christian Faith Center and includes two residential streets with approximately 20 residences. The remainder of the southern area is occupied with various office and warehouse light industrial buildings and associated surface-level parking, bounded on the west by warehouse and light industrial properties.

The northern portion of the site, which covers the Christian Faith Center campus property east of 20th Avenue S, is visually open and uncluttered and therefore has a medium level of intactness and unity. The main southern portion of the site contains a mix of building forms and uses and has a lower level of unity and intactness. Overall views in the area lack vividness, and the overall visual quality is medium to low.

As with the Preferred Alternative, lighting visible within the study area consists of exterior lighting for the Christian Faith Center parking areas and high-mast lighting on I-5 to the east. Due to its proximity to the commercial areas to the south, the South 344th Street Alternative is subject to higher lighting levels as compared to the Preferred Alternative.

Viewers of the OMF South alternative site include nearby residents in surrounding neighborhoods; patrons and workers at nearby commercial and industrial establishments; motorists, pedestrians, and cyclists using nearby streets; and motorists driving on I-5.

3.7.1.4 Midway Landfill Alternative

Within Landscape Unit 3, the Midway Landfill Alternative OMF site is bordered to the north by S 244th Street and the Midway RV and Mobile Home Park. I-5 borders the site on the east, with a continuous vegetative buffer east of the interstate screening views of the project site from residential neighborhoods to the east of I-5. To the south, the site is bordered by S 252nd Street, a residential neighborhood, and a large superstore to the southwest. SR 99 and automobile-dependent businesses with parking areas, including hotels, restaurants, auto mechanics, and other small commercial uses in strip mall developments, border the site to the west. Residential neighborhoods lie further west beyond the SR 99 commercial zone.

The site itself is a closed landfill and stands out as distinct from surrounding areas with an open, gently rolling landscape covered in tall grass. Gravel access roads and landfill gas collection piping crisscross the site, and a stormwater detention pond is located on the northern part of the property. Observed on its own, the site would be rated a higher visual quality, with uniform fields providing higher vividness, intactness, and unity and a different visual character from its surroundings, which are mainly developed. But as seen by most viewers, including the more sensitive residential viewers to the north and south, views include a mix of on-site and off-site built and natural elements that give the broader landscape unit medium vividness and low to medium visual intactness and unity.

Lighting within the study area consists of limited exterior lighting for the landfill operations area in the northwest corner of the site, lighting for businesses adjacent to and roadway lighting on SR 99, interior and exterior lighting and street lighting associated with residential areas to the north and south of the site, and high-mast lighting on I-5 to the east.

The view on both sides of I-5 within Landscape Unit 3 is of mature, mainly native mixed forest dominated by conifer trees with some open, tall grass areas, including the Midway Landfill. The view on the west side includes the FWLE mainline in places. For motorists and passengers traveling through the corridor, the vegetation and open grass areas provide for a pleasant backdrop with higher visual intactness and unity. The mature vegetation along the edge of I-5 serves as a backdrop for many adjacent neighborhoods that, along with noise walls in some locations, provides a visual barrier to the freeway. Where I-5 can be seen from adjacent areas, its presence influences the character of adjacent land uses and the visual quality of surrounding areas.

3.7.2 Environmental Impacts

3.7.2.1 No-Build Alternative

Under the No-Build Alternative, impacts to visual and aesthetic resources from construction or operation of OMF South would not occur. However, other planned projects would have impacts in the OMF South study areas. For example, the construction of the elevated mainline tracks associated with FWLE has affected visual resources in the Midway Landfill Alternative study area to the east of the landfill, next to I-5, and through removal of some mature vegetation that screens views of I-5 south of the landfill. In addition, the proposed build alignments for TDLE overlap with the OMF South Preferred and South 344th Street alternatives. If TDLE is constructed as proposed, the mainline track associated with these OMF alternatives would be built later in time. Impacts associated with construction of the mainline track are addressed within the build alternatives impacts discussion below. All other TDLE-related impacts are addressed in Chapter 4, Cumulative Effects Analysis.

3.7.2.2 Long-Term Impacts

This section qualitatively assesses the level of visual change and visual quality for each landscape unit that could occur as a result of OMF South, based on simulations that were prepared for this assessment. The simulations use photographs of existing views from key locations from around each build alternative and show proposed conceptual designs. Building, wall, and landscaping details would be determined in the final design phase.

Visual impacts are defined as a change from a higher visual quality to a lower visual quality where sensitive viewers have exposure to the view. The following criteria are used to characterize the degree of visual quality change from existing conditions in terms of changes in the elements of vividness, intactness, and unity.

- **High change and impact to visual quality** would remove existing features and/or introduce visually prominent features that alter the visual character of the area for sensitive viewers with exposure to the change. High visual change could have high, medium, or low visual impact, depending on the level of sensitivity and exposure of viewers effected.
- **Medium change and impact to visual quality** would alter visual features but not in a way that would be perceived as intrusive or incompatible by most viewers, and it would not substantially change intactness and visual unity. Medium visual change would have medium or low visual impact, depending on the level of sensitivity and exposure of viewers effected.
- **Low change and impact to visual quality** generally includes relatively minor new features or relatively minor alteration of existing features, such as vegetation cover. Low visual change would generally have low visual impact, depending on affected viewers.

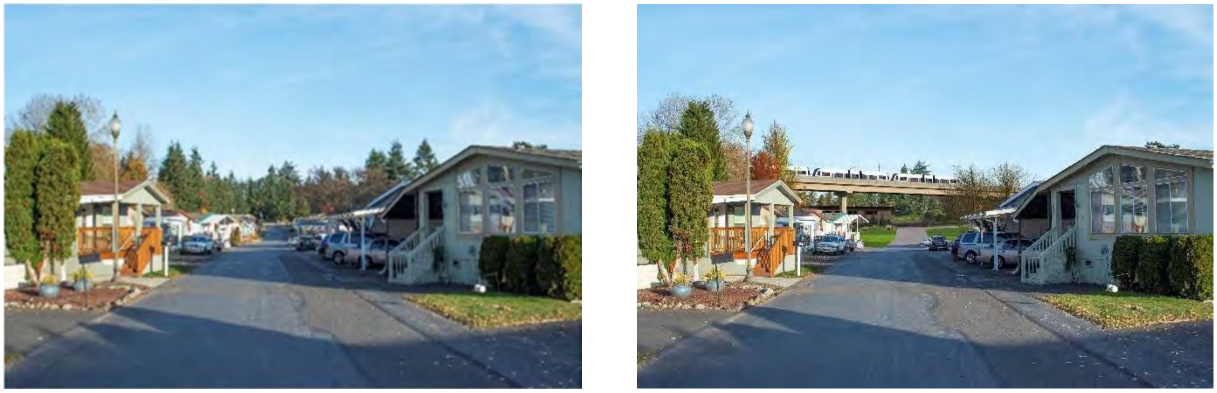
Impacts Common to All Build Alternatives

All the build alternatives would add new at-grade buildings, elevated light rail track, overhead catenary wires, at-grade parking lots and access roads, as well as tree and shrub landscape plantings and fences around the perimeter with limited-access gates. On-site lighting would be as prominent or more prominent than existing lighting at the alternative sites; however, light sources would be shielded to control glare and light escaping from the site.

Mainline Tracks

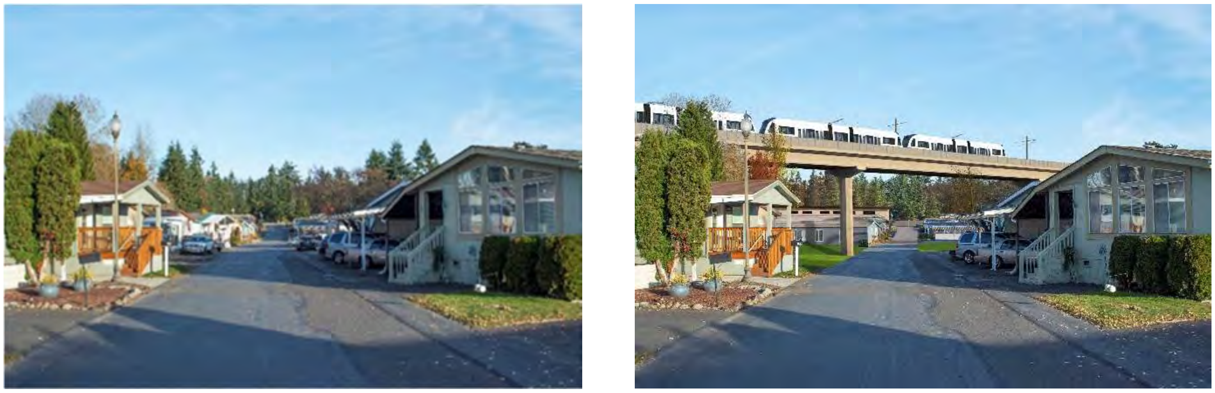
Viewers of the mainline and test tracks include residents at Belmor and residential neighborhoods to the south of Belmor (high-sensitivity viewers), sightseeing drivers on I-5 (high-sensitivity viewers), commuting drivers on I-5 (low-sensitivity viewers), and patrons and employees of businesses (low-sensitivity viewers). The test track would be at the same level as the mainline tracks and generally follow the same alignment. Figures 3.7-5 through 3.7-8 show visual simulations of the proposed facility from three key observation points along the mainline tracks.

Figure 3.7-5 represents the view Belmor residents would have of the 40 mph Alignment and 55 mph Design Option for the mainline tracks. The mainline and test tracks would connect to the Preferred and South 344th Street alternative OMF sites roughly 0.75 mile south of this location. The elevated mainline and test tracks would have a high impact on the visual intactness, unity, and vividness of this view for the high-sensitivity viewers at Belmor. Residents would have views of the elevated mainline and test tracks due to their height, with views of the test track facility east of the track. Plantings to screen views of the mainline would not be possible due to the clear zones required around the tracks.



Existing Condition

Simulation of Mainline with 40 mph Alignment

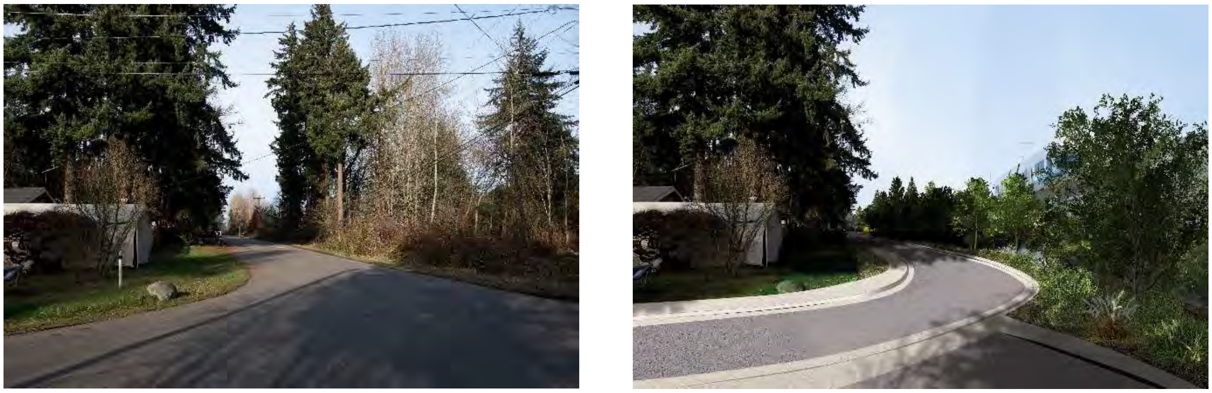


Existing Condition

Simulation of Mainline with 55 mph Design Option

Figure 3.7-5 Mainline Tracks Key Observation Point 1

Figure 3.7-6 shows the retaining wall supporting the mainline tracks looking north from the intersection of S 333rd Street and 24th Ave S. The existing mix of mature conifer and deciduous trees provide a naturalistic visual screen combined with an existing noise wall to block views of I-5. The clearing of vegetation and construction of walls for the elevated mainline and test tracks would have a high impact on the visual intactness of this view for high-sensitivity viewers west of 24th Ave S. Vegetation would be added to provide visual screening of the mainline in this area but would not fully obscure the mainline.

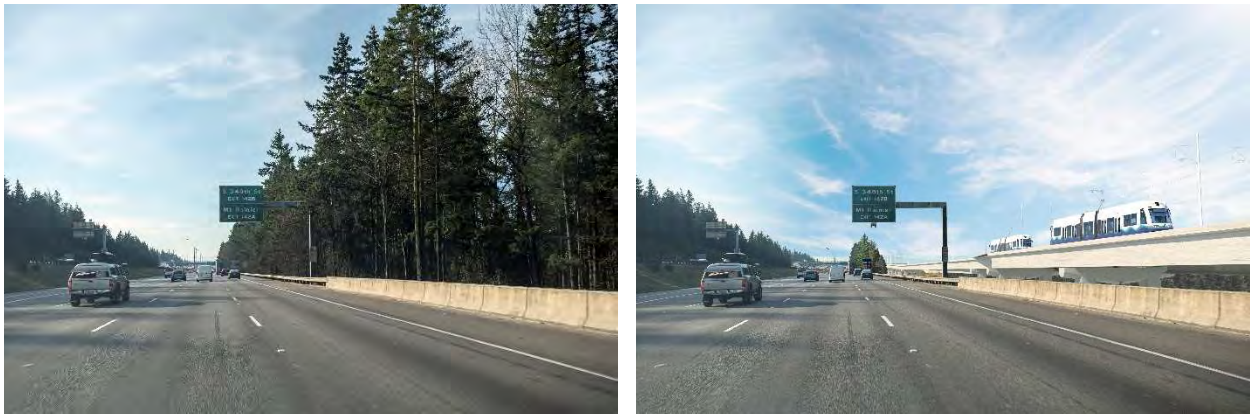


Existing Condition

Simulation of Proposed Conditions approximately 10 years after planting

Figure 3.7-6 Mainline Tracks Key Observation Point 2

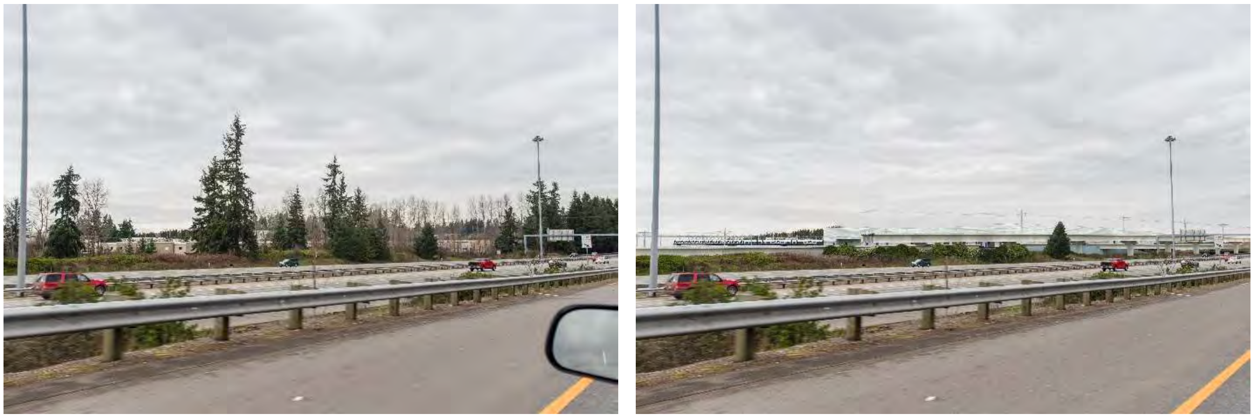
Figure 3.7-7 presents the driver viewpoint looking southwest on southbound I-5. The Preferred and South 344th Street Alternative OMF sites would be just out of sight to the right of this view, where the grade drops down west of the interstate. The mainline tracks would have a high impact on the visual intactness, unity, and vividness of this view for lower-sensitivity commuting viewers and high-sensitivity sightseeing viewers traveling I-5. The potential exists to retain vegetation west of the elevated mainline tracks in this view and to plant new trees along portions of the alignment; however, retained and new vegetation would not be very visible in this view because it would be on the opposite side and downslope from the mainline tracks.



Existing Condition *Simulation of Proposed Conditions*

Figure 3.7-7 Mainline Tracks Key Observation Point 3

Figure 3.7-8 captures the driver viewpoint looking northwest at the rendering of the mainline tracks and facility from the entrance ramp where westbound SR 18 merges onto northbound I-5. The South 344th Street Alternative OMF site is behind the trees on the other side of I-5. Building detail will be determined during the final design phase. This view looks directly toward two RCAs, some trees visible in this view would be impacted by the project. The project would have a low to medium impact on the visual intactness, unity, and vividness of this view for low-sensitivity commuting viewers and high-sensitivity viewers traveling I-5.



Existing Condition *Simulation of Proposed Conditions*

Figure 3.7-8 Mainline Tracks Key Observation Point 4

Summary of Mainline Track Impacts

Overall the mainline would result in a high impact to visual quality. Construction of the mainline would displace a number of mobile homes along the eastern portion of Belmor and require the removal of trees and vegetation within the clear zone of the tracks. The elevated mainline and test tracks would have a high impact for the high-sensitivity viewers at Belmor from their homes and when using the private golf course. Depending on final design clearing requirements, the mainline would also have a high impact for the high-sensitivity residential viewers living on the west side of 24th Avenue S and the residential communities between Belmor and the existing Christian Faith Center.

The removal of vegetation along I-5 for the mainline would have a lesser impact to high-sensitivity sightseeing travelers and lower-sensitivity commuters along I-5.

Preferred Alternative

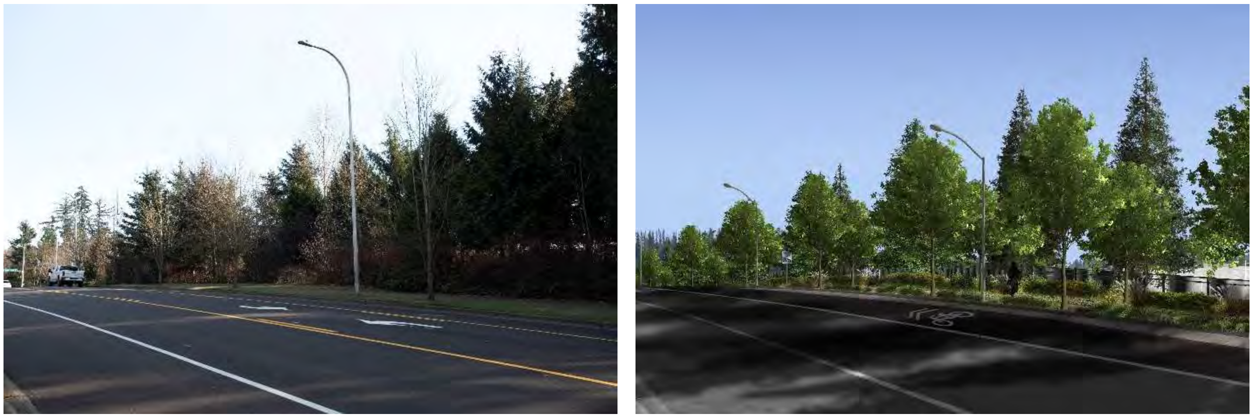
Viewers of the Preferred Alternative site include residents to the north of the site (high-sensitivity viewers), visitors to and employees of the Russian-Ukrainian Seventh-Day Adventist Church (medium-sensitivity viewers), sightseeing drivers on I-5 (high-sensitivity viewers), commuters on I-5 (low-sensitivity viewers), and patrons and employees of nearby businesses to the south and southwest of the site (low-sensitivity viewers).

The project would remove the landscaping in the parking areas for the Christian Faith Center and street trees and all landscaping along 20th Avenue S, as well as mature trees and much of the vegetation around the perimeter of the site. The north side of the site would have two existing driveways removed and replaced with a pathway and landscaped vegetation, trees, and other improvements along the roadway frontage. The current drive entry on SR 99 would be removed and replaced with landscaping. Mature trees and vegetation would be cleared in order to extend 18th Place S northward to connect to S 336th Street and extend 21st Avenue S southward to connect to S 344th Street. Residences, mature trees, and landscaping on the properties south of the Christian Faith Center would be removed to support future site improvements. Open space and fields east of 20th Avenue S would also be removed.

Lead tracks would be contained within the Preferred Alternative OMF site boundary, except for a small segment of track that would pass over S 336th Street to connect with mainline tracks near I-5. Lead tracks on the southern end of the site would also be mostly contained within the site boundary, with a small segment passing over vacant and industrial parcels. These changes would not lead to additional visual impacts beyond those listed above under Impacts Common to All Build Alternatives and Mainline Tracks. Additionally, one RCA in the study area would be impacted by the alignments for the mainline tail tracks in the area northwest of the I-5/SR 18 interchange (see Figure 3.7-1). The tail tracks would be built adjacent to the eastern boundary of the RCA, which could impact some vegetation.

Figures 3.7-9 through 3.7-11 show visual simulations of the proposed facility from three key observation points around the site. In general, visual impacts would be highest immediately following construction and, in areas where there is landscaping, would lessen over time as vegetation grows.

Figure 3.7-9 captures the view of the facility along S 336th Street, looking southeast from across the street. This represents the site as it would be seen by viewers in residences north of the site who would have a high sensitivity to change to this view. While existing trees and shrubs would be removed, new street trees and frontage improvements along the perimeter of the site and vegetation planted within the proposed site would grow over time and reduce impacts. Views of the storage tracks on the north end of the site would be screened by landscaping and frontage improvements along S 336th Street and the differing grades of roadway and site. OMF buildings would be in the center of the site and would not be prominent in views from S 336th Street. The result would be a medium impact to visual intactness and unity for views from this location.

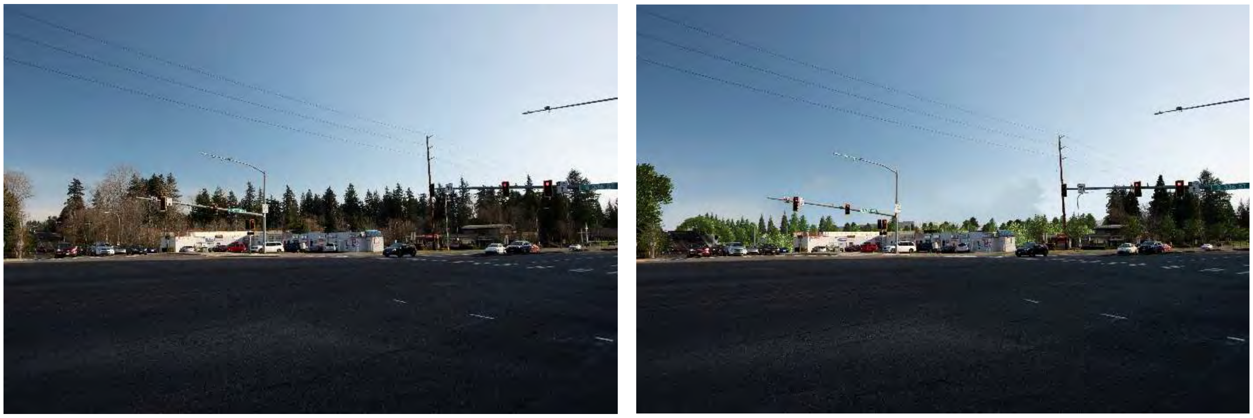


Existing Condition

Simulation of Proposed Conditions approximately 10 years after planting

Figure 3.7-9 Preferred Alternative Key Observation Point 1

Figure 3.7-10 shows a shared pedestrian and driver viewpoint looking southwest toward the site from the corner of SR 99 and S 336th Street. The removal of tall conifer trees will be apparent from this location; however, site development features, including the extension of 18th Place S, retaining walls, and buildings, will be partially obscured by existing vegetation. New street trees and site landscaping as seen from this view would, over time, grow and further screen views of the site development resulting in a low to medium visual change from this location for low to medium sensitivity viewers, who are mainly drivers and nonmotorized users along SR 99.

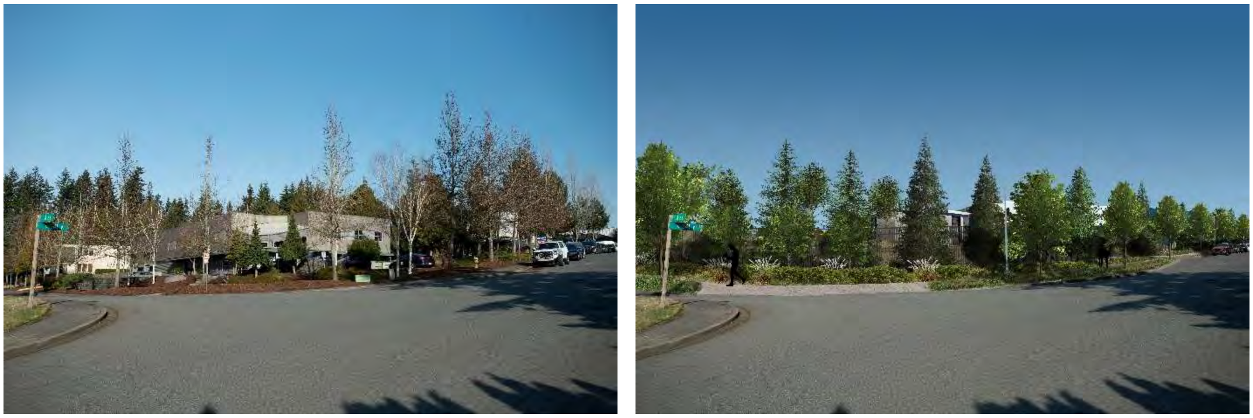


Existing Condition

Simulation of Proposed Conditions approximately 10 years after planting

Figure 3.7-10 Preferred Alternative Key Observation Point 2

Figure 3.7-11 represents the driver and pedestrian viewpoint looking northeast toward the entrance of the site from S 341st Street near the intersection with 18th Place S. Buildings and site development visible in this view would be similar in scale and character to existing commercial buildings. Streetscape and site landscaping would, over time, grow and screen site development to a similar degree as the existing trees and landscaping. Visual change would be minimal from this observation point for medium and higher sensitivity viewers.



Existing Condition

Simulation of Proposed Conditions approximately 10 years after planting

Figure 3.7-11 Preferred Alternative Key Observation Point 3

Summary of Preferred Alternative Impacts

Overall, the Preferred Alternative would result in a medium impact to visual quality. Visual features would be altered in a way that could be perceived as intrusive or incompatible for a medium change to visual quality and impact for higher-sensitivity residential viewers to the north. However, alterations to visual features to the south and west would not substantially change intactness and visual unity with surroundings and would largely maintain consistency with existing conditions.

The Preferred Alternative would also result in visual impacts associated with the mainline, as described above.

South 344th Street Alternative

Viewers of the South 344th Street Alternative include residents to the north (high-sensitivity viewers), visitors and employees of the Christian Faith Center and the Russian-Ukrainian Seventh-Day Adventist Church (medium-sensitivity viewers), sightseeing drivers on I-5 (high-sensitivity viewers), and commuters on I-5 (low-sensitivity viewers). Other viewers include residents of two properties directly west of the site (high-sensitivity viewers) and patrons and employees of businesses to the south and west of the proposed alternative site (low-sensitivity viewers).

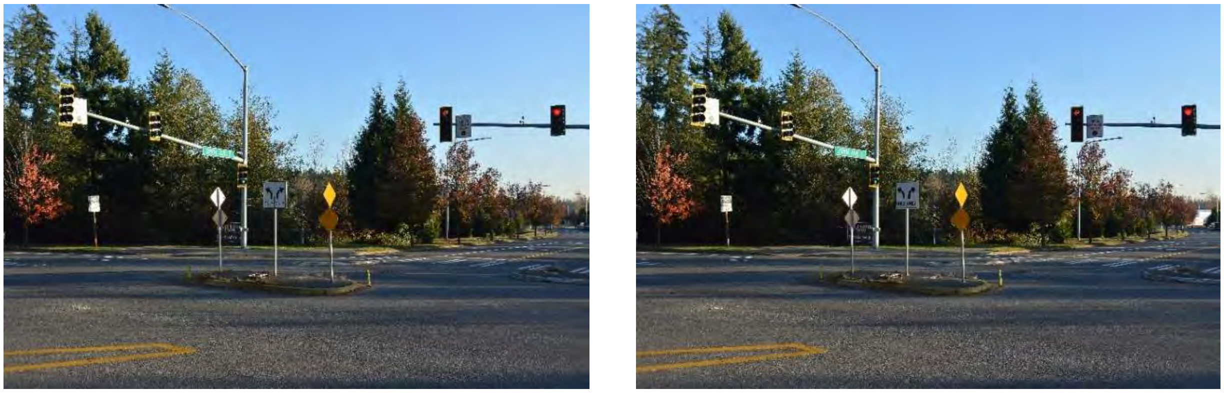
The visual impacts from the mainline and test tracks would be the same as those of the Preferred Alternative at the north end of the site. Additionally, the two RCAs in the study area would be impacted by either of the alignments for the mainline tail tracks in the area northwest of the I-5/SR 18 interchange (see Figure 3.7-1). The tail tracks would be built adjacent to the eastern boundary of the northernmost RCA, which could impact some vegetation, and pass directly through and partially impact the southernmost RCA.

Site development would result in a low degree of visual quality change compared with the existing commercial area, which has built elements and buildings of similar scale to those that surround the site to the south and southwest. Site development in the northern portion of the site would replace parking and open areas with new structures in proximity to residential viewers north of S 336th Street and to visitors and employees of the Christian Faith Center and the Russian-Ukrainian Seventh-Day Adventist Church. The increased scale of development in this area would result in a medium degree of change.

Lead tracks would be contained within the South 344th Street Alternative OMF site and would require clearing of some mature vegetation along I-5. Therefore, the OMF site would have visual impacts for low-sensitivity viewers from I-5 beyond those listed above under Impacts Common to All Build Alternatives.

Figures 3.7-12 through 3.7-15 show visual simulations of the proposed facility from three key observation points around the OMF site.

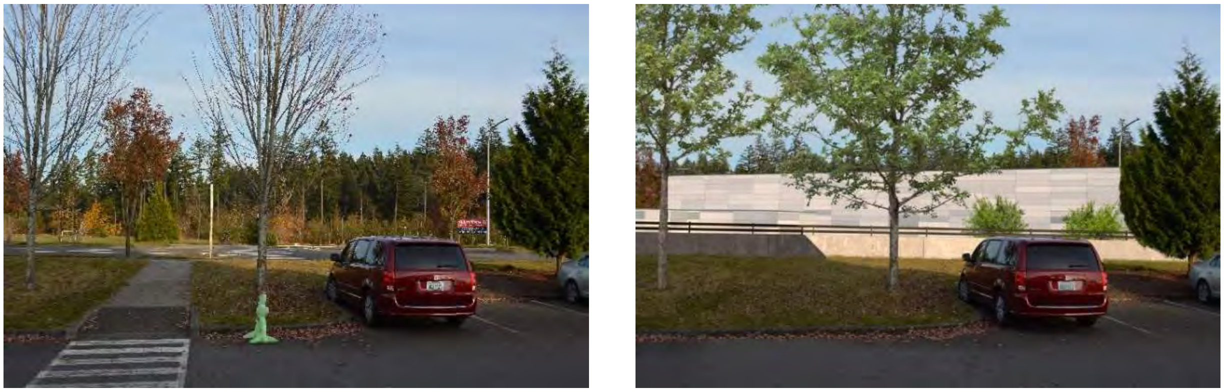
Figure 3.7-12 represents the driver viewpoint looking southeast from S 336th Street and 20th Avenue S from the opposite side of the street from the facility. This view represents the site as it would be seen by viewers in residences north of the site who would have a high sensitivity to change to this view. Architectural design and façade treatments on the buildings would reduce visual massing of those structures, and retention of existing or new vegetation planted around the site perimeter and nearer to the proposed on-site structures would screen and mitigate impacts to these views. Together this would result in a low impact to visual intactness and unity for views from this location.



Existing Condition *Simulation of Proposed Conditions*

Figure 3.7-12 South 344th Street Alternative Key Observation Point 1

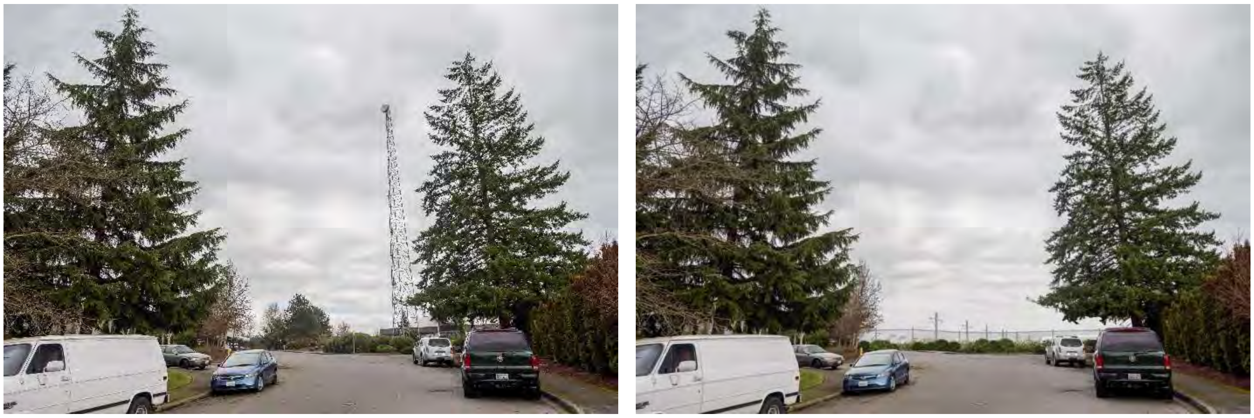
Figure 3.7-13 shows the pedestrian viewpoint of OMF South looking east from the east entrance to the Christian Faith Center. Views for congregants and employees of the Christian Faith Center would include new buildings and fencing. The presence of the proposed OMF buildings and fencing would result in a high degree of change in visual intactness, vividness, and unity for this view. However, new vegetation planted around the site perimeter and nearer to the proposed on-site structures would over time grow to screen and reduce impacts resulting in a medium to high visual impact for the medium sensitivity viewers at this location.



Existing Condition *Simulation of Proposed Conditions*

Figure 3.7-13 South 344th Street Alternative Key Observation Point 2

Figure 3.7-14 presents a rendering of OMF South looking east on S 341st Place from the driver viewpoint. Changes to the site entrance would result in low visual changes as seen by low- to medium-sensitivity viewers, who are mainly drivers and nonmotorized users along on S 341st Place.



Existing Condition *Simulation of Proposed Conditions*

Figure 3.7-14 South 344th Street Alternative Key Observation Point 3

Summary of South 344th Street Alternative Impacts

Overall, the South 344th Street Alternative would result in a medium impact to visual quality because of the increased scale of constructed features. The customers and employees (medium-sensitivity viewers) and residents (high-sensitivity viewers) next to the southern portion of the site would experience a low degree of change. The residents and church visitors to the north of the site would have views similar to what they have now, given that existing vegetation would be retained, and new trees and shrubs would be planted to provide a vegetative screen along S 336th Street. Views from the Christian Faith Center would include new buildings and fencing. Impacts to these views would be reduced over time with vegetative screening, such as the planting of trees and shrubs. Like the Preferred Alternative, views from I-5 under the South 344th Street Alternative would be affected by vegetation removal.

The South 344th Street Alternative would also result in visual impacts associated with the mainline, as described above.

Midway Landfill Alternative

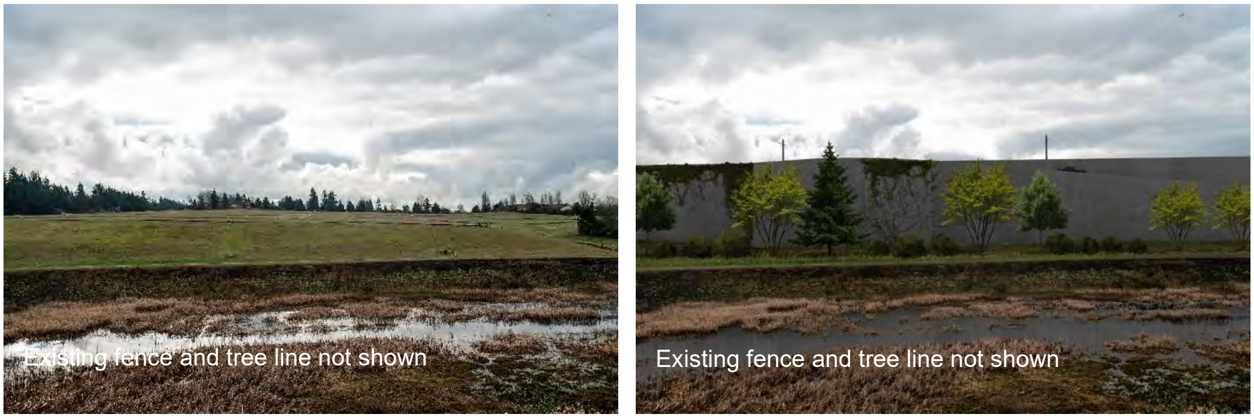
The primary viewers of the Midway Landfill Alternative OMF site include the residents in the neighborhood south of the site and residents of the Midway RV and Mobile Home Park north of the site (high-sensitivity viewers), sightseeing drivers (high-sensitivity viewers), and commuting drivers on I-5 and SR 99 (lower-sensitivity viewers). Other viewers include patrons and employees of businesses along SR 99, pedestrians, and cyclists — all of whom are considered to have medium or low viewer sensitivity.

The proposed facility would introduce prominent buildings and retaining wall structures. Retaining walls are needed to create the level areas required for operations on this sloping site. This would constitute a high degree of change when compared with existing conditions; however, the resulting development would not be drastically out of character with the visual character of the broader landscape unit east and west of the site.

Lead tracks would be seen by residential neighbors in the mobile home park to the north as well as by nearby residents in the neighborhood to the south. The lead tracks would appear somewhat closer to viewers than the mainline tracks. However, they would be at essentially the same elevations and, therefore, should not appear distinct or prominent separate from the mainline tracks.

Figures 3.7-15 through 3.7-18 show visual simulations of the proposed facility from four key observation points around the site.

Figure 3.7-15 provides an approximation of the residential view looking south from the Midway RV and Mobile Home Park across the stormwater detention pond to the OMF site. The photographer was unable to access the mobile home park, so this picture was taken from the northern edge of the landfill property. An existing fence and tree line that separate the landfill and the mobile home park are not visible because they are located directly behind the photographer in this view.



Existing fence and tree line not shown
Existing fence and tree line not shown

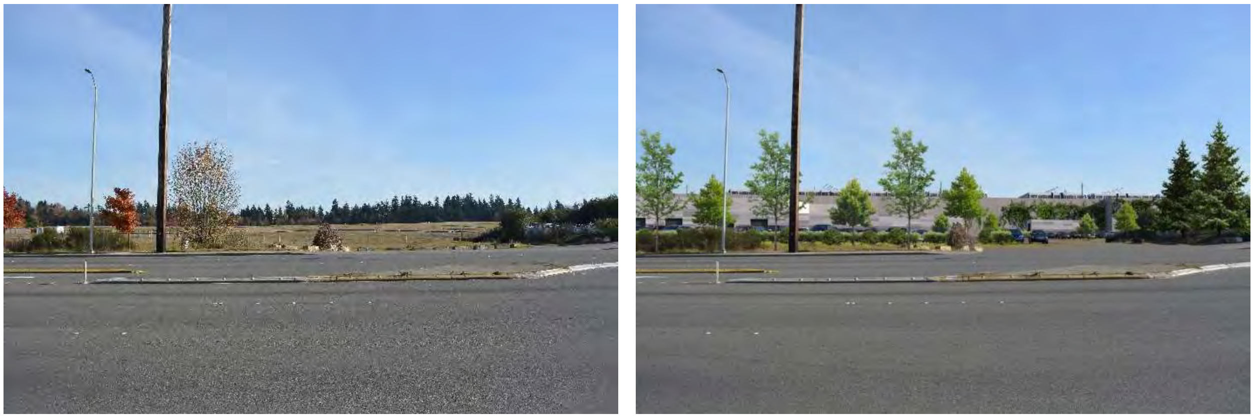
Existing Condition

Simulation of Proposed Conditions

Figure 3.7-15 Midway Landfill Alternative Key Observation Point 1

The residential viewers to the north of the site would have a high sensitivity to changes, and the proposed retaining walls for the site development would result in a medium to high degree of change to visual intactness, vividness, and unity in this view. However, the retention of the existing fence and vegetation along the property boundary would provide foreground visual screening. New landscaping around the site perimeter and near the proposed on-site structures would further screen and mitigate impacts to these views. Viewers would be over 300 feet from the wall, which would lower the wall's visual prominence. Together this would result in a low to medium visual impact for views from this location.

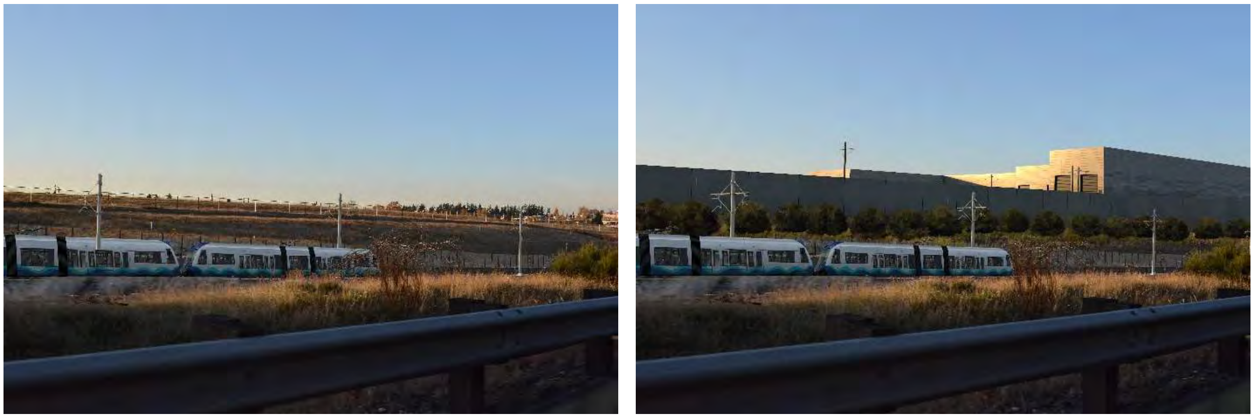
Figure 3.7-16 presents the pedestrian and driver views of the facility and wall from the corner of S 248th Street and SR 99, looking east. Views of the site from SR 99 by low- to medium-sensitivity viewers are the most prominent due to the lack of vegetation. The proposed retaining walls and visible elements beyond would result in a medium to high degree of change to visual intactness and unity in this view. Views of the wall seen in the simulation would be enhanced with aesthetic treatments to the wall surface as well as with tree and shrub plantings to screen the view of the wall. This would result in a low to medium level of impact.



Existing Condition *Simulation of Proposed Conditions*

Figure 3.7-16 Midway Landfill Alternative Key Observation Point 2

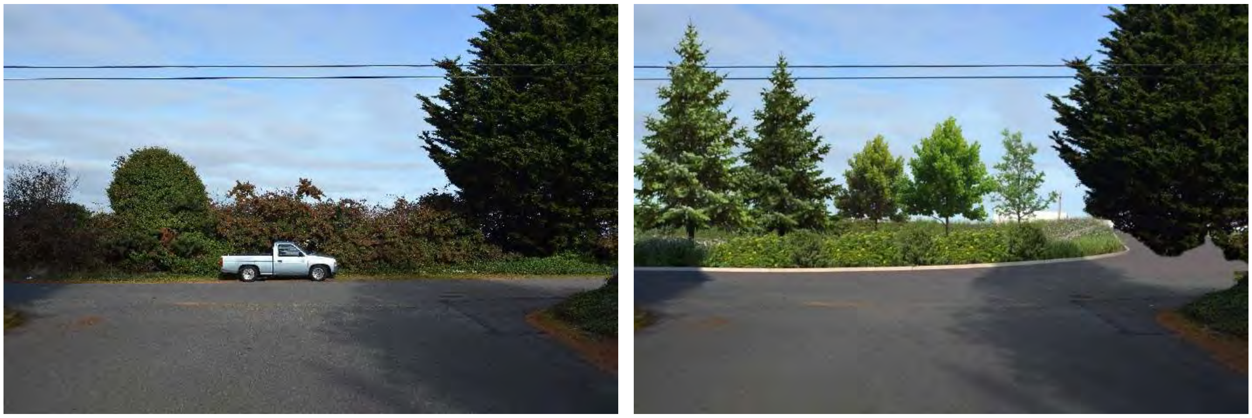
Figure 3.7-17 represents the facility building and wall that a driver would see looking northwest as they drive northbound on I-5. Travelers on I-5, which include both lower-sensitivity commuting viewers and high-sensitivity sightseeing viewers, would experience a medium to high degree of change to visual intactness and unity in this view. Visual change may be tempered somewhat by the presence of the FWLE mainline tracks in the foreground.



Existing Condition *Simulation of Proposed Conditions*

Figure 3.7-17 Midway Landfill Alternative Key Observation Point 3

Figure 3.7-18 shows the view from the closest houses in the residential neighborhood just south of the Midway Landfill. This photo was taken in the middle of S 252nd Street, at the intersection of 30th Avenue S, looking north. Residential viewers to the south of the site would have a high sensitivity to changes. But retention of some existing screening vegetation and planting of new screening vegetation would mitigate visual impacts from changes to the site perimeter adjacent to the residents as well as from the OMF buildings that would be over 500 feet in the distance. This would result in a low to medium visual impact to visual intactness and unity for these areas. Shielding of light sources would be used to control glare and light escaping from the site.



Existing Condition *Simulation of Proposed Conditions*

Figure 3.7-18 Midway Landfill Alternative Key Observation Point 4

Summary of Midway Landfill Alternative Impacts

Overall, the Midway Landfill Alternative would result in a medium impact to visual quality. Visual features would be altered in a way that could be perceived as intrusive or incompatible by higher-sensitivity residential viewers to the north and south, but they would not substantially change intactness and visual unity with surroundings as seen by the lower-sensitivity viewers to the west along SR 99. The preservation of existing vegetative screening in combination with the planting of new trees and shrubs would cause the residents to the north and south of the site (as sensitive viewers) to have similar views of the Midway Landfill Alternative as before the project. The views from I-5 of the Midway Landfill Alternative would affect both lower-sensitivity commuting viewers and high-sensitivity sightseeing viewers but would be somewhat obscured by the FWLE mainline tracks in the foreground.

3.7.2.3 Construction Impacts

There would be temporary visual impacts due to construction for the viewer groups identified for each build alternative. Construction would last approximately 3.5 years for the Preferred and South 344th Street alternatives and up to approximately 8.5 years for the Midway Landfill Alternative. While visual impacts from construction of the Midway Landfill Alternative would potentially be longer in duration, the nature of the impacts would be the same as for the other sites. The existing visual character and form of the site would be altered due to the removal of existing structures; vegetation, including trees and shrubs; and roads.

The construction site would include staging areas; reserves of building materials; fencing; lighting; large vehicles or pieces of equipment, such as cranes, dump trucks, scaffolding, bulldozers, or excavators; and detours or temporary roads. Other large vehicles could move to and from the site. The visual impact of construction would be a temporary decrease in visual quality, typical for a large construction project. Where practical, Sound Transit would place construction screens or barriers to limit the visibility of work areas from sensitive viewers, such as nearby residents. If necessary, Sound Transit would reduce the glare during nighttime construction by shielding light sources.

3.7.2.4 Avoidance and Minimization of Impacts

When developing the OMF South build alternatives during conceptual design, Sound Transit worked to minimize the elevation or height of structures to avoid and minimize potential visual impacts, including incorporating at-grade track profiles where practicable. Early conceptual design also considered where mainline track alignments could avoid or reduce acquisitions and clearing of right-of-way where the project would be near or in existing arterial and highway rights-of-way or utility corridors.

Each alternative site's context varies with the surrounding community, with the influence of comprehensive plans and zoning, and with development standards that govern building setbacks, heights and massing, landscaping, facade treatment, and urban design character. The project designers would consider site context and adhere to the landscape guidelines in Sound Transit's Design Criteria Manual. Context-sensitive design measures would be developed and refined during final design with input from the affected communities and cities and could include the following items:

- Preservation of existing vegetation and addition of new vegetation and street frontage improvements, where possible.
- Adherence to required design standards, guidelines, and design review processes for Federal Way, Kent, and WSDOT, as applicable, to promote visual unity in treatments at the site and along corridors. Landscaping treatments would be used to enhance the visual character of the build alternative at the perimeter of the site. Streetscape elements, such as sidewalks, street trees, and other aesthetic features, would be added along adjacent frontage streets. These measures would help maintain the local character, improve aesthetics, and reduce the visual scale of the proposed project.
- Architectural treatment of buildings, including varying materials and articulation of the building façade to minimize visual massing, provide visual interest, and reduce scale, in accordance with the Federal Way Revised Code.
- Design treatment of retaining walls, such as texture, pattern, color, and screening vegetation, where practical.
- Preparation of a Roadside Master Plan in accordance with WSDOT guidelines for the portion of the route within I-5 right-of-way and RCAs.
- Design of exterior lighting at the OMF site to minimize height and use of source shielding to avoid direct visibility of luminaires (bulbs) from residential areas, streets, and highways. Shielding would also limit spillover light and glare in residential areas.
- Replacement of trees removed for the project in accordance with tree-replacement requirements for Federal Way, Kent, and WSDOT to meet minimum replacement ratios. Some of these requirements encourage native species for the ecosystem benefit and the planting of younger trees because of the higher likelihood for survival as compared with transplanting more mature, larger trees.

It is important to note that, even when using larger or faster-growing trees or plants, it can take 15 to 20 years for the plants to grow large enough to screen large facilities such as elevated structures, buildings, or retaining walls. As a result, some visual impacts may not be able to be immediately avoided or minimized.

3.7.2.5 Indirect Impacts

No indirect impacts related to visual and aesthetic resources would result from construction and operation of the proposed project.

3.7.3 Mitigation Measures

In addition to the avoidance and minimization measures considered during the development of the design and in place during construction, mitigation measures would be implemented in areas near residences and other areas with sensitive viewers, where appropriate, to reduce impacts. Where possible, Sound Transit would place construction screens and/or barriers to limit the visibility of work areas where they are adjacent to visually sensitive receivers.

Sound Transit would refine the mitigation measures as the project design is further developed and feedback from reviewing agencies and the public is received. Most of the potential mitigation measures for visual impacts are related to the use of landscaping, berms, and aesthetic treatments to help screen views of the mainline and test tracks, OMF site, or other project components. Mitigation measures would be compatible with Sound Transit's maintenance and operations requirements, which include long-term maintenance, safety, and security considerations.

Depending on the alternative selected, mitigation measures would include the following:

1. In areas adjacent to residents, where there is adequate space, add on-site landscaping adjacent to residential areas to help screen views of project components while ensuring safety and security.
2. In areas adjacent to residences where not enough room exists for landscaping to screen views of retaining or noise walls, or in addition to landscaping under Mitigation Measure 1, Sound Transit would treat the walls with visually interesting elements, such as design treatments that incorporate textures, patterns, color, or climbing vines.
3. Within the WSDOT right-of-way, Sound Transit would consult with WSDOT to develop appropriate site-specific measures for roadside vegetated areas and mitigate the conversion of these areas to right-of-way with replacement property or with other measures agreed to by WSDOT and FHWA, consistent with the WSDOT Roadside Policy Manual (WSDOT 2022). The manual describes the extent of mitigation required for lost vegetation, vegetation types, and tree replacement ratios, including irrigation requirements and plant establishment criteria. Replacement parcels would meet the intended function of the original RCA.

Table 3.7-2 shows the primary locations where impacts would be mitigated for higher sensitivity viewers, depending on the alternative selected:

Table 3.7-2 Mitigation for Impacts to Visual and Aesthetic Resources

Landscape Unit and Alternative	Location	Mitigation Measure(s)	Notes
Landscape Unit 1, Mainline, Preferred and South 344th Street Alternatives	West side of the mainline through Belmor	Mitigation Measure 1 Mitigation Measure 2	Mitigation Measure 1 would add, where possible, trees and vegetation adjacent to the mainline and between columns to help screen views of the tracks for sensitive viewers within the Belmor residential area. In addition to Mitigation Measure 1, Mitigation Measure 2 would incorporate architectural treatments to project components such as walls and fencing to help soften views and add visual interest. Landscaping and architectural treatment would be designed to add human scale elements.
Landscape Unit 1, Mainline, Preferred and South 344th Street Alternatives	West side of the mainline along 24th Avenue S	Mitigation Measure 1 Mitigation Measure 2	These measures would add new vegetation to provide screening, where possible, or architectural treatments to walls to soften views and add visual interest. Both measures address the loss of vegetation and the introduction of guideway retaining walls for sensitive viewers living along 24th Avenue S. Landscaping an architectural treatment would be designed to add human scale elements.
Landscape Unit 1, Mainline, Preferred and South 344th Street Alternatives	Within WSDOT right-of-way adjacent to I-5	Mitigation Measure 3	This measure would mitigate the loss of vegetation in WSDOT right-of-way.
Landscape Unit 1, Mainline, Preferred and South 344th Street Alternative	RCAs adjacent to I-5	Mitigation Measure 3	Sound Transit would consult with WSDOT staff to develop appropriate site-specific and off-site mitigation measures to address impacts to RCA areas.
Landscape Unit 2, Preferred Alternative	Along South 336th Street adjacent to OMF South site	Mitigation Measure 1	This measure would add trees and other vegetation to provide screening to address the loss of mature trees and the introduction of OMF site buildings and structures for sensitive residential viewers on the north side of S 336th Street.
Landscape Unit 2, South 344th Street Alternative	OMF site frontage west of Christian Faith Center	Mitigation Measure 1	This measure would add new trees and other vegetation to address vegetation loss and introduction of OMF site buildings and fencing for sensitive viewers at the church.
Landscape Unit 3, Midway Landfill Alternative	Within northern portion of the site, surrounding buildings	Mitigation Measure 1	This measure would enhance the screening of OMF buildings for sensitive residential viewers to the north of the site.
Landscape Unit 3, Midway Landfill Alternative	Along southern border of OMF site	Mitigation Measure 1	This measure would enhance screening of OMF buildings for sensitive residential viewers to the south of the site.

3.8 Air Quality and Greenhouse Gas Emissions

This section discusses the potential air quality and greenhouse gas (GHG)-related impacts associated with the construction and operation of the OMF South project alternatives.

Regional impacts on air quality would be caused by criteria air pollutants that would be emitted directly or indirectly as a result of the proposed project. “Criteria air pollutants” are six common air pollutants that can harm health and the environment, cause property damage, and are subject to certain federal air quality standards known as the National Ambient Air Quality Standards (NAAQS). Three agencies have jurisdiction over the ambient air quality in the OMF South study area: EPA, the Washington State Department of Ecology (Ecology), and the Puget Sound Clean Air Agency.

The impacts of the OMF South project’s air quality and GHG emissions are not limited to the build alternative sites. Therefore, the study area for this analysis is the Puget Sound Clean Air Agency’s jurisdiction, which includes King, Pierce, Snohomish, and Kitsap counties.

Please see Appendix H4, Air Quality and Greenhouse Gas Technical Appendix, for more information on the regulatory requirements for air quality, including the NAAQS and efforts by Washington State and Sound Transit to reduce GHG emissions.

3.8.1 Affected Environment

3.8.1.1 Climate Conditions and Local Air Quality

Washington is located on a windward coast in the mid-latitudes, producing a predominantly marine-type climate west of the Cascade Mountains. East of the Cascades, the climate possesses both continental and marine characteristics. The Puget Sound region’s climate is mild, with wet and cloudy winters and cool and comparatively dry summers. In the interior valleys, measurable rainfall is recorded on 150 days each year; in the mountains and along the coast, there is rain 190 days each year.

Prevailing winds are typically from the south or southwest during the winter and from the north or northeast during the summer. Wind speeds are generally sufficient to disperse air pollutants released into the atmosphere. Air pollution is most noticeable in the late fall and winter under conditions of clear skies and light winds.

Typical air pollution sources near the study area include vehicular traffic, commercial and retail businesses, light industry, and residential wood-burning devices. While many types of pollutant sources are present, the largest contributors of criteria pollutant emissions are on-road vehicles, which contribute the majority of the carbon monoxide and ozone precursors. Secondary sources of emissions are commercial and industrial land uses.

Based on monitoring information for criteria air pollutants collected over a period of years, Ecology and EPA designate regions as being attainment or nonattainment areas for the criteria pollutants. Once a nonattainment area achieves compliance with the NAAQS, the area is considered an air quality maintenance area. Although portions of the Puget Sound region are in maintenance areas for $PM_{2.5}$ and PM_{10}, none of the build alternatives are located within nonattainment or maintenance areas.

According to Puget Sound Clean Air Agency's annual Air Quality Data Summaries (PSCAA 2023), air quality in the study area is good, and there is no part of the study area that is currently under non-attainment or maintenance. The criteria air pollutants of carbon monoxide, sulfur dioxide, nitrous oxide, and lead are all below the NAAQS (EPA 2023a).

While also below the NAAQS, the two pollutants that pose the greatest issue in the study area are particulate matter ($PM_{2.5}$) and ozone (O_3). The standards set by EPA are 9 micrograms per cubic meter ($\mu g/m^3$) for the $PM_{2.5}$ annual concentration, 35 $\mu g/m^3$ for the $PM_{2.5}$ 24-hour concentration, and 0.070 parts per million (ppm) for the O_3 8-hour concentration.[3] The following tables list the readings from the closest monitoring stations to the site alternatives from 2019 to 2022 (2020 is not included because readings were not taken consistently through the year due to the COVID-19 pandemic). As demonstrated in Tables 3.8-1 and 3.8-2, the air quality values for $PM_{2.5}$ and O_3 are below the NAAQS.

Table 3.8-1 $PM_{2.5}$ Monitoring results at Beacon Hill, Kent, and Auburn Monitoring Stations (micrograms per cubic meter)

Station	Value	NAAQS Level ($\mu g/m^3$)	Results by Year ($\mu g/m^3$)		
			2019	2021	2022[1]
Beacon Hill	24-hour[2]	35	11.9	11.8	27.7
	Annual Mean	9	5.2	4.4	7.0
Kent	24-hour[2]	35	17.8	17.6	33.7
	Annual Mean	9	5.8	7.1	9.3
Auburn	24-hour[2]	35	16.9	NA[3]	29.8
	Annual Mean	9	5.6	NA[3]	8.9

Source: PSCAA Air Quality Data Summaries for 2019, 2021, and 2022. Available at: https://pscleanair.gov/615/Data-Summary.

Notes:

(1) The relatively high readings for 2022 are attributable to the number of wildfires that year.

(2) 98th percentile 24-hour value averaged over 3 years

(3) Annual averages are reported only if 75 percent or more of the data for each of the four quarters is available.

Table 3.8-2 Ozone Monitoring Results at Beacon Hill Monitoring Station (parts per million)

Years	NAAQS Level (ppm)	Ozone concentration (ppm)[1]
2017 – 2019	0.070	.046
2019 – 2021	0.070	.050
2020 – 2022	0.070	.050

Notes:

(1) 3-year average of the annual 4th Highest Daily Volume.

Diesel exhaust is a known source of particulate emissions. While there is currently no known direct monitoring method to track diesel emissions, they, along with wood smoke particulates, are known to present the greatest potential health risk in the Puget Sound area (PSCAA 2023). Diesel exhaust also contains volatile organic compounds and nitrogen oxides, which can undergo chemical reactions in the atmosphere and become ozone (smog). Typical construction equipment powered by diesel engines includes bulldozers, excavators, backhoes, and loaders.

---

[3] EPA revised the standard for $PM_{2.5}$ annual concentration, effective February 7, 2024; it was formerly 12 $\mu g/m^3$.

There are several sensitive receptors in the project study areas, including single-family and multi-family residences and religious facilities. The study area around the Preferred Alternative includes a residential community with a mix of single- and multi-family residences and the Russian-Ukrainian Seventh-Day Adventist Church to the north. To the south is a mix of commercial uses with residences along 18th Place S and four churches south of S 341st Street: the Voice of Hope Church, Family Life Community Church, the Redwood Church of God, and Tabernacle Temple of Praise. To the west are commercial uses on both sides of SR 99, along with the KAC Baptist Church. I-5 is to the east.

The study area around the South 344th Street Alternative includes a mix of commercial, institutional, and residential land uses. To the north of the OMF site is a residential community with a mix of single- and multi-family residences, the Christian Faith Center and associated school, the Russian-Ukrainian Seventh-Day Adventist Church, and the KAC Baptist Church. To the south are commercial uses. To the west are commercial uses on both sides of SR 99. I-5 is to the east.

The land use around the Midway Landfill Alternative includes primarily commercial land uses to the west on both sides of SR 99, along with three churches: the Great Commission Presbyterian Church, the New Jerusalem Haitian Baptist Church, and the Seattle Full Gospel Church. Sensitive uses also include a mobile home park to the north and hotels and a single-family residential community to the south.

EJScreen (EPA 2024a) is an environmental justice screening and mapping tool developed by EPA to provide a nationally consistent dataset and approach for combining environmental and socioeconomic indicators. The EJScreen analysis conducted for OMF South indicates environmental justice indexes above the 90th percentile for diesel particulate matter, air toxics cancer risk, and air toxics respiratory hazard at each of the build alternative study areas. For the Preferred Alternative study area, the index is above the 80th percentile for particulate matter. The Washington State Health Disparities map (DOH 2022) indicates a similar ranking with the census tracts that contain the build alternatives, both ranking a 9 (on a scale of 1 to 10 with 10 being the highest) for Environmental Exposures.

3.8.2 Environmental Impacts

3.8.2.1 No-Build Alternative

Under the No-Build Alternative, impacts to air quality and GHGs from construction or operation of OMF South would not occur. Other planned projects in the area would have varying air quality and GHG impacts, depending on their nature. This includes TDLE, which overlaps with the OMF South Preferred and South 344th Street alternatives. If TDLE is constructed as proposed, the mainline track associated with these OMF alternatives would be built later in time. Impacts associated with construction of the mainline track are addressed within the build alternatives impacts discussion below. All other TDLE-related impacts are addressed in Chapter 4, Cumulative Effects Analysis.

The No-Build Alternative includes both private and public projects for which quantifiable GHG emissions data is not yet available. As a result, Sound Transit conducted a qualitative analysis of regional GHG emissions proportionate to the anticipated emissions from construction and operation of OMF South. King, Kitsap, Pierce, and Snohomish counties, the four counties within PSRC jurisdiction, have been experiencing an increase in GHG emissions over the past several years along with population and economic growth. In 2019 the four counties generated an estimated 48 million $MTCO_2e$ (King County 2023). Consistent with the GHG emission reduction goals of PSCAA, PSRC has a target to reduce GHG emissions to 50 percent below 1990 levels by 2030 and to 80 percent below 1990 levels by 2050 (PSRC 2020). Although GHG emissions within the PSRC region are anticipated to decline to 25.6 million $MTCO_2e$ by 2042 due to a number of recently enacted federal, state, and local policies, the counties are not on track to meet their GHG emission reduction goals (King County 2023).

Sound Transit also considered the social cost of GHG emissions, which is an estimate of the monetary value of the net harm to society associated with emission of carbon dioxide, methane, nitrous oxide, or other GHGs in a given year that contribute to climate change (EPA 2023b). As described above, the No-Build Alternative would have no construction- or operations-related GHG emissions for OMF South. Other planned projects under the No-Build Alternative would affect GHG emissions differently and therefore result in varying social costs of those emissions.

3.8.2.2 Long-Term Impacts

Impacts Common to All Build Alternatives

Because all the build alternatives would have the same programming and function, there are no discernable differences between them in terms of potential long-term air quality impacts. As such, the description of impacts below applies to all OMF South build alternatives.

Air Quality

Operational air quality emissions include emissions from mobile sources associated with the facility, natural gas usage, electricity usage, architectural coatings, consumer products, and landscaping equipment. Because electrical utilities in the project area primarily rely on hydropower and thus have very low emissions, the primary sources of long-term air quality emissions would be associated with employee commutes, material deliveries, and on-site vehicle maintenance, which includes the use of an enclosed paint booth. Spray painting would occur infrequently and be limited in quantity. Welding would also occur in a dedicated space with the proper ventilation systems. These functions would be placed in the interior of the site. The potential impacts from painting and welding would be minor and addressed by implementing standard minimization measures.

Because the build alternatives are located within attainment areas for the $PM_{2.5}$, PM_{10}, and carbon monoxide standards, carbon monoxide and PM hot-spot analyses are not required. A conformity determination under federal regulations is not needed.

Climate Change

The maintenance and operational GHG emissions for OMF South were calculated using FTA’s Transit Greenhouse Gas Emissions Estimator v3.0 (FTA 2022). Each phase of operation was considered separately and included both upstream and downstream sources of emissions. Upstream emissions are the emissions associated with the extraction, transportation, and production of the fuels and materials used in the operation of the facilities (e.g., natural gas for heating, paint and solvents, fuel for maintenance equipment, etc.). Downstream emissions are generated within the facility during daily operations (e.g., the burning of natural gas for heating, the use of paint and solvents, the burning of fuel for maintenance equipment, etc.).

In total, the OMF South facility would generate between 1,183 and 1,191 metric tons of carbon dioxide equivalent ($MTCO_2e$) per year. Sound Transit and Puget Sound Energy (PSE) have entered into an agreement that all electricity accounts related to the operations of Link light rail be sourced solely from renewable wind power via PSE’s Green Direct program. Therefore, there would be no upstream emissions associated with the project's electricity use. Table 3.8-3 summarizes the project's annual GHG emissions from operation and maintenance. Maintenance activities include routine transit way, pavement, and vehicle maintenance. The annual operational emissions are far below the 10,000 $MTCO_2e$ per year mandatory reporting threshold for facilities in Washington State (Ecology 2020).

Table 3.8-3 Annual Operational Greenhouse Gas Emissions

Emission Source	Preferred Alternative	South 344th Street Alternative	Midway Landfill Alternative
Operations – Upstream	0[1]	0	0
Operations – Downstream	1,149	1,149	1,149
Maintenance	41	42	34
Total Annual GHG Emissions	**1,190**	**1,191**	**1,183**

Note:

(1) Emissions are reported in $MTCO_2e$.

3.8.2.3 Construction Impacts

Impacts Common to All Build Alternatives

Because all the build alternatives would have a similar footprint and, as a result, similar on-site construction activities, the description of impacts below applies to all OMF South build alternatives. However, the large number of truck trips required for two of the Midway Landfill subsurface construction design options — Hybrid and Full Excavation — would result in additional off-site emissions. The emissions associated with those additional haul truck trips are reflected in Table 3.8-2 below.

Air Quality

During construction, short-term degradation of air quality may occur due to the release of particulate emissions generated by excavation, grading, hauling, and other activities. Emissions from construction equipment would include carbon monoxide, nitrogen oxides, sulfur dioxide, volatile organic compounds, and directly emitted particulate matter ($PM_{2.5}$ and PM_{10}).

Site preparation and project construction would involve clearing, cut-and-fill activities, grading, and building activities. Table 2.3-1, Estimated OMF South Construction Durations, reports the estimated site preparation and facility construction durations for each build alternative. Construction-related effects on air quality from the proposed project would be greatest during the site preparation phase because most engine emissions are associated with the excavation, handling, and transport of soil to and from the site.

Sources of fugitive dust (primarily consisting of PM_{10}) could include disturbed soil at the construction sites and trucks carrying uncovered loads of soil. Unless properly controlled, vehicles leaving the site could deposit dirt and mud on local streets, which could be an additional source of airborne dust after it dries. PM_{10} emissions would vary from day to day, depending on the nature and magnitude of construction activity and local weather conditions. PM_{10} emissions would depend on soil moisture, silt content of soil, wind speed, and the amount of operating equipment. Larger dust particles would settle near the source, while fine particles would be dispersed over greater distances from the construction site.

Water or other soil stabilizers can be used to control dust, resulting in emission reductions of 50 percent or more. With the implementation of standard construction measures, such as frequent watering (e.g., two times per day at a minimum), fugitive dust emissions from construction activities would not result in adverse air quality impacts.

In addition to dust-related PM_{10} emissions, heavy trucks and construction equipment powered by gasoline and diesel engines would generate carbon monoxide, sulfur dioxide, nitrogen oxides, volatile organic compounds, and some soot particulate ($PM_{2.5}$ and PM_{10}) in exhaust emissions. If construction activities were to increase traffic congestion in the area, carbon monoxide and other emissions from traffic would increase slightly while those vehicles are delayed. These emissions would be temporary and limited to the immediate area surrounding the construction sites.

Climate Change

The construction GHG emissions for OMF South were calculated using the FTA’s Transit Greenhouse Gas Emissions Estimator (FTA 2022). These emission estimates are based on the size of the proposed facilities and the number of truck trips required to complete the excavation of each alternative and design option. Each phase of construction was considered separately and included both upstream and downstream sources of emissions.

In the construction phase of a transit project, upstream emissions are the emissions associated with the extraction, transportation, and production of the materials used in the construction of the facilities (e.g., asphalt, concrete, base stone, and steel). Downstream construction emissions are tailpipe emissions resulting from the operation of construction vehicles and equipment. In total, construction of the project would generate up to 1,944 $MTCO_2e$ per year. This total reflects an amortization of construction emissions over a 50-year period, which corresponds to the minimum useful life span of facilities (FTA 2017).

As shown in Table 3.8-3, operation and maintenance of OMF South would generate up to 1,191 $MTCO_2e$ per year. Although construction emissions are not included in the Washington State Agency Greenhouse Gas Calculator, the amortized emissions from construction have been added to the operational emissions to determine the total annual impact of the OMF South build alternatives. Table 3.8-4 summarizes the annual GHG emissions from construction, operation, and maintenance for each of the build alternatives. The largest impact would be from the Midway Landfill Alternative using the Full Excavation subsurface construction design option, which would generate up to 3,127 $MTCO_2e$ per year. This amount is less than the 10,000 $MTCO_2e$ per year mandatory reporting threshold for facilities in Washington State (Ecology 2020). Therefore, no additional analysis is required.

Table 3.8-4 Total Annual Greenhouse Gas Emissions

Build Alternative	Mainline Track Construction[1]		OMF Site Construction		Haul Truck Emissions	Operation and Maintenance	Annual GHG Emissions
	Upstream	Downstream	Upstream	Downstream			
Preferred	108	4	1,165	23	60	1,190	2,550
South 344th Street	129	5	1,165	23	75	1,191	2,588
Midway Landfill – Platform	N/A	N/A	1,165	23	284	1,183	2,655
Midway Landfill – Hybrid	N/A	N/A	1,165	23	684	1,183	3,055
Midway Landfill – Full Excavation	N/A	N/A	1,165	23	756	1,183	3,127

Notes: Construction emissions, including truck haul trips, have been amortized over a 50-year period prior to being added to the annual operations and maintenance emissions. Emissions are reported in $MTCO_2e$.

(1) If neither the Preferred nor the South 344th Street alternative is selected, the mainline could be built later in time if TDLE is constructed as proposed. TDLE is currently under environmental review.

3.8.2.4 Social Cost of Greenhouse Gas Emissions

The analysis of the social cost of GHG emissions estimates the monetary value of the net harm to society associated with emission of carbon dioxide, methane, nitrous oxide, or other GHGs in a given year that contribute to climate change (EPA 2023b). Following guidance on analyzing GHGs under NEPA (CEQ 2023), the social cost is estimated based on the annual $MTCO_2e$ emissions from the construction and operation of the build alternatives (see Table 3.8-4) multiplied by the average cost per $MTCO_2e$ determined by EPA.

Table 3.8-5 lists the social costs and emission equivalencies for the Build Alternatives from EPA's Greenhouse Gas Equivalencies Calculator (EPA 2024b).

Table 3.8-5 Social Cost of GHG Emissions and Emission Equivalencies

Build Alternative	Social Cost of GHG Emissions for the Year 2040 (2020 dollars)[1]	Number of Gasoline Powered Passenger Vehicles Driven for 1 Year for which GHG Emissions are Equivalent
Preferred	$688,500	567
South 344th Street	$698,760	576
Midway Landfill (Platform)	$716,850	591
Midway Landfill (Hybrid)	$824,850	680
Midway Landfill (Full Excavation)	$844,290	696

Notes:

(1) The estimated 2040 average cost, in 2020 dollars, is $270 (using the projected 2.0 percent near-term discount rate) per $MTCO_2e$. EPA projects rates at 10-year increments; 2040 was chosen for this analysis because it is the closest year to the OMF South design year of 2042.

3.8.2.5 Avoidance and Minimization of Impacts

Sound Transit would implement construction BMPs to minimize the impact on existing residential and recreational uses from construction-related emissions and fugitive dust, including the development of a fugitive dust control plan. Such plans typically include the following:

- Identification of all fugitive dust sources
- A source-specific description of the proposed dust control method(s)
- A prescribed method to identify how often, how much or when the control method is to be used
- Monitoring and recordkeeping plans and requirements
- A backup plan in case the first control plan is not successful
- The contact information for the person responsible for making sure the plan is implemented and who can be contacted for dust complaints (Ecology 2016)

BMPs to reduce construction impacts would be incorporated into construction plans and specifications and could include the following:

- Complying with the BMPs required in WAC 173-400-040 (general standards for maximum emissions)
- Complying with applicable dust control policies and plans
- Spraying dry soil with water to reduce dust
- Using temporary ground covers
- Minimizing idling of equipment when not in use
- Planning construction areas to minimize soil exposure for extended periods
- Covering dirt and gravel piles
- Establishing wheel wash stations at exits from spoils handling and truck-loading sites
- Sweeping paved roadways to reduce mud and dust
- Replanting exposed areas as soon as practical after construction

Sound Transit would implement the following measures to minimize, reduce, or control air emissions from the on-site paint booth:

- Install exhaust ventilation to remove particulates
- Dispose of paint materials appropriately
- Provide personal protective equipment to staff

3.8.2.6 Indirect Impacts

Indirect impacts are changes to air quality that may occur for reasons related to the project but are not part of it and that may occur separated by distance or time. The air quality analysis includes the indirect effects of the project and other traffic growth that would be associated with the project. Indirect construction GHG emissions are also known as embodied and life-cycle emissions. Both embodied and life-cycle emissions were included in the direct construction GHG methodology.

The expanded light rail system, which the OMF South would support, reduces regional vehicle miles of travel and associated auto-related criteria pollutants within the region (Sound Transit 2016). Therefore, the build alternatives would indirectly support improvements in air quality.

3.8.3 Mitigation Measures

Overall, existing air quality in the project area meets the national standards for criteria pollutants. With implementation of the controls required for the various aspects of construction activities and consistent use of BMPs to minimize on-site emissions, construction and operation of the proposed project would not be expected to substantially affect air quality. No mitigation is anticipated.

3.9 Noise and Vibration

This section contains the noise and vibration impact assessment for the OMF South project alternatives. Sound Transit uses FTA noise and vibration guidance in its environmental methodology to assess impacts from transit projects.

For the purposes of the noise analysis, sound is defined as small changes in air pressure above and below the standard atmospheric pressure, and noise is usually considered to be unwanted sound. The three parameters that define noise include:

- **Level:** The level of sound is the magnitude of air pressure change above and below atmospheric pressure and is expressed in decibels (dB). Typical sounds fall within a range between 0 dB (the approximate lower limit of human hearing) and 120 dB (the highest sound level generally experienced in the environment).
- **Frequency:** The frequency (pitch or tone) of sound is the rate of air pressure change and is expressed in cycles per second, or hertz (Hz). Human ears can detect a wide range of frequencies from around 20 to 20,000 Hz. The A-weighting system, which reduces the sound levels of higher- and lower-frequency sounds, is used to provide a measure (A-weighted decibels, or dBA) that correlates with human response to noise.
- **Time Pattern:** Because environmental noise is constantly changing, it is common to condense all this information into a single number, called the “equivalent” sound level (Leq). The Leq represents the changing sound level over a period of time, typically 1 hour or 24 hours in transit noise assessments. For assessing the noise impact of rail projects at residential land uses, the day-night sound level (Ldn) is used, which is a 24-hour cumulative noise exposure metric that accounts for increased noise sensitivity at night.

FTA criteria are based on both the existing level of noise and the change in noise exposure due to a project and depend on the land use category of the sensitive receptor. The descriptors and criteria for assessing noise impact vary according to land use categories adjacent to the project. For Category 2, land uses where people live and sleep (e.g., residential neighborhoods, hospitals, and hotels), the Ldn is the assessment parameter. For other land use types (Category 1 or 3) where there are noise-sensitive uses (e.g., outdoor concert areas, schools, and libraries), the Leq for an hour of noise sensitivity that coincides with train activity is the assessment parameter.

In addition, the noise assessment evaluates the noise impacts of the OMF at each build alternative under WAC 173-60, Maximum Environmental Noise Levels, which is used by Federal Way and Kent. WAC 173-60 defines the maximum allowable noise level (expressed as Leq) for each noise abatement designation, or land use zone, which can also be defined as residential, commercial, or industrial. As the WAC regulations only apply to stationary noise sources, the mainline track transit operations were not evaluated under these criteria.

For the purposes of the vibration analysis, ground-borne vibration from trains refers to the fluctuating or oscillatory motion experienced by persons on the ground and in buildings near railroad tracks. The response of humans, buildings, and equipment to vibration is most accurately described using velocity or acceleration. Because the human body tends to respond to an average of the vibration impulses, the root mean square (RMS) velocity is used to describe the "smoothed" vibration amplitude. RMS velocities are normally described in inches per second (in/sec) in the U.S., which can be expressed in decibel notation as vibration decibels (VdB).

Typical vibration levels can range from below 50 to 100 VdB, and the human threshold of perception is approximately 65 VdB. The operational vibration impact criteria used for the project are based on the information contained in Section 6 of the FTA Transit Noise and Vibration Impact Assessment Manual (FTA 2018). The criteria for a general vibration assessment are based on land use and train frequency.

See Appendix G2, Noise and Vibration Technical Report, for further information on FTA noise and vibration criteria, WAC limits and applicability to the project, and more detail about the noise and vibration assessment.

3.9.1 Affected Environment

3.9.1.1 Noise- and Vibration-Sensitive Land Uses

Sensitive receptors near the build alternatives sites include single-family and multi-family residences, hotels, and religious facilities. There are no commercial or industrial land uses nor any special buildings, such as recording studios or buildings with specialized equipment highly sensitive to vibration, known to be near any of the build alternatives.

Preferred Alternative

The noise-sensitive land uses adjacent to the mainline track options and the test track between the Federal Way Downtown Station and the Preferred Alternative are a mix of single- and multi-family residences.

The study area around the Preferred Alternative OMF site includes a mix of commercial and noise-sensitive residential land uses. To the north of the OMF site is a noise-sensitive residential community with a mix of single- and multi-family residences and the Russian-Ukrainian Seventh-Day Adventist Church. To the south is a mix of commercial uses with a few scattered noise-sensitive residences and the Restoration Life Church. To the west are commercial uses on both sides of SR 99, along with the KAC Baptist Church, and I-5 is to the east.

South 344th Street Alternative

The land uses around the mainline track options and the test track between the Federal Way Downtown Station and the South 344th Street Alternative are the same as described above for the Preferred Alternative. The land uses around the mainline tail track alignments to the south of the South 344th Street Alternative are commercial, with no noise-sensitive land uses.

The study area around the South 344th Street Alternative includes a mix of commercial, institutional, and noise-sensitive residential land uses. To the north of the OMF site is a noise-sensitive residential community with a mix of single- and multi-family residences, the Christian Faith Center and associated school, the Russian-Ukrainian Seventh-Day Adventist Church, and the KAC Baptist Church. To the south are commercial uses. To the west are commercial uses on both sides of SR 99, and I-5 is to the east.

Midway Landfill Alternative

The land use around the Midway Landfill Alternative includes primarily commercial land uses to the west on both sides of SR 99, along with three religious facilities that are noise sensitive: the Great Commission Presbyterian Church, the New Jerusalem Haitian Baptist Church, and the

Seattle Full Gospel Church. Noise-sensitive uses also include a mobile home park to the north and hotels and a single-family residential community to the south.

3.9.1.2 Existing Noise Conditions

Existing ambient noise levels were characterized through 24-hour direct measurements at selected sites in the areas near the OMF South alternatives during November 2019. Noise sources in the project area include traffic on I-5, local roadway traffic, aircraft overflights, and local community activities. The existing ambient sound levels vary by location, depending on the proximity to I-5, and are generally typical of a suburban environment near a busy interstate highway. The results of the existing noise measurements are shown in Table 3.9-1, and the locations of the measurements are shown in Figures 3.9-1 through 3.9-3.

Table 3.9-1 Summary of Existing Ambient Noise Measurement Results

Site	Measurement Location Description	Meas. Duration (hours)	Noise Exposure (dBA) Ldn	Noise Exposure (dBA) 1 Hour Leq
D	Mainline Track – 11 The Dunes Court, Belmor	24	65	59
E	Mainline Track – 326 Oakland Hills Boulevard, Belmor	24	70	65
F	Preferred Alt/S 344th – Christian Faith Center West	24	67	62

3.9.1.3 Existing Vibration Conditions

Vibration-sensitive land uses for the build alternatives are the same as the noise-sensitive land uses described above. Existing vibration sources include auto, bus, and truck traffic on local streets. However, vibrations from street traffic are not generally perceptible at receivers in the study area unless streets have substantial bumps, potholes, or other uneven surfaces. Furthermore, the FTA vibration impact criteria are not ambient based; that is, future project vibrations are not compared with existing vibrations to assess impact. Therefore, the vibration measurements for the project focused on characterizing the vibration propagation properties of the soil along the mainline track design options rather than characterizing the existing vibration levels. One vibration propagation test site, Site VP-A in Belmor, was selected for the 2019 measurements. The location of the site is shown in Figures 3.9-1 and 3.9-2.

Measurement Locations for Existing Ambient Noise: Midway Landfill Alternative

3.9.2 Environmental Impacts

3.9.2.1 No-Build Alternative

Under the No-Build Alternative, impacts to noise and vibration from construction or operation of OMF South would not occur. However, other planned projects would have impacts in the OMF South study areas. This includes TDLE, which overlaps with the OMF South Preferred and South 344th Street alternatives. The noise and vibration effects of FWLE on sensitive receptors near the Midway Landfill Alternative were addressed in the 2016 Federal Way Link Extension Final Environmental Impact Statement. FWLE constructed noise walls adjacent to the residential areas near the Midway Landfill to mitigate the anticipated noise impacts from that project. No vibration impacts from FWLE are anticipated in the area. If TDLE is constructed as proposed, the mainline track associated with these OMF alternatives would be built later in time. The noise and vibration effects of TDLE and Federal Way's City Center Access Project on sensitive receptors within the study area for the Preferred and South 344th Street alternatives are discussed in Chapter 4, Cumulative Effects Analysis. Noise and vibration impacts from TDLE will be further detailed in the TDLE Draft EIS, which is expected to be published in mid-2024.

3.9.2.2 Long-Term Impacts

Impacts Common to All Build Alternatives

Noise-generating activities at OMF South would include vehicles moving within the OMF site, vehicle washing and drying, limited testing of train bells and horns, a traction power substation, and vehicles moving on the mainline tracks (for the Preferred and the South 344th Street alternatives) into service in the morning and back to the OMF in the late evening, and test track operations.

Wheel squeal is possible on curves with a radius of less than 600 to 1,000 feet, depending on the speed and type of trackway. Wheel squeal is not included in the noise model because Sound Transit has committed to reducing any potential wheel squeal by installing wayside lubricators on all curves with a radius of less than 600 feet in noise-sensitive areas and by preparing all curves for wayside lubricators that have a radius of between 600 and 1,000 feet. There are numerous tight radius curves within the OMF sites for all three build alternatives that would also be prepared for wayside lubricators.

The slow speeds within the OMF South site would reduce any impact noise associated with crossover connections between tracks within the facility. Crossover tracks connecting to the mainline tracks would have higher speed operations and the potential for additional noise from vehicles traveling over them.

There are no FTA noise impacts or WAC exceedances associated with the OMF sites for any of the build alternatives. Noise impacts for the mainline tracks are discussed below. There are no vibration impacts associated with any of the build alternatives for all project elements including the mainline tracks.

Preferred Alternative

As several homes would be acquired along the mainline alignment, there would be no residential receptors immediately adjacent to the mainline or test tracks. As a result, there are no FTA noise impacts for the 40 mph Alignment, but there are FTA noise impacts at four single-family residences for the 55 mph Design Option, all due to their proximity to the proposed mainline tracks. The noise impact locations are described in Table 3.9-2 for the 40 mph Alignment and are described in Table 3.9-3 and shown in Figure 3.9-4 for the 55 mph Design Option.

Tables 3.9-2 and 3.9-3 compare the estimated noise levels from the project against existing noise levels to determine the locations and severity of any noise impacts based on the FTA noise criteria. The existing noise level was measured at locations near the OMF and mainline tracks, as described in the Affected Environment section above. The project noise level was determined based on project parameters, such as the speed of the trains, headways and hours of operation, and the distance to sensitive receptors from the tracks. FTA moderate and severe noise criteria are based on the existing noise level (see Appendix G2, Noise and Vibration Technical Report, for information regarding the determination of the impact criteria). There are no noise or vibration sensitive receptors near the mainline tail tracks and no FTA noise impacts, WAC exceedances, or vibration impacts. There are no FTA noise impacts, WAC exceedances, or vibration impacts for the Preferred Alternative OMF site. The only activity that would generate vibration would be vehicles moving on the mainline or test tracks. Details regarding the model and assumptions used for the noise and vibration impact assessment are included in Appendix G2, Noise and Vibration Technical Report.

Table 3.9-2 Summary of Noise Impacts: 40 mph Alignment Mainline Track

Location	Side of Track	Distance to Nearest Proposed Track (feet)	Existing Noise Level (Ldn, dBA)	Project Noise Level (Ldn, dBA)	Moderate Noise Criteria	Severe Noise Criteria	# of Moderate Impacts	# of Severe Impacts
S 324th Street to Burning Tree Boulevard	SB[1]	80	70	62	64	69	0	0
Burning Tree Boulevard to S 330th Street	SB	111	70	56	64	69	0	0
S 330th Street to S 333rd Street	SB	81	72	58	65	71	0	0
S 333rd Street to S 336th Street	SB	197	72	64 (58)[2]	65	71	0 (0)[2]	0 (0)[2]
Total:							**0 (0)[2]**	**0 (0)[2]**

Note: If neither the Preferred nor the South 344th Street alternative is selected, the mainline could be built later in time if TDLE is constructed as proposed. TDLE is currently under environmental review.

(1) SB = southbound

(2) The Preferred Alternative is shown first followed by the South 344th Street Alternative in parenthesis. The lead tracks and crossovers from the OMF would be further south for the South 344th Street Alternative in comparison to the Preferred Alternative.

Table 3.9-3 Summary of Noise Impacts: 55 mph Design Option Mainline Track

Location	Side of Track	Distance to Nearest Proposed Track (feet)	Existing Noise Level (Ldn, dBA)	Project Noise Level (Ldn, dBA)	Moderate Noise Criteria	Severe Noise Criteria	# of Moderate Impacts	# of Severe Impacts
S 324th Street to Burning Tree Boulevard	NB[1]	76	65	61	64	69	2	0
S 324th Street to Burning Tree Boulevard	SB[1]	57	65	63	61	66	2	0
Burning Tree Boulevard to S 330th Street	SB	85	70	57	64	69	0	0
S 330th Street to S 333rd Street	SB	81	72	58	65	71	0	0
S 333rd Street to S 336th Street	SB	197	72	64 (58)[2]	65	71	0 (0)[2]	0 (0)[2]
						Total:	**4 (0)[2]**	**0 (0)[2]**

Note: If neither the Preferred nor the South 344th Street alternative is selected, the mainline could be built later in time if TDLE is constructed as proposed. TDLE is currently under environmental review.

(1) NB = northbound, SB = southbound

(2) The Preferred Alternative is shown first followed by the South 344th Street Alternative in parenthesis. The lead tracks and crossovers from the OMF would be further south for the South 344th Street Alternative in comparison to the Preferred Alternative.

Construction of either mainline alignment would modify a portion of an existing berm and remove noise walls adjacent to I-5 that screen residences from traffic noise between S 320th Street and S 336th Street. The berm and noise walls were anticipated to be removed by the City of Federal Way's City Center Access Project, which would construct a new interchange with roundabouts and a new bridge over I-5 at S 324th Street. However, the City Center Access Project is now anticipated to be constructed after OMF South. As a result, Sound Transit would modify the existing berm and remove approximately 1,390 linear feet of noise walls as part of the OMF South project.

While the retained fill structure to support the mainline would serve as a barrier to traffic noise from I-5, the modification of the existing berm and noise walls is anticipated to result in traffic noise impacts for about one to three residences (Sound Transit 2023a). In final design, Sound Transit would conduct additional noise analysis in coordination with Federal Way and WSDOT to verify the findings of the noise analysis, determine whether replacement of noise walls would be necessary, and ensure that the location of any new noise walls would be consistent with the plans for the City Center Access Project.

Noise Impact Locations
55 mph Design Option
OMF South

South 344th Street Alternative

Impacts due to the mainline tracks and test track would be the same as those discussed above for the Preferred Alternative, described in Tables 3.9-2 and 3.9-3 and shown in Figure 3.9-4.

There are no noise or vibration sensitive receptors near either of the mainline tail track options and no FTA noise impacts, WAC exceedances, or vibration impacts. There are no FTA noise impacts, WAC exceedances, or vibration impacts for the South 344th Street Alternative OMF site.

Midway Landfill Alternative

There are no FTA noise impacts, WAC exceedances, or vibration impacts for the Midway Landfill Alternative.

3.9.2.3 Construction Impacts

Impacts Common to All Build Alternatives

Noise

Elevated noise levels from construction activities are, to a degree, unavoidable for this type of project. For most construction equipment, diesel engines are typically the dominant noise source. For other activities, such as impact pile driving and jackhammering, noise generated by the actual process dominates. Noise during construction of the project can be intrusive to residents near the construction sites. Most of the construction would consist of site preparation and laying new tracks and should occur primarily during daytime hours, except when required and within city noise ordinance procedures for a variance. At some locations, more extensive work would occur, such as pile driving for elevated structures and retaining walls.

Construction noise predictions at noise-sensitive locations depend on the amount of noise during each construction phase, the duration of the noise, and the distance from the construction activities to the sensitive receptor. Conducting a construction noise impact assessment requires knowledge of the equipment likely to be used, the duration of its use, and the way it would be used by a contractor. Table 3.9-4 provides an example of a construction noise projection for typical at-grade track construction. Construction for other project features, such as buildings, would have similar results. Using these assumptions, an 8-hour Leq of 88 dBA would be projected at a distance of 50 feet from the construction site.

Table 3.9-4 Typical Construction Scenario, At-Grade Track

Equipment Type	Typical Noise Level at 50 Feet (dBA)	Equipment Utilization Factor	Leq (dBA)
Grader	85	50%	82
Backhoe	80	40%	76
Compactor	82	20%	75
Loader	85	20%	78
Roller	74	20%	67
Truck	88	40%	84
Crane, mobile	83	20%	76
Total 8-hour workday Leq at 50 feet:			**88**

Within residential land uses, the potential noise impacts from short-term, at-grade track construction could extend to approximately 120 feet from the corridor; however, if nighttime construction is conducted (when sensitivity to noise is higher and the criteria for impacts are lower), the potential for short-term noise impacts from at-grade track construction could extend to approximately 380 feet from the corridor. The distances of noise impacts would likely be similar for OMF site construction. For elevated structure construction, the distance for noise impacts during the daytime could be up to 250 feet for impact pile driving, assuming a usage factor of 20 percent during the day. If alternative methods of piling are used, the impact distance could be less.

Based on the distances above, there would be sensitive receptors within the screening distances for all three OMF South build alternatives and both mainline track design options. Noise impacts perceived by residents and other sensitive receptors would vary, depending on the proximity of the construction activity, the type of equipment being used, the time of day, and the overall duration of construction. While the noise levels would be similar for construction of any of the build alternatives, the Midway Landfill Alternative would have the greatest impact due to the extended period of time and number of daily truck trips needed for site preparation work.

Vibration

Unlike typical light rail transit operations, there is the potential for damage to nearby structures at close distances due to vibration from construction activities, such as pile driving, hoe rams, vibratory compaction, and loaded trucks. Most limits on construction vibration are based on reducing the potential for damage to nearby structures. Although construction vibrations are only temporary, it is still reasonable to assess the potential for human annoyance and damage.

As a conservative approach, the potential for construction vibration impacts was assessed based on the vibration damage criteria for the non-engineered timber and masonry building category (Category III) in the FTA guidance manual (FTA 2018). A vibration criterion of 94 VdB was used to assess potential damage impact, and the operational vibration criterion of 72 VdB was used to assess potential vibration annoyance from construction activities. With the exception of impact pile driving, the potential for vibration damage is limited to within 25 feet of construction activities. For impact pile driving, the screening distance for potential vibration damage is 55 feet. There are no sensitive receptors within 25 feet of the project alternatives, but there are several within 55 feet of both mainline alignments (40 mph Alignment and 55 mph Design Option) in Belmor. However, any potential for impacts would depend on the method of pile installation.

Because the exact location of construction equipment is important in projecting vibration levels, a more detailed assessment of potential vibration damage will be performed during final design when more accurate equipment locations are known.

3.9.2.4 Avoidance and Minimization of Impacts

For the Preferred and South 344th Street alternatives, the curves of the mainline 40 mph Alignment north of S 324th Street and from S 324th Street to Oakland Hills Boulevard would have a radius between 600 and 1,000 feet and would be prepared for wayside lubricators.

Construction activities would be carried out in compliance with Sound Transit specifications and applicable local noise regulations. Construction noise is exempt from the WAC noise limits, except at residential land uses during nighttime hours (10 p.m. to 7 a.m.). If construction is performed during nighttime hours, the contractor must meet the WAC noise level requirements or obtain a noise variance from the governing jurisdiction.

Noise-control for nighttime or daytime work may include the following measures, as necessary, to meet required noise limits and minimize temporary vibration impacts. These measures would be confirmed during final design and, if needed, the approval process for any noise variances:

- Avoiding nighttime construction in residential neighborhoods when possible
- Locating stationary construction equipment as far as possible from noise-sensitive sites
- Constructing noise barriers, such as temporary walls or piles of excavated material, between noisy activities and noise-sensitive receivers
- Routing construction-related truck traffic to roadways that would cause the least disturbance to residents
- Using alternative construction methods to minimize the use of impact and vibratory equipment (e.g., pile-drivers and compactors). If pile driving is necessary, it would be limited to daytime hours

In addition to the measures listed above, a detailed Noise and Vibration Control Plan would be required from the contractor as part of construction. Key elements of a plan would include:

- Contractor's specific equipment types
- Schedule (dates and times of day) and methods of construction
- Maximum noise limits for each piece of equipment with certification testing
- Prohibitions on certain types of equipment and processes during the night or daytime hours per local agency coordination and approved variances
- Identification of specific sensitive receptors near construction sites
- Methods for predicting construction noise levels
- Implementation of noise and vibration control measures where appropriate
- Methods for responding to community complaints in compliance with Sound Transit outreach requirements

3.9.2.5 Indirect Impacts

No indirect impacts related to noise and vibration would result from construction and operation of the proposed project. Most vehicle traffic and other sources of environmental vibration are below the levels of human perception and would not cause an indirect impact.

3.9.3 Mitigation Measures

3.9.3.1 Long-Term Measures

When noise would exceed FTA moderate or severe impact criteria, Sound Transit would provide noise mitigation measures consistent with its Link Light Rail Noise and Vibration Policy (Resolution No. R2023-15) (Sound Transit 2023b) and the Transit Noise and Vibration Impact Assessment Manual (FTA 2018). The Sound Transit Link Noise Mitigation Policy provides the hierarchy for implementation of mitigation measures. It prioritizes reduction at the noise source, followed by measures to disrupt the noise path, such as sound walls. Lastly it considers residential sound insulation. For the Preferred and South 344th Street alternatives, noise barriers are proposed for mitigation along the 55 mph Design Option elevated mainline track (Figure 3.9-5).

Noise barrier locations and lengths are described in Table 3.9-5. Typical noise barriers are 4 feet in height on elevated structures. Assuming 4-foot barriers on the elevated structure at the locations described below, the barriers would provide approximately 8 dBA of noise reduction, and there would be no residual impacts after mitigation. No mitigation would be necessary for the Midway Landfill Alternative.

Table 3.9-5 Summary of Potential Noise Barrier Locations

Mainline Track Options	Approximate Location	Noise Barrier Length (ft)
55 mph Design Option	Northbound side from south of Park & Ride to south of Burning Tree Boulevard	360
55 mph Design Option	Southbound side from south of Park & Ride to south of Burning Tree Boulevard	325

During final design, the noise analysis will be updated based on the more advanced design. All predicted noise levels and mitigation measures would be reviewed, and mitigation would be modified as needed to reduce noise levels to below the FTA impact criteria. If equivalent mitigation could be achieved by a less costly means or if the final design analysis shows no impact, then the mitigation measure may be modified or eliminated. After light rail operations begin, if the resulting noise were to exceed FTA criteria, Sound Transit would evaluate the need for additional mitigation.

For the Preferred and South 344th Street alternatives, Sound Transit would provide traffic noise mitigation measures where traffic noise levels are predicted to be above the 2042 No-Build levels from removal of the existing WSDOT berm and noise wall. Mitigation would be designed to maintain 2042 No-Build levels and could include replacement of noise walls and berms. Sound Transit would conduct additional noise analysis during final design in coordination with WSDOT to confirm whether noise mitigation is needed.

The noise mitigation for the cumulative effects of TDLE on sensitive receptors for the Preferred and South 344th Street alternatives, including the mainline tracks, and the City Center Access Project are discussed in Chapter 4, Cumulative Effects Analysis, and will be further detailed in the TDLE Draft EIS, which is expected to be published in mid-2024, and the City Center Access Project Noise Discipline Report.

3.9.3.2 Construction Measures

Through compliance with applicable construction permits and implementation of avoidance and minimization measures described in Section 3.9.2.4, Avoidance and Minimization of Impacts, no mitigation for construction noise impacts would be needed.

OMF South

3.10 Ecosystem Resources

This section evaluates the potential effects of the OMF South project alternatives on ecosystem resources, which include aquatic species and habitat; vegetation, wildlife, and wildlife habitat; and wetlands. Analyses in this section also evaluate potential effects on Essential Fish Habitat and threatened and endangered species that would typically be addressed during consultation under Section 7 of the Endangered Species Act (ESA). The Ecosystem Resources Technical Report (Appendix G3) provides detailed information on the regulations, analysis methods, affected environment, species, and impacts discussed in this section.

The study area for aquatic resources and wetlands includes all areas within 300 feet of the proposed construction limits of the project. This encompasses the area within which project construction and operation could deliver sediment to streams and where vegetation clearing could affect riparian habitat quality. This distance is also the largest potential width of regulatory buffers for wetlands that may be required in the project area. To address the potential impacts of stormwater runoff on fish, resource analysts also identified fish species that are known or expected to use aquatic habitats downstream of the study area.

The study area for terrestrial resources includes areas within 200 feet of the proposed construction limits of the project. This represents a conservative estimate of the area in which project construction and operation could affect vegetation cover and habitat quality for terrestrial wildlife. To address wildlife potentially affected by project-related noise and human activity, resource analysts also reviewed documented occurrences of sensitive wildlife species within 0.25 mile of project construction areas.

3.10.1 Affected Environment

3.10.1.1 Aquatic Species and Habitat

The assessment of aquatic species and habitat focused on features that may be affected by the project and that are directly related to ecological functions that support aquatic ecosystems. After collecting and reviewing existing information, biologists conducted detailed field reconnaissance and delineation surveys within the study area to identify and confirm ecosystem resources that could be affected. While formal surveyed delineations are typically completed during the permitting process, biologists conducted formal delineations of the ordinary high water line of tributaries to Hylebos Creek to inform discussions with Tribes, agencies, and the public and to guide the design to avoid or minimize impacts. More detailed information about streams and aquatic species in the study area is available in Appendix G3, Ecosystem Resources Technical Report.

The study area includes two streams: East Fork Hylebos Creek Tributary 0016A and West Fork Hylebos Creek Tributary 0014C (Figures 3.10-1 and 3.10-2), referred to East Fork Hylebos Tributary and West Fork Hylebos Tributary, respectively, in this Final EIS. Both are tributaries to Hylebos Creek, an independent tributary that discharges to the Hylebos Waterway along the eastern shore of Puget Sound’s Commencement Bay in Tacoma. A third stream, North Fork McSorley Creek, receives discharge from a regional stormwater detention facility at the north end of the study area (Figure 3.10-3). North Fork McSorley Creek would receive additional treated stormwater runoff from the Midway Landfill Alternative but would otherwise not be affected by project construction or operation.

OMF South

Using information gathered during field reconnaissance and from sources such as Tribes, local jurisdictions, WSDOT, and fish passage barrier maps maintained by the Washington State Department of Fish and Wildlife (WDFW), biologists evaluated streams in the study area to identify downstream impediments to fish passage. Salmonids are not currently known or expected to be present in reaches of East Fork Hylebos Tributary or West Fork Hylebos Tributary in the study area. These stream reaches are also not expected to currently support salmonids year-round, given the intermittent flow of the streams and the presence of constructed barriers between the study area and potential population sources downstream. None of these stream reaches is currently known or expected to be used by ESA-listed species, and no critical habitat for any such species has been designated or proposed for designation in these reaches. However, historically accessible reaches of these streams are designated as Essential Fish Habitat for Pacific salmon.

Numerous human-made barriers to fish passage currently exist downstream and throughout the study area, and those barriers deter anadromous salmonids from entering stream reaches in the study area (NWIFC 2023). Several of the downstream barriers on the East Fork Hylebos Tributary are located under I-5 or under on- and off-ramps to I-5 and are on the list of barrier culverts to be made fish passable under a 2013 federal court injunction in western Washington. Even with the removal of the state-owned barriers at some point in the future, several barriers (including two complete barriers on private property) would continue to impede access to stream reaches in the study area. The remaining complete barriers include a private road crossing approximately 1 mile downstream of the study area and a non-culvert barrier (abandoned pipeline) on private property approximately 2.8 miles downstream of the study area. If these privately owned barriers were removed along with WSDOT’s barriers, anadromous salmonids would have access to reaches of East Fork Hylebos Tributary in the study area. No plans for the correction of barriers on West Fork Hylebos Tributary downstream of the study area have been announced.

The basin size, channel width, and gradient of the streams in the study area indicate the potential to support fish use in the future. Coho salmon, steelhead, and cutthroat trout have been documented in East Fork Hylebos Creek approximately 1.9 miles downstream of the Preferred and South 344th Street alternatives (HDR 2014; NWIFC 2023). These species have also been documented in West Fork Hylebos Creek approximately 2.7 miles (steelhead) and 1.7 miles (coho) downstream of the Preferred Alternative (HDR 2014; NWIFC 2023). In addition, fisheries biologists from the Puyallup Tribe of Indians have observed Chinook salmon in West Fork Hylebos Creek as far upstream as S 356th Street, approximately 1.5 miles downstream of the study area (Marks et al. 2018, 2019, 2020, 2021). Finally, a single sub-adult bull trout was captured in West Fork Hylebos Creek in August 2018, approximately 4 miles downstream from the study area from the Preferred Alternative. These observations indicate that resident and anadromous salmonids could have access to stream reaches in the study area in the future, if downstream fish passage barriers are corrected.

East Fork Hylebos Tributary

The headwaters of East Fork Hylebos Tributary are in a wetland complex northeast of I-5 and S 320th Street. The stream is piped under the freeway and beneath the Federal Way/S 320th Street Park & Ride, emerging in the study area in Belmor. The stream flows southward through the study area, confined by I-5 to the east and by residential, commercial, and light industrial developments to the west.

The segment of East Fork Hylebos Tributary in the study area flows intermittently and meets the Federal Way Environmental Critical Areas Code classification as a Type F stream, meaning it has the potential to support fish. The streambed in this area is typically dry during late summer and early fall. Much of the stream is confined within a straight and uniform (ditch-like) channel profile. The gradient of the stream is low, generally 1 percent or less. As a result, fine sediments have accumulated in many areas, resulting in the shallowing and widening of the streambed. Dense patches of reed canarygrass have become established in some low-energy areas, exacerbating the deposition of fine sediments.

Riparian vegetation along East Fork Hylebos Tributary in the study area includes cover types that provide a range of ecological functions. Areas dominated by native forest and wetlands are considered high-quality riparian habitat because they support functions such as fish and wildlife habitat provision; food chain support; water temperature moderation; infiltration; groundwater recharge and discharge; sediment delivery, transport, and storage; organic matter input; nutrient and pathogen removal; and stream channel formation and maintenance. In other areas, riparian habitat quality has been degraded through the conversion of native and structurally complex habitats into landscaping, mowed grasses, or invasive shrubs.

The stream is conveyed under S 336th Street in a pair of 65-foot-long culverts that are classified as partial barriers to fish passage. South of S 336th Street, the stream flows approximately 0.25 mile through a 200- to 300-foot-wide corridor of native forest habitat. At the southern end of this segment, the width of the functional riparian buffer is limited by a retaining wall along the eastern boundary of the Christian Faith Center property. The wall parallels the stream for approximately 500 feet. The width of the vegetated area between the retaining wall and I-5 is approximately 230 to 260 feet.

A few hundred feet north of S 341st Street, the forested riparian corridor narrows to approximately 80 to 100 feet, and it is confined by I-5 on the east and developed properties to the west. An existing retaining wall limits the width of the functional riparian buffer in the southern portion of this area. After flowing through that narrow area for approximately 700 feet, the stream enters a series of culverts associated with the WSDOT stormwater facility north of S 344th Street. One of those culverts is classified as a partial barrier to fish passage (Figure 3.10-1).

West Fork Hylebos Tributary

West Fork Hylebos Tributary flows through the northwestern corner of the project limits of the Preferred Alternative OMF site near the intersection of SR 99 and S 336th Street. Surface-flowing segments near the stream's headwaters are in the mainline track portion of the study area. The segment of West Fork Hylebos Tributary in the study area has intermittent flow and is considered a Type F stream based on its potential to support fish.

The high level of development and associated impervious surfaces in the West Fork Hylebos Creek basin have resulted in severe flooding issues over the years and have contributed to increased peak and base flows in West Fork Hylebos Tributary (King County 1990). As a result, Federal Way has completed numerous flood control projects, including large stormwater facilities throughout the basin.

Within the Preferred Alternative OMF site portion of the study area, West Fork Hylebos Tributary flows through a wetland (Wetland WFW-02) and an associated in-line stormwater detention facility. The stream lacks a defined bed and bank in this wetland area. When it is ponded, this facility could support fish use; however, once the facility drains, there is little or no holding water for fish. The pond's substrate is predominantly fine sediment and, as such, provides no suitable spawning habitat for anadromous or resident salmonid fish. Vegetation within the facility is dominated by native trees and shrubs that provide high-quality riparian habitat. Immediately upstream and downstream of the detention facility, the stream is contained in pipes or in other in-line stormwater facilities. Where it exits the wetland/stormwater facility, the stream flows through a raised outlet standpipe and then enters an approximately 500-foot-long culvert under SR 99. Based on field reviews performed in 2015, the culvert and standpipe have been identified as a complete barrier to fish passage (WDFW 2023).

North Fork McSorley Creek

No surface-flowing portions of North Fork McSorley Creek are within the OMF South study area for the Midway Landfill Alternative. However, a regional stormwater detention facility at the north end of the Midway Landfill site discharges to North Fork McSorley Creek, approximately 1.1 miles from the study area. For this reason, this analysis provides information about fish use in the stream reaches to which the stormwater detention facility discharges. North Fork McSorley Creek is a perennial stream and is considered a Type F stream based on its potential to support fish use.

Electrofishing surveys conducted by Washington Trout (2003) documented the presence of coastal cutthroat trout and western brook lamprey in reaches to which the stormwater detention facility discharges. According to NWIFC (2023), fall-run Chinook salmon, fall-run chum salmon, coho salmon, and winter-run steelhead could potentially use habitats in North Fork McSorley Creek 1.1 miles from the study area, but constructed barriers and/or degraded habitat quality currently preclude their presence.

3.10.1.2 Vegetation, Wildlife, and Wildlife Habitat

Biologists identified and delineated 10 vegetation cover types in the study area and evaluated their relative habitat value. The cover types are commercial, residential, grassland, invasive brush, native brush, non-native forest, mature native forest, other native forest, wetland/stream, and stormwater pond. The relative habitat value of each cover type is based on habitat structure, scarcity in the study area, disturbance types and frequency, and time required for ecosystem functions to recover following clearing and site restoration. Detailed descriptions of the cover types can be found in Appendix G3, Ecosystem Resources Technical Report.

Wildlife use of habitats in urban landscapes depends on the general location of the habitat, the size and type of undisturbed habitats, the degree of connectivity and extent of travel corridors between and among these habitats, and the types and levels of human activity. Much of the study area is dominated by areas of urban development with little vegetation cover and minimal habitat value. Trees and other landscaping in residential areas provide limited habitat value. Other common vegetation cover types, particularly in the rights-of-way of I-5 and other roads, are grassy areas and patches of invasive shrubs, such as Himalayan blackberry. The relative habitat value of developed areas is low to moderate.

Wildlife use of developed areas is generally limited to adaptable species, such as house sparrows, European starlings, rats, mice, raccoons, Virginia opossums, and eastern gray squirrels. Birds such as rock pigeons and cliff swallows commonly build nests on bridges and road overpasses, and many bat species use such structures as temporary roosting sites. Red-tailed hawks and other raptors prey on voles and other small mammals that are found in abundance in grassy vegetation, such as in the I-5 right-of-way. Open-water habitats, such as wetlands and stormwater detention ponds, provide resting and foraging areas for waterfowl. Animals that use habitats in the study area are exposed to high levels of disturbance generated by human activity in commercial, institutional, and industrial areas and by traffic on I-5 and major arterial roadways.

Structurally complex habitats, such as forested areas and wetlands, have more biological diversity and higher value as wildlife habitat. With habitat features such as large trees, snags, decaying logs, and a diverse understory, areas classified as mature native forest typically support diverse communities of forest-associated wildlife. Mature native forests have been identified as priority habitats by WDFW. Most patches of forest cover in the study area are fragmented and separated from surrounding habitat areas by commercial and residential developments and roads. Despite their isolation, these areas still provide habitat for forest-associated resident and migratory songbirds, as well as for hawks, owls, woodpeckers, and small mammals. The largest patches of forested habitat are near the Preferred and South 344th Street alternatives. These areas contain the only patches of mature native forest that have been identified in the study area. One patch, approximately 10 acres in size, parallels I-5 south of S 336th Street.

The Migratory Bird Treaty Act of 1918, administered by the U.S. Fish and Wildlife Service (USFWS), makes it unlawful to take any migratory bird, or the parts, nests, or eggs of any such bird, except under the terms of a valid permit. In the context of this Act, “take” is defined as “pursue, hunt, shoot, capture, collect, kill, or attempt to pursue, hunt, shoot, capture, collect, or kill” (Title 16 U.S. Code [U.S.C.] § 715n). Nearly all bird species that may occur in the study area are protected under the Migratory Bird Treaty Act. Protected birds or bird nests may be present in any of the cover types in the study area. Forested areas, wetlands, and other areas with comparatively complex cover types are likely to support greater densities and more diverse assemblages of nesting birds.

3.10.1.3 Wetlands

Sound Transit identified a total of 23 wetlands in the study area (Figures 3.10-1 through 3.10-3). During scoping, Tribes, agencies, and the public expressed concern about potential impacts on ecosystem resources. Sound Transit determined that detailed information collected early in the process would help the design team avoid and minimize impacts on wetlands. Therefore, biologists performed formal delineations of wetland boundaries in legally accessible areas associated with tributaries of Hylebos Creek. Wetlands that could not be accessed for formal delineations were mapped and characterized at the reconnaissance level. All wetlands analyzed as part of the OMF South EIS process were rated according to local jurisdiction critical area ordinances and the Washington State Wetland Rating System for Western Washington, 2014 Update (Hruby 2014). The Washington State system was updated in 2023, and the wetlands will be reassessed under the new system for the permitting process. Wetlands were delineated or identified based upon the criteria in the U.S. Army Corps of Engineers Wetland Delineation Manual (Environmental Laboratory 1987) and the Regional Supplement to the Corps of Engineers Wetland Delineation Manual: Western Mountains, Valleys and Coast Region (Corps 2010). The delineation methods were not affected by the 2023 Supreme Court decision which changes the regulatory status of some "waters of the U.S., including wetlands."

Descriptions of individual wetlands are provided in Appendix G3, Ecosystem Resources Technical Report.

The portion of the study area encompassing the Preferred and South 344th Street alternatives is dominated by commercial, institutional, and industrial development, which includes substantially altered natural wetlands, watercourses, and buffers that are degraded due to development, human disturbance, and abundant non-native and invasive vegetation. Ten wetlands were identified in this portion of the study area. All but one of these are associated with East Fork Hylebos Tributary within the approximately 100- to 300-foot-wide undeveloped forested corridor adjacent to I-5. The remaining wetland, identified as Wetland WFW-02, is contained within the in-line stormwater detention facility associated with West Fork Hylebos Tributary.

At the Midway Landfill Alternative, biologists identified five areas meeting the parameters for wetland hydrology, soils, and vegetation. During preparation of the 2021 SEPA Draft EIS, the U.S. Army Corps of Engineers (Corps) determined that the areas do not meet federal criteria for jurisdictional wetlands (Tong 2019), and Ecology verified that they are non-jurisdictional under state definitions (Gresham 2020). On May 25, 2023, the Supreme Court issued a judgment limiting Corps jurisdiction on "waters of the U.S." Effective September 8, 2023, EPA and the Corps published their amendments to the Revised Definition of Waters of the United States. Ecology, which has state authority under RCW 90.48 to regulate wetlands, will likely issue administrative orders to address impacts to waters of the U.S. the Corps no longer regulates. In the case of these five areas at the Midway Landfill, Sound Transit believes that it is not likely the earlier determination will change because the Supreme Court judgment limits jurisdiction. As such, these areas are not considered regulated wetlands and are not discussed further. However, if the definition of waters of the U.S. were to expand and the Midway Landfill is selected as the project to be built, Sound Transit will comply with the applicable regulations and update project documentation as required. One wetland, previously delineated for the WSDOT SR 509 Project, was identified in the Midway Landfill Alternative portion of the study area north of the proposed OMF South site (Anchor 2019).

3.10.1.4 Threatened and Endangered Species

As discussed in Section 3.10.1.1, no ESA-listed fish are known or expected to be present in the study area under current conditions. However, Chinook salmon and steelhead have been documented in Hylebos Creek and other streams downstream of the study area. In addition, one bull trout was observed in West Fork Hylebos Creek in 2018. In the future, if all downstream barriers to fish passage are removed, individuals of these species could access the study area. Under existing conditions, contaminants in stormwater runoff from roads within the study area could harm these species in stream reaches downstream of the study area.

Five ESA-listed wildlife species (marbled murrelet, yellow-billed cuckoo, streaked horned lark, Taylor’s checkerspot, and North American wolverine) and one species proposed for listing (northwestern pond turtle) potentially occur in areas that might be affected by the project (USFWS 2023). In addition to those species, gray wolves in western Washington have a listing status of endangered. None of these species are expected to occur in the study area because no suitable habitat is present (see Appendix G3, Ecosystem Resources Technical Report). No designated critical habitat for any ESA-listed species is present in the study area. The Washington State Department of Natural Resources (WDNR) Natural Heritage Program database does not include any records of ESA-listed plant populations within 5 miles of the study area (WDNR 2019).

3.10.2 Environmental Impacts

For this analysis, the design team identified a permanent impact footprint for each alternative, based on project features that could result in long-term impacts on ecosystem resources. Each build alternative footprint includes the OMF South site, along with the short segments of lead tracks that connect the site to the mainline tracks and any new mainline tracks that would be constructed to connect the site to the southern terminus of FWLE. The Preferred Alternative and the South 344th Street Alternative include approximately 4,600 linear feet of test track paralleling the mainline tracks. The Preferred Alternative also includes the extension of 18th Place S from S 336th Street to S 340th Street, and the extension of 21st Ave S from S 341st Place to S 344th Street.

The design team also defined a larger temporary impact footprint for each build alternative, encompassing the permanent impact footprint and surrounding areas where vegetation clearing and ground-disturbing work would likely be required for project construction. Areas outside the permanent impact footprint but within the temporary impact footprint would be restored to pre-project conditions, or better, following construction. These footprints were overlaid on mapped locations of wetlands, streams, buffers, and vegetation cover types to determine the extent of the potential impacts of the alternatives on ecosystem resources.

Compared to the impacts of site facilities, road extensions, and at-grade tracks, the impacts of elevated portions of the mainline, lead, tail, and test tracks (under the Preferred Alternative or the South 344th Street Alternative) would be less severe. These structures would be relatively narrow (typically 20 to 30 feet wide) and generally more than 15 feet above the ground surface. Vegetation would be able to grow in such areas, although the density and variety of vegetation would be limited by the reduced availability of sunlight and precipitation. For operational safety, only appropriate short-stature vegetation would be planted under the elevated mainline tracks. Trees and other tall vegetation would not be allowed to grow underneath or within 15 feet of elevated track segments. A similar constraint would apply within 15 feet of at-grade track segments.

Based on site-specific conditions, retaining walls would be built in some areas to minimize disturbance to the aquatic features and their buffers. To allow maintenance access and to avoid damage, trees and other large vegetation would not be allowed to grow near the base or top of the walls.

The tables and figures in Appendix G3, Ecosystem Resources Technical Report, detail the results of the impact analysis. The permanent and temporary impact footprints developed for this analysis represent Sound Transit’s best estimates of the areas that may be affected by the OMF South alternatives. These estimates are conservative. For example, clearing of all areas within the temporary impact footprint may not be necessary, but analyses of construction-related impacts are based on the assumption that the entire temporary impact footprint would be cleared. In addition, the permanent impact footprint may include some areas where project components could be scaled down or eliminated as the project design progresses from its current, preliminary status. Moreover, not all areas within the project footprint would be converted to structures or hard surfaces. Some vegetated areas are expected to be converted to other land cover types, such as landscaping or stormwater facilities; in other areas, existing hard surfaces may be converted to vegetation. Section 3.11, Water Resources, includes more analysis on land cover conversions.

By applying a consistent set of assumptions for all the alternatives, these footprints allow Sound Transit to evaluate the relative degree of the potential impacts of the alternatives on ecosystem resources. Anticipated impacts would be further refined and determined when an alternative is selected to be built and the project design is sufficiently advanced to undergo permitting review. Additional field work would be conducted for the selected alternative to refine the understanding of project impacts.

Analyses of project-related impacts assume that appropriate BMPs would be implemented and would perform as expected to avoid and minimize certain impacts during construction. See Appendix G3, Ecosystem Resources Technical Report, for a discussion of BMPs. For each resource area, analyses of direct impacts are divided between long-term (operational) impacts and short-term (construction-related) impacts. Cumulative impacts are evaluated in Chapter 4.

3.10.2.1 No-Build Alternative

Under the No-Build Alternative, impacts to ecosystem resources from construction or operation of OMF South would not occur. However, other planned projects would have impacts in the OMF South study areas. This includes TDLE, which overlaps with the OMF South Preferred and South 344th Street alternatives. If TDLE is constructed as proposed, the mainline track associated with these OMF alternatives would be built later in time. Impacts associated with construction of the mainline track are addressed within the build alternatives impacts discussion below. All other TDLE-related impacts are addressed in Chapter 4, Cumulative Effects Analysis.

3.10.2.2 Long-Term Impacts

Under any of the build alternatives, direct long-term impacts on ecosystem resources would occur where permanent features, such as proposed project facilities, overlap ecosystem resources, such as wetlands, wetland buffers, streams, stream buffers, or native forest. Long-term impacts of OMF South development on ecosystem resources are described below.

Aquatic Species and Habitat

Direct impacts on aquatic resources would occur where permanent features alter in-stream habitat or riparian functions. As previously discussed, no ESA-listed fish are known or expected to be present in the study area, and the study area contains no critical habitat for any ESA-listed species. Therefore, none of the OMF South alternatives would have the potential for any direct adverse effects on ESA-listed species or critical habitat.

ESA-listed Chinook and steelhead have been documented in Hylebos Creek and both the East and West Fork Hylebos creeks and, therefore, may be present in other tributary stream reaches downstream of the study area. In addition, although bull trout are not expected to use habitats in the Hylebos Creek watershed, one observation of bull trout occurred in West Fork Hylebos Creek in 2018. In the future, if all downstream barriers to fish passage are removed, individuals of these species would have access to the study area.

None of the stream segments in the study area are known or expected to support resident or anadromous salmonids under current conditions. Other aquatic organisms, such as invertebrates and non-salmonid fish, are likely present in those streams, however. In addition, the loss or degradation of stream habitat could reduce the availability of prey (e.g., benthic invertebrates) for fish and other aquatic species in downstream reaches. Impacts on stream habitat could also decrease the availability and quality of habitat for salmonids and other fish in the future if access is restored through the removal of downstream fish passage barriers.

Impacts may also occur where elevated mainline, test, or lead tracks pass over surface-flowing streams. Shade from structures placed over streams may affect the behavior of salmonids in the affected stream segments. Juvenile salmonids may respond to shadows from overwater structures by pausing at the upstream end of the darkened area or moving into deeper waters, potentially increasing their vulnerability to predation (Kemp and Williams 2008; Moore et al. 2013). Although none of the stream segments in the study area currently support salmonids, the presence of these structures could affect fish behavior if access is restored in the future. (These impact areas and length of streams affected are summarized in Table 3.10-1 and depicted in Figures G3.4-1 through G3.4-5 in Appendix G3, Ecosystem Resources Technical Report.)

Where the permanent impact footprint of an OMF South alternative overlaps a stream’s riparian buffer, the ecological function of that buffer would be diminished or lost. Substantial decreases in current riparian function would occur where areas of tree or shrub cover in a stream’s riparian zone are converted to facilities or to other vegetation types (e.g., lawns, ornamental landscaping, areas near tracks) with less structural or compositional diversity. Where riparian vegetation is removed altogether, potential future riparian functions would be eliminated. Potentially affected riparian functions and processes include fish and wildlife habitat provision; food chain support; water temperature maintenance; infiltration; groundwater recharge and discharge; sediment delivery, transport, and storage; organic matter input; nutrient and pathogen removal; pollutant removal; and stream channel formation and maintenance. Impact areas and length of streams affected are summarized in Table 3.10-1 and depicted in Figures G3.4-1 through G3.4-5 in Appendix G3, Ecosystem Resources Technical Report.

Table 3.10-1 Potential Long-Term Impacts on Aquatic Resources

Alternative	Design Option	Project Element	Stream[1]	Stream Impact (linear feet)[2]	Total Stream Impact per Alternative (linear feet)	Stream Channel Daylighted (linear feet)	Stream Buffer Impact (acres)[3]	Total Stream Buffer Impact Per Alternative (acres)

Midway Landfill	N/A	N/A	N/A	0	0	0	0	0

Notes:

(1) Both affected streams are Type F, per WAC 222-16-030 and FWC 19.145.260.

(2) Includes the total length of surface-flowing stream within the permanent impact footprint defined for this analysis.

(3) Impact numbers presented in this table represent all affected areas inside functional stream buffers, including areas that overlap with wetland buffers.

(4) The portion of this stream in the study area lacks a defined bed and bank where it flows through Wetland WFW-02. For this reason, stream impacts are based on the approximate centerline of the mapped stream, and buffer impacts are based on the affected area of Wetland WFW-02. See text for further discussion.

(5) If neither the Preferred nor the South 344th Street alternative is selected, the mainline could be built later in time if TDLE is constructed as proposed. TDLE is currently under environmental review.

The impacts described in Table 3.10-1 reflect potential long-term impacts to streams and aquatic resources based on the overlap between streams or stream buffers and the permanent impact footprint for each alternative. Impacts to aquatic resources within the permanent impact footprint could take several forms. For example, project features (including elevated structures, such as the mainline, test, and lead tracks) would be built near, parallel to, or over surface-flowing stream channels. In certain areas, no ground-disturbing work would take place in the stream channel, but the presence of those structures could have long-term effects on riparian and/or aquatic habitats. In other areas, an existing stream channel would need to be relocated and realigned to accommodate project features. These impacts are described further in the discussions of the impacts of the individual alternatives.

Under any of the build alternatives, runoff from impervious surfaces, including pollution-generating impervious surfaces, would be detained and treated in accordance with local, state, and federal requirements. However, water that passes through stormwater management facilities may still contain contaminants (albeit in reduced concentrations) that could harm fish in receiving waters. These impacts could extend a considerable distance downstream, potentially affecting fish (including ESA-listed species) in stream reaches outside of the study area. In addition, during major storm events, the capacity of those facilities may be exceeded, and some runoff may directly enter streams and other surface waters without receiving treatment. It is important to note that the first-flush runoff from such events (i.e., runoff with the highest concentrations of contaminants) would enter treatment facilities. Bypassing would occur later in the storm event, after most contaminants have washed off.

Recent research has found 6PPD-quinone, a contaminant found in runoff from highways and roadways, to be a major contributor to pre-spawning mortality in coho salmon (Tian et al. 2021). A 2022 study (Brinkman et al. 2022) found that rainbow trout and brook trout were sensitive to exposure, while arctic char and white sturgeon were tolerant. Another study (French et. al 2022) found that urban roadway runoff is lethal to juvenile coho, steelhead, and chinook salmonids but not sockeye. Other harmful contaminants in stormwater runoff from roadways include polycyclic aromatic hydrocarbons, which have been found to cause reduced growth, increased susceptibility to infection, and increased mortality in salmonids (Meador et al. 2006; Varanasi et al. 1993). Another common component of stormwater runoff is dissolved copper, which can impair the olfactory system of salmonids and hinder their predator avoidance behavior (Sandahl et al. 2007). Dissolved zinc is another common component of stormwater that, when at higher concentrations, can lead to internal tissue hypoxia, reduced immunity, osmoregulatory failure, acidosis, and low oxygen tensions in the arterial blood of freshwater fish (Eisler 1993).

Ecology (2022) has evaluated the effectiveness of stormwater facilities in providing treatment that prevents or reduces the toxicity of contaminants in receiving waters. Final design will use this evaluation in the selection and design of stormwater management facilities.

Because the volume of runoff from impervious surfaces would be managed in accordance with local, state, and federal requirements, none of the alternatives would be expected to have long-term adverse effects on flow regimes in streams. Peak stream flows would not increase because the stormwater systems built for the proposed project would be designed to replicate predevelopment hydrology. Additional measures to reduce stormwater runoff, such as low-impact development (LID) or other on-site measures, would be considered at a more advanced phase of project development.

Operation of the mainline or test tracks would not be expected to increase nighttime illumination of fish-bearing waters (which could increase the risk of predation on juvenile salmonids). The tracks would have no overhead lighting, and the train headlights would be directed parallel to the tracks. Lighting within the site would be shielded and directed inward toward the site to minimize spillover effects.

Preferred Alternative

The Preferred Alternative would affect approximately 3,050 to 3,100 linear feet of surface-flowing stream. The affected stream segments include approximately 2,450 to 2,500 linear feet of East Fork Hylebos Tributary (depending on whether the 40 mph Alignment or 55 mph Design Option is selected; see below) and approximately 600 linear feet of West Fork Hylebos Tributary (Table 3.10-1). Compared to the South 344th Street Alternative, the Preferred Alternative would affect approximately 400 fewer linear feet of East Fork Hylebos Tributary. But this alternative would impact West Fork Hylebos Tributary, whereas the South 344th Street Alternative would avoid those impacts. Compared to the South 344th Street Alternative, the Preferred Alternative would relocate more of East Fork Hylebos Tributary and would not daylight a segment of that stream near S 344th Street. These impacts are analyzed below.

Approximately 2,450 linear feet of East Fork Hylebos Tributary (surface-flowing) fall within the permanent impact footprint of this alternative. The affected portion of the stream extends from north of S 336th Street to S 344th Street (see Figure G3.4-4 in Appendix G3, Ecosystems Resources Technical Report). Approximately 1,650 feet of the stream channel in this area would be relocated and realigned. The current conceptual design includes meanders and other features to enhance the availability and diversity of aquatic habitats. Based on the conceptual design, the addition of meanders would increase the length of the stream channel in this area by approximately 130 linear feet. The actual layout of the stream channel would be developed by the design-build contractor in consultation with Sound Transit, permitting agencies, and other stakeholders.

Approximately 350 feet of the stream relocation would occur in the OMF site footprint, and approximately 1,300 feet would be associated with the mainline tracks. The relocated stream channel would be approximately 40 to 70 feet west of the mainline tracks. An additional approximately 750 linear feet of the stream would be within the permanent impact footprint but would not be relocated.

Currently, much of East Fork Hylebos Tributary in this area is confined within a straight and narrow channel that lacks complexity. Relocating and realigning the channel could create opportunities to add channel sinuosity and habitat complexity, potentially improving in-stream habitat conditions in some reaches. Large woody debris would be placed in and near the stream channel to restore habitat complexity. The new channel would be designed to maintain flows and water quality conditions.

Sound Transit has committed to minimizing the need to place existing streams in new culverts and has designed the OMF South alternatives to avoid new stream piping whenever possible. Any culvert on potentially fish-bearing streams that must be replaced to accommodate the project would be designed and installed in accordance with WDFW's Water Crossing Design Guidelines (Barnard et al. 2013). Any work below the ordinary high water line of any streams in the study area would be conducted in accordance with the terms of WDFW's Hydraulic Project Approval (HPA), Clean Water Act Section 404 permit, and other applicable permits and reviews.

The current interim design indicates that some of the relocated channel would be routed through a parcel immediately south of the Christian Faith Center property. That parcel is currently unvegetated and is used for storage of heavy equipment and construction materials. Under current conditions, the vegetated riparian area along that stream segment is confined to an approximately 80-foot-wide strip. Upon project completion, the width of the area between the OMF site and the mainline tracks would be approximately 200 feet. It is assumed for this analysis that trees and other woody vegetation would be planted in all allowable areas between the OMF site and the mainline tracks. As a result, a wider area would be available to support riparian functions, but those functions would be limited in some parts of that area because trees and other tall vegetation would not be allowed to grow near the mainline and lead tracks.

Although relocating and realigning the stream channel would have some beneficial effects, changing the physical characteristics of a stream could adversely affect its hydrology and downstream sediment regimes. In addition, the presence of the OMF site to the west and the mainline tracks to the east would further reduce the width of the already limited area available to support riparian functions. From S 336th Street to the southeastern corner of the Christian Faith Center property, the vegetated riparian zone between the OMF site and the mainline tracks would be approximately 180 feet wide. Compared to the existing width of the vegetated riparian zone in this area (200 to 300 feet), under the Preferred Alternative, this zone would amount to a 10 to 40 percent reduction in the width of the existing vegetated riparian zone along approximately 1,400 linear feet of stream channel. Riparian functions in this area would be further reduced by the presence of lead tracks crossing the stream; trees and other tall vegetation would not be allowed to grow near the lead tracks.

Approximately 350 feet south of the Christian Faith Center parcel, the stream would be confined to an approximately 80-foot-wide corridor between the Ellenos Yogurt parcel and I-5. This area would include about 400 linear feet of stream channel. Much of the stream in this area would be beneath or immediately adjacent to the mainline or lead tracks. The presence of support columns near the stream would constrain options for natural or human-created modifications to channel configuration in the future. In addition, existing forested riparian vegetation in this area would be cleared and replaced with low-growing vegetation or converted to hard surfaces, substantially reducing riparian functions along this stream segment.

Downstream of the Ellenos Yogurt parcel, the realigned channel would tie into the channel that would be daylighted as part of the Preferred Alternative. Under this alternative, approximately 420 linear feet of East Fork Hylebos Tributary immediately north of S 344th Street would be removed from a culvert (See Table 3.10-1) and restored to a daylighted channel. Downstream of the daylighted channel, the stream would be conveyed under the 21st Avenue S extension and S 344th Street in a new structure that would replace the existing, approximately 315-foot-long structure. Under current conditions, the stream is conveyed through this area in a 4-foot-diameter corrugated steel pipe that is not considered to be a barrier to fish passage.

The permanent stream buffer impact areas (Table 3.10-1) reflect the assumption that nearly all of the existing forested riparian habitat along the affected stretch of stream would be cleared for construction. It may be possible to retain existing vegetation (including riparian forest) in some areas; the actual extent of riparian clearing and planting would be determined by the design-build contractor in consultation with Sound Transit. Where safety constraints allow, riparian areas for construction would be restored with native vegetation, with an emphasis on trees and shrubs. Trees and other tall vegetation would not be allowed to grow back near the mainline tracks and associated facilities. In those areas, some riparian habitat functions would be restored through revegetation with native shrubs and other low-growing species. In areas where mixed deciduous and coniferous forest is replaced with project features and non-forested vegetation, the capacity of those areas to support riparian functions for East Fork Hylebos Tributary would be permanently reduced. Some riparian habitat functions would be restored through revegetation with native shrubs and other low growing species.

The Preferred Alternative would also affect aquatic and riparian habitats associated with West Fork Hylebos Tributary. The impacts on aquatic habitats are difficult to quantify because the stream lacks a defined channel where it flows through Wetland WFW-02 and an associated in-line stormwater detention facility south of S 336th Street. For this reason, the estimated extent of project-related impacts is based on the linework obtained from the King County iMap interactive mapping tool. That source identifies approximately 600 linear feet of the stream that would fall within the permanent impact footprint of the Preferred Alternative.

Frontage improvements along S 336th Street to meet city standards would necessitate the installation of a replacement structure where West Fork Hylebos Tributary is crossed by the road. The current interim design for that crossing includes a structure that is approximately 3 feet longer than the existing pair of city-owned culverts (see Figure 3.10-2; WDFW ID# 933224) and that has a substantially larger hydraulic opening than the existing culverts. The installation of a single structure with a wider opening at this site would help restore hydrological capacity, allowing sediment and organic debris to pass through and providing fish unhindered passage beneath the roadway. The existing culverts are identified partial barriers to fish passage. The replacement structure would be designed and installed in accordance with WDFW's Water Crossing Design Guidelines (Barnard et al. 2013). As such, the Preferred Alternative could have a beneficial effect on fish passage at this site, if downstream barriers are removed in the future.

As discussed in the analysis of impacts on wetlands (see below), the extension of 18th Place S in the eastern portion of Wetland WFW-02 would reduce the area of the stormwater pond/wetland complex through which the stream flows. In addition, frontage improvements along S 336th Street could necessitate fill in the northern portion of the wetland, further reducing the area of the wetland that supports riparian functions for the West Fork Hylebos Tributary. Mitigation measures for impacts to wetlands are described in Section 3.10.3. Potential impacts to the in-line stormwater detention are discussed in the Final EIS Section 3.11 Water Resources.

Vegetation in and around Wetland WFW-02 supports riparian functions for West Fork Hylebos Tributary. The wetland and its buffer are dominated by forest that provides high-quality riparian habitat. Clearing of these forested areas for extending 18th Place S would permanently reduce their capacity to support riparian functions. See the wetlands analysis below for additional discussion of impacts to this wetland.

The 55 mph Design Option at the northern end of the mainline tracks would affect approximately 50 linear feet more of East Fork Hylebos Tributary than would the 40 mph Alignment (Table 3.10-1). While the 55 mph Design Option would intersect the northern end of the stream in Belmor, the 40 mph Alignment would avoid it altogether.

South 344th Street Alternative

The South 344th Street Alternative would affect approximately 2,850 to 2,900 linear feet of surface-flowing stream (Table 3.10-1). Compared to the Preferred Alternative, this alternative would affect approximately 400 more linear feet of the surface-flowing channel of East Fork Hylebos Tributary but impacts on West Fork Hylebos Tributary would be avoided altogether.

Impacts on East Fork Hylebos Tributary between S 336th Street and the culvert upstream of the WSDOT stormwater facility would be as described above for the Preferred Alternative. South of S 344th Street, approximately 400 linear feet of stream channel would fall within the permanent impact footprint of this alternative. In total, approximately 1,250 feet of the stream impacts would occur in the site footprint, and approximately 1,600 feet would be associated with the mainline tracks (Table 3.10-1). In contrast to the Preferred Alternative, this alternative would not involve the relocation of a short segment of East Fork Hylebos Tributary north of S 336th Street. As a result, this alternative would entail 1,650 linear feet of stream relocation impacts, which would be the same as the Preferred Alternative.

Similar to the Preferred Alternative, the loss of mature, mixed deciduous and coniferous forest would reduce the riparian functions along the affected stream reaches. By affecting reaches downstream of S 344th Street, this alternative would degrade riparian habitat along 400 more feet of the stream than would the Preferred Alternative.

Under this alternative, approximately 420 linear feet of East Fork Hylebos Tributary immediately north of S 344th Street would be removed from a culvert (See Table 3.10-1) and restored to a daylighted channel. Daylighting this segment would increase the amount of functioning aquatic and riparian habitat available in the stream system.

Emergency vehicle access to the mainline tracks would be needed in the daylighted stream location. One of the options under consideration may require approximately 60 feet of channel that is currently culverted (and that would otherwise be daylighted, as described above) to be placed in a new culvert. Because this alternative would not include the extension of 21st Avenue S, the replacement crossing structure south of the daylighted channel would be shorter, compared to the Preferred Alternative. It may be possible to eliminate the need for a culvert through detailed design of the access and of the stream meanders. The design of the emergency vehicle access would need to be coordinated and approved by Sound Transit, WSDOT, and Federal Way.

As with the Preferred Alternative, the 55 mph Design Option at the northern end of the mainline tracks would affect slightly more of East Fork Hylebos Tributary than would the 40 mph Alignment. Under the South 344th Street Alternative, the direct permanent impacts of the tail track design options on streams would be largely identical. The I-5 alignment would affect more stream/wetland buffer along East Fork Hylebos Tributary than would the Enchanted Parkway alignment.

Midway Landfill Alternative

The Midway Landfill Alternative would have no direct impact on streams or stream channels because no streams are present on the Midway Landfill Alternative site. The only project features affecting streams under this alternative relate to stormwater runoff and detention.

Compared with the other alternatives, the Midway Landfill Alternative would convert more pervious land cover to impervious land cover (see Section 3.11.2.2 for additional information about the permeability of the existing membrane cap at the landfill). However, all stormwater runoff from the site would be detained and treated in an underground vault system that would be designed in accordance with Kent Stormwater Manual. The treatment vaults in turn would likely discharge to the on-site regional stormwater treatment and detention facility, which ultimately discharges to the North Fork McSorley Creek approximately 1.1 miles west. As a result, an increase in the area of impervious surface under this alternative would not be expected to adversely affect fish resources, stream hydrology, or aquatic habitat.

Vegetation, Wildlife, and Wildlife Habitat

Long-term impacts on vegetation and wildlife habitat would vary, depending on the affected land cover type. Land cover types include both vegetated areas (e.g., forest, grassland) and developed areas (e.g., commercial, residential). In much of the study area, the replacement of existing impervious surfaces and structures would constitute a minimal change in ecological functions, such as the capacity to support wildlife. The surrounding grass and low-growing vegetation along the alignment would provide some habitat for ground-dwelling small mammals, such as mice and voles.

The severity of impacts on plants and animals would be greater where cover types dominated by native forest — mature native forest in particular — are affected. Removing trees, snags, and understory vegetation would eliminate nesting and foraging sites for birds (including migratory birds), roosting sites for bats, and hiding cover for small mammals. Similarly, impacts on the wetland/stream cover type would have an elevated potential for adverse effects on plants and animals, based on the presence of water and diverse plant communities in many such areas. Alternatives that affect a greater area of these habitat types would have a higher likelihood of adverse effects on vegetation and wildlife. Table 3.10-2 presents a comparison of the build alternatives' potential impacts on vegetation in the study area, based on the amount of each land cover type in the permanent impact footprint.

The severity of impacts would also depend on the type of structure. Construction of the OMF site and at-grade segments of mainline tracks would mean the permanent removal of nearly all vegetation within the permanent impact footprint (although some vegetation would be allowed to grow in landscaped portions of the OMF site). In contrast, as previously discussed, elevated structures that are high enough above the ground would allow for some vegetation to grow underneath.

Operation of OMF South would entail moderate to high levels of human activity and associated noise and light. Notably, all three build alternatives are adjacent to I-5 and are in developed areas with relatively high levels of human activity. In addition to the noise, light, and vehicle traffic on the highway, regular human activity associated with residential, commercial, institutional, and industrial development is a common feature of the landscape throughout the study area. Wildlife that uses habitats in or near the build alternatives is regularly exposed to human activity, noise, and light.

Table 3.10-2 Potential Long-Term Impacts on Vegetation

Alternative	Design Option	Land Cover Type[1]									Total[2]
		Commercial	Residential	Grassland	Invasive Brush	Non native Forest	Mature Native Forest	Other Native Forest	Wetland/Stream	Stormwater Pond	
OMF Site Impacts (acres)											
Preferred	N/A	34	4	4	3	1	11	4	5	1	**68**
South 344th Street	N/A	38	7	4	5	<0.5	6	6	2	2	**70**
Midway Landfill	N/A	9	1	57	1	1	0	4	0	5	**78**
Mainline Impacts[3] (acres)											
Preferred	40 mph Alignment	2	7	<0.5	1	0	3	3	2	<0.5	**18**
	55 mph Design Option	1	8	<0.5	1	0	3	3	2	<0.5	**20**

Table 3.10-2 Potential Long-Term Impacts on Vegetation (continued)

Alternative	Design Option	Land Cover Type[1]									Total[2]
		Commercial	Residential	Grassland	Invasive Brush	Non native Forest	Mature Native Forest	Other Native Forest	Wetland/Stream	Stormwater Pond	
South 344th Street	40 mph Alignment and Enchanted Parkway Tail Track Alignment	2	7	<0.5	2	0	4	6	2	1	**24**
	55 mph Design Option and I-5 Tail Track Alignment	2	8	1	2	0	4	7	2	1	**26**
	55 mph Design Option and Enchanted Parkway Tail Track Alignment	2	8	<0.5	2	0	4	6	2	1	**25**
	40 mph Alignment and I-5 Tail Track Alignment	2	7	<0.5	2	0	4	7	2	1	**24**
Midway Landfill[4]	N/A	N/A	N/A	N/A	N/A	N/A	N/A	N/A	N/A	N/A	**N/A**

Notes:

(1) Land cover types are described in Appendix G3, Ecosystem Resources Technical Report.

(2) The total values for some rows do not equal the sum of the values in the row due to rounding.

(3) If neither the Preferred nor the South 344th Street alternative is selected, the mainline could be constructed later in time if TDLE is constructed as proposed. TDLE is currently under environmental review.

(4) The Midway Landfill Alternative would not include any mainline or test track construction.

If activity or noise levels at the maintenance facility noticeably exceed current conditions, affected animals may be displaced from otherwise suitable habitat, potentially leading to competition with animals that occupy suitable habitat at other sites with less disturbance. Such competition may produce increased stress and decreased reproductive success for affected individuals. Adverse behavioral responses to increased night lighting may have similar consequences. Animals displaced from areas of suitable habitat may be exposed to an elevated risk of predation or vehicle collisions while they are seeking new areas of suitable habitat.

Based on the limited amount of suitable habitat that would be affected under any of the alternatives, the project would not be expected to measurably reduce the regional populations of any wildlife species. None of the build alternatives are within 0.25 mile of a known breeding area or other sensitive site for any wildlife species of concern.

As previously discussed, no ESA-listed plant or wildlife species are known or expected to be present in the study area, and the study area contains no critical habitat for ESA-listed species. As such, none of the OMF South alternatives would have the potential for any adverse effects on ESA-listed species or critical habitat.

Preferred Alternative

The extent of this alternative's effects on the mature native forest, other native forest, and wetland/stream cover types would be greater than the Midway Landfill Alternative and approximately equal to the South 344th Street Alternative. Under this alternative (with either mainline track design option), construction and operation of the facility and mainline tracks would result in permanent impacts on approximately 14 acres of mature native forest, 7 acres of other native forest, and 7 acres of the wetland/stream cover type (Table 3.10-2). Most impacts (11 of 14 acres) on the mature native forest cover type would be associated with the OMF site rather than the mainline tracks. Approximately 5 acres of mature native forest habitat surrounding Wetland WFW-02 would fall within the permanent impact area of the facility, as would approximately 6 acres of this habitat type along the eastern edge of the facility.

Compared with the South 344th Street Alternative, the Preferred Alternative would affect less of the forested wetland and riparian habitats associated with East Fork Hylebos Tributary. The 55 mph Design Option at the northern end of the mainline tracks would not have a noticeably different effect on native forests or wetlands and streams as compared to the 40 mph Alignment (Table 3.10-2).

Based on the prevalence of the commercial and residential cover types on the existing site and in the surrounding study area, OMF South operations at the Preferred Alternative site would probably result in a less noticeable increase in human activity and associated noise and light compared with the Midway Landfill Alternative. By affecting more areas with the native forest and wetland/stream cover types, however, this alternative would likely degrade or eliminate more areas that currently provide resting cover, hiding cover, or travel corridors for wildlife. As such, the potential for long-term behavioral disruption or displacement from suitable habitats may be greater under this alternative than under the Midway Landfill or South 344th Street alternatives.

South 344th Street Alternative

The extent of the South 344th Street Alternative's effects on the native forest and wetland/stream cover types would be similar to but lower than that of the Preferred Alternative (Table 3.10-2). Differences between these two alternatives arise primarily from the exclusion of Wetland WFW-02 and surrounding forested areas from the impact area of the South 344th Street Alternative. Compared to the Preferred Alternative, this alternative would affect fewer acres of the mature native forest (10 acres, compared to 14) and wetland/stream (3 acres, compared to 7) cover types. This alternative would affect 5 to 6 more acres of other native forest than the Preferred Alternative, depending on the tail track design option. Similar to the Preferred Alternative, most of the impacts on mature native forest would be associated with the OMF site, not the mainline tracks.

The impacts of the 55 mph Design Option at the northern end of the mainline tracks would be essentially identical to those of the 40 mph Alignment (Table 3.10-2). At the southern end of the facility, the design options for the tail tracks would have essentially identical impacts on the mature native forest and wetland/stream cover types, while the I-5 alignment would have slightly more impacts on other native forest, compared to the Enchanted Parkway alignment (Table 3.10-2).

Based on the smaller extent of impacts on the native forest and wetland/ stream cover types (and the similar degree of existing development in the study area), this alternative would likely have a lower potential to disturb wildlife over the long term compared with the Preferred Alternative, but greater than the Midway Landfill Alternative.

Midway Landfill Alternative

Compared with the other build alternatives, the Midway Landfill Alternative would have minimal effects on native or complex habitats (i.e., the mature native forest, native forest, and wetland/stream cover types). Most of the permanently affected area consists of the grassland cover type, which supports limited habitat functions that are widely available elsewhere in the study area. Only about 4 acres of other native forest cover would be affected, and no mature native forest or wetland/stream habitats would be affected (Table 3.10-2).

OMF South operations at the Midway Landfill site would result in a greater increase in human activity and associated noise and light compared with the other build alternatives. This is because most of the site is currently fenced to limit access to the landfill. In contrast, the Preferred and South 344th Street alternative sites are surrounded by commercial and residential areas with relatively high levels of human activity. Compared to the other two alternatives, however, the Midway Landfill Alternative would have a lower potential for adverse effects on wildlife because it would affect fewer acres of structurally complex habitat types such as native forests and wetlands.

Wetlands

Filling, excavating, or clearing within wetlands or wetland buffers would diminish wetland functions through the loss of area, changes to surface or subsurface water flows, or long-term changes to vegetation. Project actions that may entail such impacts include construction of buildings, roadways, mainline tracks, lead tracks, or test track (including support columns), train storage areas, retaining walls, parking areas, and stormwater facilities. The wetland impact areas are summarized in Table 3.10-3 below and depicted in Figures G3.4-1 through G3.4-5 in Appendix G3, Ecosystem Resources Technical Report. Wetland buffer impacts are summarized in Table 3.10-4 below.

Table 3.10-3 Potential Long-Term Impacts on Wetlands

Wetland Rating[1]	Alternative		
	Preferred[2]	South 344th Street[2,3]	Midway Landfill
OMF Site Impacts (acres)			
Category II Wetlands	1.8	0	0
Category III Wetlands	0.9	1.4	0
Total OMF Site Impacts	*2.7*	*1.4*	*0*
Mainline Impacts[4,5] (acres)			
Category III Wetlands	1.6	1.5	N/A
Category IV Wetlands	<0.1	<0.1	N/A
Total Mainline Impacts	*1.6*	*1.5*	*N/A*
Total Impacts	***4.3***	***3.0***	***0***

Notes:

(1) Wetland ratings (Hruby 2014) are preliminary and subject to review by permitting authorities.

(2) The impacts of the design options for the curve at the northern end of the mainline tracks would differ by 0.01 acre.

(3) The impacts of the design options for the mainline tracks, including the tail tracks, for the South 344th Street Alternative would differ by 0.01 acre; see Table 3.10-6 for details.

(4) If neither the Preferred nor the South 344th Street alternative is selected, the mainline could be built later in time if TDLE is constructed as proposed. TDLE is currently under environmental review.

(5) The test track is included in the Preferred Alternative and the South 344th Street Alternative but not the Midway Landfill Alternative.

Table 3.10-4 Potential Long-Term Wetland Buffer Impacts

Alternative/Mainline Design Option		Wetland Buffer Impacts (acres)[1]	Affected Wetland Buffers
OMF Site Impacts[2]			
Preferred		7.8	WFW-01, WFW-02, WFW-03, WFW-04, WFW-15
South 344th Street		6.3	WFW-01, WFW-03, WFW-04, WFW-06, WFW-11, WFW-13, WFW-15, WFW-17, WFW-18
Midway Landfill		0	N/A
Mainline Impacts[3,4]			
Preferred	With 40 mph Alignment	4.7	WFW-01, WFW-03, WFW-04, WFW-06, WFW-11, WFW-13, WFW-15, WFW-32
	With 55 mph Design Option	5.1	WFW-01, WFW-03, WFW-04, WFW-06, WFW-07, WFW-11, WFW-13, WFW-15
South 344th Street	With 40 mph Alignment and Enchanted Parkway Tail Track Alignment	7.0	WFW-01, WFW-03, WFW-04, WFW-05, WFW-06, WFW-11, WFW-13, WFW-15, WFW-17, WFW-32
	With 55 mph Design Option and I-5 Tail Track Alignment	7.2	WFW-01, WFW-03, WFW-04, WFW-05, WFW-06, WFW-07, WFW-11, WFW-13, WFW-15, WFW-17
	With 55 mph Design Option and Enchanted Parkway Tail Track Alignment	7.2	WFW-01, WFW-03, WFW-04, WFW-05, WFW-06, WFW-07, WFW-11, WFW-13, WFW-15, WFW-17
	With 40 mph Alignment and I-5 Tail Track Alignment	7.0	WFW-01, WFW-03, WFW-04, WFW-05, WFW-06, WFW-11, WFW-13, WFW-15, WFW-17, WFW-32
Midway Landfill	N/A	N/A	N/A

Notes:

(1) Impact numbers presented in this table represent all affected areas inside functional wetland buffers, including areas that overlap with stream area and stream buffers; therefore, this table likely overestimates the extent of buffer impact areas. Stream areas, defined by the ordinary high water line, are excluded from wetland buffer areas.

(2) For both the Preferred and S 344th Street Alternatives, there is only one site design; therefore, only one set of impact values is presented for the OMF site.

(3) If neither the Preferred nor the South 344th Street alternative is selected, the mainline could be built later in time if TDLE is constructed as proposed. TDLE is under environmental review.

(4) The test track is included in the Preferred Alternative and the South 344th Street Alternative but not the Midway Landfill Alternative.

Not all wetlands underneath elevated structures, such as the lead, test, and mainline tracks, would be permanently filled. However, trees and other tall vegetation would not be allowed to grow near track segments. This would result in the permanent conversion from trees and tall shrubs to short-statured shrubs and herbaceous vegetation. In addition, the long-term presence of structures above vegetation would reduce the amount of sunlight and precipitation the plants receive, potentially making these areas more sparsely vegetated. Also, the interception of precipitation by overhead structures could have the potential for long-term impacts on wetland hydrology. For any given wetland, the degree of those impacts would depend on the proportion of the wetland that is affected as well as the extent to which precipitation contributes to wetland hydrology at that site.

Preferred Alternative

The Preferred Alternative would have the greatest extent of long-term impacts on wetlands and wetland buffers among the build alternatives largely due to the construction of the OMF site and associated roadways, including the extensions of 21st Avenue S and 18th Place S (Tables 3.10-3 and 3.10-4). Approximately 60 percent of the area of long-term impacts on wetlands under this alternative would result from construction of the OMF site. A large proportion of the total wetland impact area (nearly 40 percent) would occur in Wetland WFW-02, a Category II forested wetland that is associated with West Fork Hylebos Tributary and contained within a stormwater facility in the northwestern portion of the OMF site footprint (see Table G3.4-7 and Figure G3.4-4 in Appendix G3, Ecosystem Resources Technical Report for more detail). The extension of 18th Place S and the construction of a bike/pedestrian pathway to meet local code requirements would require wetland fill and retaining walls in the eastern portion of this wetland. These impacts would reduce wetland habitat and functions, as well as reducing wetland buffer functions. Sound Transit is exploring options to further avoid and minimize impacts on wetlands during the design development process, if feasible.

Most of the other wetlands that fall within the permanent impact footprint for the Preferred Alternative (or have buffers that do) are riverine wetlands associated with East Fork Hylebos Tributary. Others are depressional or slope wetlands within or near the I-5 right-of-way.

Similar to direct impacts on wetlands, impacts on wetland buffers would occur primarily at the OMF site. The permanent impact footprint of the site would overlap 7.6 acres of wetland buffer, while that of the mainline tracks overlaps 4.7 to 5.0 acres of buffer (Table 3.10-4).

Impacts on Wetland WFW-07 would vary with the track design option at the northern end of the mainline tracks. The 55 mph Design Option would intersect a small portion (less than 0.05 acre) of that wetland and its buffer; the 40 mph Alignment would avoid it, and its buffer, altogether.

South 344th Street Alternative

The extent of long-term impacts on wetlands under the South 344th Street Alternative would be less than under the Preferred Alternative, primarily because the OMF site would not impact Wetland WFW-02. This alternative would have 3.0 acres of permanent impacts on wetlands, compared to 4.1 acres under the 336th Street Alternative (Table 3.10-3). The impacts of the mainline tracks would be similar in scale to those of the Preferred Alternative.

The direct long-term impacts of the mainline track design options on wetlands would be essentially identical. As under the Preferred Alternative, the 40 mph Alignment would avoid long-term impacts on Wetland WFW-07 and its buffer. Neither of the tail track options would have any direct impacts on wetlands, and their impacts on wetland buffers would be essentially identical.

Compared to the Preferred Alternative, the long-term buffer impact footprint of the site is slightly smaller (6.8 acres, compared to 7.6 acres), while the impacts of the mainline tracks would be greater due to the tail tracks (6.8 to 7.0 acres, compared to 4.7 to 5.0 acres; see Table 3.10-4).

Midway Landfill Alternative

The Midway Landfill Alternative would have no long-term impacts on wetlands because there are no regulated wetlands or wetland buffers within the temporary or permanent impact footprints of this alternative.

3.10.2.3 Construction Impacts

Temporary construction-related impacts would occur where wetlands, wetland buffers, streams, stream buffers, or native forest are affected by clearing, grading, and ground-disturbing work but are revegetated following construction. The temporary impacts of OMF South construction on ecosystem resources are described below. For each ecosystem component, the impacts common to all alternatives are described first, followed by comparisons of the effects of the alternatives.

Aquatic Species and Habitat

Temporary construction-related impacts on aquatic resources would occur where stream buffers are affected by clearing, grading, and ground-disturbing work but are revegetated following construction. In addition to impacts on riparian vegetation, temporary impacts on stream habitats would occur if streams were diverted or placed in temporary pipes. Also, ground-disturbing work and equipment use in or near surface-flowing waters would present the risk of delivering sediment or contaminants (e.g., fuel, hydraulic fluids) to streams, temporarily degrading water quality. The risk of adverse effects would be minimized through the implementation of BMPs during construction and post-construction restoration. Temporary, construction-related impacts on streams and stream buffers are summarized in Table 3.10-5.

The duration of such impacts would vary, depending on the existing condition of the affected area. Where clearing affects low-growing vegetation (e.g., grasses, herbaceous species) or invasive species, the riparian functions of the disturbed areas would likely be restored within one growing season of clearing and replanting. Where invasive species are cleared and replaced with native species, riparian functions may be improved. In contrast, temporary impacts on woody vegetation generally last longer because trees and/or shrubs may require several years or decades to achieve the size and stature necessary to provide preconstruction functions, such as shade and large woody debris recruitment.

Preferred Alternative

Most of the Preferred Alternative's impacts on aquatic resources (including impacts associated with the OMF site, mainline, lead, and test tracks) would be long-term and are discussed in Section 3.10.2.2. Approximately 500 linear feet of East Fork Hylebos Tributary would fall within the temporary impact footprint (250 linear feet for the OMF site and 250 feet along the mainline tracks; see Table 3.10-5). Impacts would include temporary loss of riparian habitat function and an elevated risk of water quality degradation, as described above. Site construction would temporarily affect approximately 1.4 acre of stream buffer habitat along East Fork Hylebos Tributary, and mainline track construction would affect approximately 2.2 acres.

Similar to permanent impacts, direct temporary impacts on West Fork Hylebos Tributary are difficult to quantify because the stream lacks a defined bed and bank in most of the study area. As with the analysis of permanent impacts, the estimated extent of project-related impacts is based on the linework obtained from the King County iMap interactive mapping tool. No part of the line representing West Fork Hylebos Tributary south of S 336th Street falls within the temporary impact footprint of the Preferred Alternative. North of S 336th Street, approximately 50 linear feet of the mapped stream channel fall within the temporary impact footprint. Project construction is anticipated to have temporary impacts on the stream, such as temporary loss of riparian habitat function and an elevated risk of water quality degradation, as described above. During construction of frontage improvements along S 336th Street and installation of a replacement structure where the stream is crossed by the road, a small segment of the stream would likely be placed in a temporary bypass while construction is underway.

Table 3.10-5 Potential Temporary (Construction-Related) Impacts on Aquatic Resources

Alternative	Design Option	Project Element	Stream[1]	Stream Impact (linear feet)[2]	Total Stream Impact per Alternative	Stream Buffer Impact (acres)[3]	Total Stream Buffer Impact per Alternative (acres)
Preferred	40 mph Alignment	Site	East Fork Hylebos Tributary	250	550	1.4	6.5
			West Fork Hylebos Tributary[4]	50		2.9	
		Mainline[5]	East Fork Hylebos Tributary	250		2.2	
	55 mph Design Option	Site	East Fork Hylebos Tributary	250	650	1.4	7.2
			West Fork Hylebos Tributary[4]	50		2.9	
		Mainline[5]	East Fork Hylebos Tributary	350		2.9	
South 344th Street	40 mph Alignment and Enchanted Parkway Tail Track Alignment	Site	East Fork Hylebos Tributary	50	900	0.1	4.4
		Mainline[5]		850		4.3	
	55 mph Design Option and I-5 Tail Track Alignment	Site	East Fork Hylebos Tributary	50	1,050	0.1	4.7
		Mainline[5]		1,000		4.6	
	55 mph Design Option and Enchanted Parkway Tail Track Alignment	Site	East Fork Hylebos Tributary	50	1,050	0.1	5.1
		Mainline[5]		1,000		5.0	
	40 mph Alignment and I-5 Tail Track Alignment	Site	East Fork Hylebos Tributary	50	900	0.1	3.9
		Mainline[5]		850		3.8	
Midway Landfill	N/A	N/A	N/A	0	0	0	0

Notes:

(1) Both affected streams are Type F, per WAC 222-16-030.

(2) Includes the total length of surface-flowing stream within the temporary (construction-related) impact footprint defined for this analysis.

(3) Values presented in this table represent all affected areas inside functional stream buffers, including areas that overlap with wetland buffers.

(4) The portion of this stream in the study area lacks a defined bed and bank where it flows through Wetland WFW-02. Direct impacts on the stream are considered permanent and are discussed above. Temporary impacts on the stream buffer are calculated as the affected area of Wetland WFW-02, plus the area of temporary impacts on the stream's buffer north of S 336th Street. See text for further discussion.

(5) If neither the Preferred nor the South 344th Street alternative is selected, the mainline could be built later in time if TDLE is constructed as proposed. TDLE is currently under environmental review.

Vegetation in and around Wetland WFW-02 supports riparian functions for West Fork Hylebos Tributary. As with the analysis of permanent impacts, temporary impacts on the stream buffer in that area are identified for this analysis as the extent of temporary impacts on Wetland WFW-02 (approximately 2.7 acres). An additional 0.2 acre of this stream's buffer north of S 336th Street (i.e., outside of Wetland WFW-02) also fall within the temporary impact footprint.

The temporary impact footprint of the 55 mph Design Option at the northern end of the mainline tracks would overlap approximately 100 linear feet more of East Fork Hylebos Tributary than would the 40 mph Alignment (Table 3.10-5).

South 344th Street Alternative

Mainline track construction for the South 344th Street Alternative would temporarily affect between approximately 850 and 1,000 linear feet of East Fork Hylebos Tributary, depending on the design option (Table 3.10-5). Site construction would temporarily affect approximately 0.1 acre of stream buffer habitat along East Fork Hylebos Tributary, and mainline track construction would affect approximately 3.8 to 5.0 acres, depending on the design option. This alternative would have no temporary impacts to West Fork Hylebos Tributary.

As with the Preferred Alternative, the 40 mph Alignment at the northern end of the mainline tracks would have a smaller construction-related impact on the northern end of East Fork Hylebos Tributary, compared to the 55 mph Design Option (Table 3.10-5). The direct temporary impacts of the tail track design options on streams would be identical. The Enchanted Parkway alignment, however, would affect approximately 0.4 acre more stream/wetland buffer along East Fork Hylebos Tributary than would the I-5 alignment (Table 3.10-5).

Midway Landfill Alternative

The Midway Landfill Alternative would have no temporary construction-related impacts on aquatic resources.

Vegetation, Wildlife, and Wildlife Habitat

Construction-related impacts on terrestrial resources would include temporary loss or degradation of terrestrial habitats as well as disturbance due to construction-related noise, light, and human activity. The duration of temporary impacts would vary depending on the type of vegetation that is affected. Impacts on grasses and areas dominated by fast-growing invasive species would generally be short-lived, with functions typically returning to pre-impact performance within one growing season. In contrast, temporary impacts on woody vegetation generally last longer because trees and/or shrubs require several years or decades to achieve the size and stature necessary to provide pre-impact functions, such as canopy habitat. Table 3.10-6 presents a comparison of the build alternatives' potential construction impacts on vegetation in the study area, based on the amount of each land cover type in the temporary impact footprint. Land cover types include both vegetated areas (e.g., forest, grassland) and developed areas (e.g., commercial, residential).

Areas cleared for construction would be susceptible to colonization by noxious weeds and other invasive plants. The risk of colonization would be proportional to the amount of area temporarily disturbed by construction; an alternative with a greater extent of ground disturbance would pose a higher risk of contributing to the establishment or spread of noxious weeds and invasive plants.

In disturbed areas, any of the build alternatives would provide the opportunity to temporarily reduce invasive species, such as Himalayan blackberry, through vegetation removal. In some areas, noxious weeds may be eradicated because cover types dominated by invasive species would be converted to landscaping and other areas where invasive species would be controlled. In areas where invasive species are replaced with native species, construction-related impacts may result in improved habitat function.

Table 3.10-6 Potential Temporary (Construction-Related) Impacts on Vegetation

Alternative	Design Option	Land Cover Type[1]									
		Commercial	Residential	Grassland	Invasive Brush	Non native Forest	Mature Native Forest	Other Native Forest	Wetland /Stream	Stormwater Pond	Total[2]
OMF Site Impacts (acres)											
Preferred	N/A	8	2	<0.5	1	<0.5	<0.5	1	<0.5	1	**13**
South 344th Street	N/A	1	0	<0.5	0	<0.5	<0.5	<0.5	<0.5	0	**1**
Midway Landfill	N/A	1	<0.5	2	2	0	0	1	0	<0.5	**7**
Mainline Impacts[3] (acres)											
Preferred	40 mph Alignment	13	6	2	3	0	2	6	<0.5	1	**33**
	50 mph Design Option	13	6	3	3	0	2	6	<0.5	1	**34**
South 344th Street	40 mph Alignment and Enchanted Parkway Tail Track Alignment	16	6	3	3	0	2	11	<0.5	1	**42**
	55 mph Design Option and I-5 Tail Track Alignment	17	6	5	3	0	2	10	<0.5	1	**42**
	55 mph Design Option and Enchanted Parkway Tail Track Alignment	16	6	5	3	0	2	11	<0.5	1	**43**
	40 mph Alignment and I-5 Tail Track Alignment	16	6	3	3	0	2	10	<0.5	1	**41**
Midway Landfill[4]	N/A	N/A	N/A	N/A	N/A	N/A	N/A	N/A	N/A	N/A	**N/A**

Notes:

(1) Land cover types are described in Appendix G3, Ecosystem Resources Technical Report.

(2) The total values for some rows do not equal the sum of the values in the row due to rounding.

(3) If neither the Preferred nor the South 344th Street alternative is selected, the mainline could be built later in time if TDLE is constructed as proposed. TDLE is under environmental review.

(4) The Midway Landfill Alternative would not include any mainline or test track construction.

Preferred Alternative

The temporary impact footprint for this alternative includes a large amount of clearing at the northern end of the mainline tracks to accommodate staging, stockpiling, and other construction activities (see Figure G3.4-9 in Appendix G3, Ecosystem Resources Technical Report). Most of the affected area would consist of the commercial or residential cover types (Table 3.10-6).

The total extent of temporary construction-related impacts on the other native forest cover type would be less than that of the South 344th Street Alternative and greater than the

Midway Landfill Alternative (Table 3.10-6). Nearly all temporary impacts on vegetation would be associated with construction of the mainline and test tracks, not the OMF site. The associated potential for temporary loss or degradation of terrestrial habitats and disturbance of sensitive wildlife species during construction would thus be slightly lower than that of the South 344th Street Alternative. The temporary impacts of the Preferred and the South 344th Street alternatives on the mature native forest and wetland/stream cover types would be essentially identical. However, it may take several years for the forested vegetation communities and several decades for the mature forested community to return to their preconstruction habitat function.

Based on the total extent of temporary, construction-related impacts, the risk of contributing to the establishment and spread of noxious weeds and invasive plants would be slightly greater than that of the South 344th Street Alternative and substantially greater than that of the Midway Landfill Alternative.

The 40 mph Alignment for the mainline and test tracks would have a slightly larger area of temporary impacts compared to the 55 mph Design Option (Table 3.10-6). This difference reflects areas at the northern end of the mainline track segment that would be permanently impacted under the 55 mph Design Option but only temporarily impacted under the 40 mph Alignment.

South 344th Street Alternative

Similar to the Preferred Alternative, the temporary impact footprint for this alternative includes a large amount of clearing at the northern end of the mainline tracks to accommodate staging, stockpiling, and other construction activities. In addition, the temporary impact footprint for this alternative extends farther south than that of the Preferred Alternative, affecting areas around the I-5/SR 18 interchange (see Figure G3.4-11 and Figure G3.4-12 in Appendix G3, Ecosystem Resources Technical Report). As a result, the total extent of temporary, construction-related impacts under the South 344th Street Alternative would be greater than either of the other build alternatives. As with the Preferred Alternative, most of the affected area would consist of the commercial or residential cover types (Table 3.10-6).

The temporary impacts of the Preferred and the South 344th Street alternatives on the mature native forest and wetland/stream cover types would be essentially identical, as would the associated potential for temporary loss or degradation of terrestrial habitats and disturbance of sensitive wildlife species during construction. The total extent of temporary, construction-related impacts — and the associated risk of contributing to the establishment and spread of noxious weeds and invasive plants — would be slightly less than that of the Preferred Alternative (Table 3.10-6).

For the same reasons as described for the Preferred Alternative, the 55 mph Design Option for the curve at the northern end of the mainline tracks would have a slightly smaller area of temporary impacts compared to the 40 mph Alignment. At the southern end of the facility, the design options for the tail tracks would have essentially identical temporary impacts on the mature native forest and wetland/stream cover types. The Enchanted Parkway alignment would have slightly more impacts on other native forest compared to the I-5 alignment (Table 3.10-6).

Midway Landfill Alternative

The extent of temporary construction-related impacts would be substantially smaller under the Midway Landfill Alternative than under the other build alternatives (Table 3.10-6). Also, much less of the other native forest cover type (and no mature forest or and wetland/stream) is within the temporary impact area of this alternative compared to the other two build alternatives. As such, this alternative would have the lowest potential for temporary loss or degradation of terrestrial habitats and disturbance of sensitive wildlife species during construction.

Based on the small size of the temporary disturbance area, this alternative would have the lowest risk of contributing to the establishment and spread of noxious weeds and invasive plants.

Wetlands

Temporary impacts on wetland resources may include reduction or alteration of wetland area, soils, hydrology, and/or vegetation. Construction-related dewatering may temporarily alter groundwater discharge to wetlands. Wetland and wetland buffer functions could also be impacted by soil compaction, accidental spills of hazardous substances, noise and other human-caused disturbance, sedimentation, and introduction of invasive species. Impact areas are summarized in Table 3.10-7. Temporary impacts on wetland buffers are summarized in Table 3.10-8.

Table 3.10-7 Potential Temporary (Construction-Related) Impacts on Wetlands

Wetland Rating[1]	**Alternative**		
	Preferred	**South 344th Street**	**Midway Landfill**
OMF Site Impacts			
Category II Wetlands	2.7	0	0
Category III Wetlands	0.3	0	0
Category IV Wetlands	<0.05	0	0
Total Site Impacts	*3.0*	*0*	*0*
Mainline Impacts[2, 3]			
Category III Wetlands	<0.05	0.3	N/A
Category IV Wetlands	<0.05	<0.05	N/A
Total Mainline Impacts	*0.1*	*0.3*	*N/A*[4]
Total Impacts			
Total Impacts	***3.0 - 3.1***[2]	***0.3***	***0***

Notes:

(1) Wetland ratings (Hruby 2014) are preliminary and subject to review by permitting authorities.

(2) Under either the Preferred Alternative or the South 344th Street Alternative, the impacts of the design options for the curve at the northern end of the mainline tracks would differ by less than 0.05 acre. For the Preferred Alternative, this difference causes the total impact area to round to 3.1 acres or 3.2 acres, depending on the design option. See text for details. The tail track design options for the South 344th Street Alternative would have identical impacts on wetlands.

(3) If neither the Preferred nor the South 344th Street alternative is selected, the mainline could be built if TDLE is constructed as proposed. TDLE is currently under environmental review.

(4) The Midway Landfill Alternative would not include any mainline or test track construction.

The duration of temporary impacts on wetlands would vary, depending on the type of vegetation that is affected. For instance, temporary impacts on emergent wetlands would generally be short-lived, with functions typically returning to pre-impact levels within one growing season. Where invasive species are replaced with native species, construction-related impacts may result in improved habitat function. In contrast, temporary impacts on woody vegetation generally last longer because trees and/or shrubs may require several years or decades to achieve the size and stature necessary to provide pre-impact functions, such as canopy habitat.

Table 3.10-8 Potential Temporary (Construction-Related) Impacts on Wetland Buffers

Alternative/Mainline Design Option		Wetland Buffer Impacts (acres)[1]	Affected Wetland Buffers[2]
OMF Site Impacts			
Preferred		1.7	WFW-02, WFW-04, WFW-14, WFW-15, WFW-18, WFW-33
South 344th Street		0	N/A
Midway Landfill		0	N/A
Mainline Impacts[3]			
Preferred	With 40 mph Alignment	3.5	WFW-01, WFW-03, WFW-04, WFW-06, WFW-10a, WFW-11, WFW-12, WFW-13, WFW-15, WFW-16, WFW-32
	With 55 mph Design Option	4.1	WFW-01, WFW-03, WFW-04, WFW-06, WFW-07, WFW-10a, WFW-11, WFW-12, WFW-13, WFW-15, WFW-16, WFW-32
South 344th Street	With 40 mph Alignment and Enchanted Parkway Tail track Alignment	3.9	WFW-01, WFW-03, WFW-05, WFW-06, WFW-10a, WFW-11, WFW-12, WFW-13, WFW-15, WFW-16, WFW-22, WFW-32
	With 55 mph Design Option and I-5 Tail Track Alignment	4.6	WFW-01, WFW-03, WFW-05, WFW-06, WFW-07, WFW-10a, WFW-11, WFW-12, WFW-13, WFW-15, WFW-16, WFW-22, WFW-32
	With 55 mph Design Option and Enchanted Parkway Tail track Alignment	4.6	WFW-01, WFW-03, WFW-05, WFW-06, WFW-07, WFW-10a, WFW-11, WFW-12, WFW-13, WFW-15, WFW-16, WFW-22, WFW-32
	With 40 mph Alignment and I-5 Tail Track Alignment	4.0	WFW-01, WFW-03, WFW-05, WFW-06, WFW-10a, WFW-11, WFW-12, WFW-13, WFW-15, WFW-16, WFW-22, WFW-32

Notes:

(1) Values presented in this table represent all affected areas inside functional wetland buffers, including areas that overlap with stream area and stream buffers.

(2) Wetland WFW-07 buffer is only impacted by the 55 mph Design Option.

(3) If neither the Preferred nor the South 344th Street alternative is selected, the mainline could be built later in time if TDLE is constructed as proposed. TDLE is currently under environmental review.

Preferred Alternative

Overall, construction-related impacts on wetlands under the Preferred Alternative would be greater than under the South 344th Street Alternative (Table 3.10-7), primarily because this alternative would affect Wetland WFW-02 while the South 344th Street Alternative would not. Other temporary impacts on wetlands would result from construction roadway extension as part of the site and of the mainline. Construction of the OMF site and the mainline tracks would also temporarily affect the buffers of several wetlands (Table 3.10-8).

The direct temporary impacts of the design options for the curve at the northern end of the mainline tracks would be essentially indistinguishable. The design options would differ in their impacts on wetland buffers, with the 40 mph Alignment having fewer buffer impacts by avoiding the buffer of Wetland WFW-07 as compared to the 55 mph Design Option (Table 3.10-8).

South 344th Street Alternative

Construction of the South 344th Street Alternative site would not cause any temporary impacts on wetlands or wetland buffers; all temporary impacts would be associated with mainline track construction (Table 3.10-7). Only three wetlands under this alternative would be impacted by construction-related activities. The total extent of temporary, construction-related impacts (OMF site and mainline tracks combined) would be substantially less than under the Preferred Alternative, primarily because this alternative would not impact Wetland WFW-02, and it would not have any temporary impacts on Wetland WFW-04. As with the Preferred Alternative, the 40 mph Alignment also avoids the buffer of Wetland WFW-07 and would have fewer construction-related impacts than 55 mph Design Option at its northern end. There are no temporary wetland impacts from the tail track design options for the South 344th Street Alternative, but the buffers of Wetlands WFW-17 and WFW-05 would receive some impacts (see Figures G3.4-5 and G3.4-6 in Appendix G3, Ecosystem Resources Technical Report).

Midway Landfill Alternative

The Midway Landfill Alternative would have no temporary construction-related impacts on wetlands because no regulated wetlands or wetland buffers fall within the temporary impact footprint of this alternative.

3.10.2.4 Avoidance and Minimization of Impacts

The avoidance and minimization of impacts to ecosystem resources was a guiding principle in the preliminary design of the build alternatives. The development of the design for OMF South was strongly influenced by the presence and location of wetlands, habitat features, vegetation conditions, and the potential presence of fish and wildlife. During the conceptual design phase, the project design was adjusted to avoid and minimize impacts on streams, riparian areas, wetlands (Wetland WFW-02 in particular), and areas of mature native forest, particularly along East Fork Hylebos Tributary. For example, the design of the Preferred Alternative includes retaining walls along the eastern and northwestern boundaries of the OMF site to minimize impacts on streams and associated wetlands in those areas. In addition, the OMF site in the Preferred Alternative was shifted west to widen the corridor available for stream restoration.

Additional avoidance and minimization measures will be implemented, as practicable, as project design continues to develop. Sound Transit is exploring options for reducing impacts on West Fork Hylebos Tributary without jeopardizing the operability of the Preferred Alternative. In addition, Sound Transit has committed to minimizing the need to place existing streams in new culverts and has designed the OMF South alternatives to avoid new stream piping whenever possible. However, two to three culverts may need to be replaced as part of the Preferred Alternative, and these replaced culverts, which may be longer, would be made fish passable. Relocated stream segments would be designed to include meanders (where space allows) and other features that would enhance the availability and diversity of aquatic habitats over the long term. Examples of additional measures include minimizing vegetation clearing, restoring temporarily affected areas, and preparing and implementing a revegetation plan.

Sound Transit would restrict clearing activities during the active bird nesting period, to the extent possible, to comply with the Migratory Bird Treaty Act administered by USFWS. If avoidance scheduling is infeasible, Sound Transit would conduct pre-construction surveys to determine the presence or absence of nesting migratory birds to assist in complying with the Migratory Bird Treaty Act.

Sound Transit would comply with standard specifications, BMPs, and applicable federal, state, and local mitigation requirements during design, construction, and post-construction activities. Sound Transit would meet all regulatory requirements and continue to implement proactive avoidance and minimization measures related to these BMPs in adherence with federal, state, and local regulations.

3.10.2.5 Indirect Impacts

For aquatic species and habitat, indirect impacts would be minimal because the surrounding areas are already heavily developed. The construction and operation of OMF South should not interfere with future projects that may provide habitat improvements, such as road projects that may improve fish passage or projects that may enhance vegetated and wetland areas in the project corridor. OMF South would be designed to ensure that it would not preclude future culvert replacement(s) by WSDOT to provide fish passage. Facilities that provide water quality treatment could minimize long-term indirect impacts on water quality in streams that provide habitat for fish sensitive to the toxic effects of contaminants in stormwater runoff. However, as discussed in the analysis of long-term impacts, treated water discharged from such facilities and untreated water that bypasses those facilities during major storm events may contain contaminants that can harm fish and other aquatic life.

Long-term indirect impacts on vegetation, wildlife, and wildlife habitat could include habitat loss or increased disturbance due to changes in land use patterns near the OMF South alternatives. Such impacts would be unlikely under any of the build alternatives, however, because OMF South is not anticipated to influence surrounding land uses, and all three site alternatives are in areas that are highly developed.

Indirect impacts from OMF South may result in long-term wetland degradation from stormwater discharges and alterations in wetland hydrology. Impacts to wetland hydrology would be minimized through the use of stormwater management facilities that meet the standards established by local, state, and federal agencies with regulatory authority. Facilities that provide water quality treatment could minimize long-term indirect impacts on water quality in wetlands. However, as discussed in the analysis of long-term impacts, treated water discharged from such facilities and untreated water that bypasses those facilities during major storm events may contain contaminants that can harm fish and other aquatic life.

3.10.3 Mitigation Measures

Construction of either the Preferred Alternative or the South 344th Street Alternative would have unavoidable impacts on ecosystem resources. On-site restoration would be undertaken to offset temporary construction impacts. Examples of such restoration activities include restoring in-stream habitat with large woody debris and planting temporarily disturbed wetlands and riparian buffers with native species. As the project design is advanced, Sound Transit would work with Tribes and permitting agencies to identify mitigation needs and opportunities. For unavoidable long-term impacts on streams and stream buffers, Sound Transit would develop a compensatory mitigation plan during the permitting phase in accordance with applicable federal, state, and local requirements and guidelines. Impacts on streams would be mitigated through restoration actions developed in collaboration with federal, state, local, and Tribal biologists.

Sound Transit has committed to achieving no net loss of wetland function and area on a project-wide basis. For unavoidable long-term impacts on wetlands and wetland buffers, Sound Transit would develop a compensatory mitigation plan during the permitting phase in accordance with applicable federal, state, and local requirements and guidelines. These guidelines and regulatory standards include the 2008 Federal Compensatory Mitigation Rule (Title 40 Code of Federal Regulations [CFR] § 230 and 33 CFR § 325 and 332.), interagency guidance contained in Wetland Mitigation in Washington State (Ecology et al. 2021, or as updated), and the applicable local critical areas ordinances. Sound Transit could use a combination of mitigation strategies to achieve no net loss of wetland function and area, such as off-site compensatory mitigation within the Hylebos Creek watershed, mitigation bank, and/or in-lieu fee program.

Compensatory mitigation would be provided for construction impacts lasting more than one growing season and for permanent conversion of wetlands from one vegetation type to another (e.g., forested wetland to emergent or scrub-shrub wetland) as well as for indirect impacts on wetlands. In areas where stream buffers and wetland buffers overlap, mitigation for impacts would be based on the local jurisdiction's requirements for mitigating impacts either to wetland buffers or to stream buffers — whichever requirements are more stringent.

In cooperation with resource agencies and Tribes, Sound Transit would develop plans to mitigate the effects of the project on wetlands, streams, riparian corridors, and regulatory buffers on a watershed basis. To the extent possible, off-site compensatory mitigation sites would be identified and would compensate for lost values in kind. Potential off-site mitigation areas are identified in Appendix G.3, Ecosystems Technical Report. These or other areas may be used for off-site mitigation. It may be necessary to use several sites and Sound Transit does not anticipate the need to implement mitigation to compensate for diminished habitat functions due to impacts on vegetation outside of streams, wetlands, and their buffers.

The 2008 Federal Compensatory Mitigation Rule established a preference for the use of approved wetland mitigation banks and in-lieu fee programs over the development of permittee-responsible mitigation sites (40 CFR § 230 and 33 CFR § 325 and 332). The study area is located within the service areas of one mitigation bank (the Port of Tacoma's Upper Clear Creek mitigation bank, certified in June 2020) and one in-lieu fee program (the King County Mitigation Reserves Program).

3.11 Water Resources

This section discusses potential impacts of the OMF South project alternatives on water resources, which includes surface waters, stormwater utilities, shorelines, floodplains, and groundwater. The amount of stormwater runoff to surface waters and infiltration to groundwater that occurs in a basin is controlled in part by the types of soil and land cover that are present, which are also discussed.

Federal Way and Kent are Phase II permittees under Ecology's National Pollutant Discharge Elimination System (NPDES) Municipal Stormwater General Permit (Ecology 2017). The permit requires compliance with BMPs for design related to flow control and water quality as outlined in the Stormwater Management Manual for Western Washington (Ecology 2019) or equivalent manuals. Federal Way and Kent have each adopted the King County Surface Water Design Manual (King County 2016a) and the King County Stormwater Pollution Prevention Manual (King County 2016b), and each city has included amendments to meet their respective needs (City of Federal Way 2017; City of Kent 2017). A list of regulations applicable to water resources in the study area is provided in Appendix H5, Water Resources Technical Appendix.

3.11.1 Affected Environment

The affected environment includes the surface water, shorelines, stormwater, floodplains, and groundwater resources in the study area, as shown in Figures 3.11-1 and 3.11-2. The Preferred and South 344th Street alternatives are in Water Resource Inventory Area 10, the Puyallup-White Watershed, as designated by WDNR. The Midway Landfill Alternative is in Water Resource Inventory Area 9, the Green/Duwamish and Central Puget Sound Watersheds.

Natural Water Bodies

The Preferred and South 344th Street alternatives discharge to two tributaries in the Hylebos Creek basin in the Puyallup–White Watershed, while the surface waters in the Midway Landfill Alternative study area discharge to the urban stream basin of McSorley Creek in in the Lower Puget Sound–Des Moines/Federal Way Watershed (Figures 3.11-1 and 3.11-2). The surface streams in the study area are each part of a drainage system that ultimately discharges to Puget Sound. Only streams in the immediate vicinity of the alternatives or those receiving surface flows from the sites will be discussed here. Details regarding streams, typing, and classification are presented in Section 3.10, Ecosystem Resources.

The surface waters in the study area have been historically impacted by urbanization, and all the streams have reaches that are either piped within stormwater facilities or are confined within straight and narrow channels that lack complexity. The industrial and urban development in the study area has prompted restoration efforts to protect water quality and wildlife habitat. The following sections describe each water body in the study area and identify those designated as impaired on the Water Quality Assessment Clean Water Act Section 303(d) list. Table 3.11-1 identifies water quality impairments and the documented floodplains associated with each stream. Discussion of fish species that may currently be present in stream reaches within and downstream of the study area is presented in Section 3.10.1.1, Aquatic Species and Habitat.

FIGURE 3.11-2
Water Resources Affected Environment
Midway Landfill Alternative
OMF South

- **Hylebos Creek.** The Hylebos Creek basin is made up of the West and East Forks of Hylebos Creek and their respective tributaries (Tributaries 0014C and 0016A), all of which join in confluence before discharging to Puget Sound's Commencement Bay via the Hylebos Waterway, approximately 6.9 miles downstream. Historically, the Hylebos Creek basin has seen extensive and rapid suburban development that has led to a loss of stream and wetland function and value. Development has altered the natural hydrologic balance, which has negatively impacted both hydrologic functions of flow control and water quality and resulted in increased flooding, erosion, and water quality impairments as well as loss of aquatic habitat and life (King County 1990).
    - East Fork Hylebos Tributary flows through the eastern portion of both the Preferred and South 344th Street alternatives just west of I-5 (Figure 3.11-1). There is currently no documented fish use in East Fork Hylebos Tributary within the study area (see Section 3.10.1.1). East Fork Hylebos Tributary does not have any listed 303(d) water quality impairments (Ecology 2012). Riparian vegetation along East Fork Hylebos Tributary in the study area may provide a range of benefits to water resource functions. Areas dominated by native forest and wetlands support functions such as fish and wildlife habitat (see Section 3.10.1.1); water temperature moderation; improved infiltration; groundwater recharge; sediment delivery, transport, and storage; nutrient and pathogen removal; and erosion control and stream channel stabilization.
    - West Fork Hylebos Tributary flows through the northwestern corner of the project limits of the Preferred Alternative, through a wetland (WFW-02) and an associated in-line stormwater detention facility with no defined channel. The wetland drains to the west through a long, piped segment that joins several other tributaries to form the West Fork of Hylebos Creek (Figure 3.11-1). There is presently no documented fish presence in West Fork Hylebos Tributary within the study area (see Section 3.10.1.1). Heavy urbanization and development in the upper watershed have likely contributed to elevated levels of pollutants associated with vehicle use, including metals such as copper, lead, and zinc, which are listed on the 303(d) water quality assessment impairments along with polycyclic aromatic hydrocarbons (Ecology 2018).
- **McSorley Creek.** There are no surface-flowing segments of McSorley Creek or its tributaries in the study area. The on-site stormwater facility at the Midway Landfill discharges to the North Fork of McSorley Creek, approximately 1 mile west of the study area (Figure 3.11-2). North Fork McSorley Creek would receive additional treated stormwater runoff from the Midway Landfill Alternative but would otherwise not be affected by project construction or operation. The North Fork originates in Des Moines and joins the South Fork in confluence in Saltwater State Park to form McSorley Creek before it discharges to Puget Sound. Fish have been documented in North Fork McSorley Creek (see Section 3.10.1.1). The 303(d) list identifies no water-body impairments for North Fork McSorley Creek, but approximately 1.2 miles downstream of the Midway Landfill, McSorley Creek has been listed for bacterial and dissolved oxygen impairments (Ecology 2012).

Table 3.11-1 Potentially Affected Surface Water Bodies

Surface Water Body	Stream Index Number[1]	Alternative	Water Quality Impairments[2]	Water Quality Impairments Category[2]	FEMA Floodplains[3]
Hylebos Creek Basin					
East Fork Hylebos Tributary	10.0016A	Preferred Alternative, South 344th Street	None	5	None
West Fork Hylebos Tributary	10.0014C	Preferred Alternative, South 344th Street	Copper, Lead, PAHs[4], Zinc	5	None
Lower Puget Sound Basin					
North Fork McSorley Creek[5]	09.0382	Midway Landfill	None	None	None
McSorley Creek[5]	09.0381	Midway Landfill	Bacterial, Dissolved Oxygen	5	None

Notes:

(1) Water Resource Inventory Area identification numbers according to King County (1990).

(2) According to the 303(d) Water Quality Impairment List (Ecology 2018).

(3) According to Federal Emergency Management Agency (FEMA) Flood Insurance Rate Maps (FIRMs) (53053C0968E, 53033C1250F) (FEMA 1995).

(4) PAHs: polycyclic aromatic hydrocarbons; specifically listed are Dibenzo(a,h)anthracene and Benzo(a)pyrene.

(5) No surface flowing portion of North Fork McSorley Creek is within the study area; however, because the Midway Landfill Alternative may potentially discharge stormwater to the stream, which discharges to McSorley Creek downstream, it has been included in this analysis.

Stormwater Runoff Characteristics Related to Hydrologic Soil Group

The study area contains Hydrologic Soil Groups A, B, and D, and Pits (Figures 3.11-3 and 3.11-4). Group A has low runoff potential and moderate- to high-infiltration potential and is generally compatible with a variety of LID approaches to stormwater facilities (USDA NRCS 2007, 2019a, 2019b). Group B has moderately low runoff potential and moderate infiltration capacity. Group D has high runoff potential and tends to restrict water movement and infiltration. Some portions of the study area have dual hydrologic classifications (B/D), where the first classification applies to the dry condition and the second to the wet condition. The Midway Landfill is classified as Pits, which is a pit-fill soil with properties modified by years of solid waste disposal and fill processes (USDA NRCS 2007) and not included in any hydrologic soil group.

Stormwater Runoff Characteristics Related to Land Use

Most of the basin areas occupied by the build alternatives are urbanized, with impervious surface cover currently ranging from approximately 50 to 80 percent. The Preferred and South 344th Street alternatives located in Federal Way are a mix of suburban/residential, commercial, industrial, and recreational land use. Other developed portions of the study area include major roadways (I-5, SR 99, SR 18, SR 161, and SR 167), as well as surrounding suburban developments.

The Midway Landfill Alternative is on a 68-acre site in Kent that was a gravel pit from 1945 to 1966 and a landfill for Seattle from 1966 to 1983. The site was listed as a Superfund site in May 1986, and cleanup was completed September 2000. The cleanup included covering the landfill with an engineered multilayer cap with a top layer of till grass, installing a gas extraction system to remove and control methane gas, and making improvements to the surface water drainage system, such as grading, alterations, and creation of a surface water holding pond (Ecology 2005).

FIGURE 3.11-4
Study Area Hydrologic Soil Groups
Midway Landfill Alternative
OMF South

Stormwater Management Systems

In the study area for all three alternatives, there are conveyance systems and management facilities that receive stormwater from the sites. The surface stormwater runoff is collected in piped municipal systems that consist of stormwater facilities, ditches, media filter drains, stormwater ponds, and vaults. The stormwater system also connects to piped stream reaches and historically modified wetlands that serve as in-line detention and flood control facilities (King County 1990). The modifications to the natural hydrologic system have historically disrupted natural flow patterns and processes, such as infiltration and groundwater recharge, and resulted in water quality degradation.

The Preferred and South 344th Street alternative sites currently discharge into regional stormwater facilities within Federal Way. Although the existing regional facilities will remain, the OMF South alternatives have been designed to have stormwater management facilities independent of the function of the existing regional facilities. The Preferred and South 344th Street alternative sites currently include some WSDOT managed stormwater facilities. The Midway Landfill has a regional stormwater facility that receives stormwater from off-site areas. The storm drain system downstream of that regional facility routes stormwater through Kent and ultimately discharges into McSorley Creek within Des Moines.

Shorelines, Floodplains, and Floodways

No regulated shorelines of the state have been identified within the study area (City of Kent 2009; City of Federal Way 2011, 2014). No regulated floodplains have been identified within the study area, either on adopted FEMA Flood Insurance Rate Maps or preliminary Flood Insurance Rate Maps (FEMA 1995).

Groundwater

The Preferred and South 344th Street alternatives are within Federal Way’s 100-year Wellhead Capture Zone, and both alternatives have a permanent impact footprint that grazes the fringe of the 10-year travel zone for the Wellhead Protection Area (Figure 3.11-1). Lakehaven Water and Sewer District manages the three main aquifer systems that underlie the city — the Redondo-Milton Channel Aquifer, the Intermediate Aquifer System (Mirror Lake and Eastland Upland Aquifers), and the Deep Aquifer — in cooperation with Federal Way. To protect the drinking water supply, they have implemented both the state of Washington’s Wellhead Protection Program and Section 1428 of the 1986 Amendments to the Federal Safe Drinking Water Act (City of Federal Way 2015). There are no sole-source aquifers designated by EPA in the study area of any of the alternatives (EPA 2019).

The Midway Landfill Alternative is not within any of the Wellhead Protection Areas (up to 10-year travel times) or Critical Aquifer Recharge Areas (categories 1 through 3) as identified by King County. As previously discussed, the Midway Landfill was listed as a Superfund site, with cleanup completed in 2000. The cleanup included covering the unlined landfill with an engineered multilayer cap and making improvements to the surface water drainage system (Ecology 2005). Rainwater is collected from the surface of the landfill and released into the North Fork of McSorley Creek. While some groundwater contamination at the site is above federal drinking water standards, there are no active sources of drinking water collection in the Midway Landfill Alternative study area. Kent’s drinking water supply is mainly provided by a well drilled into an underground aquifer. To meet additional system demands, Kent sources water from partnerships with Lakehaven Water and Sewer District, Covington Water District, and Tacoma Water to obtain surface water from the Green River Watershed (City of Kent 2018).

3.11.2 Environmental Impacts

3.11.2.1 No-Build Alternative

Under the No-Build Alternative, impacts to water resources from construction or operation of OMF South would not occur. However, other planned projects would have impacts in the OMF South study areas, but they would be required to manage stormwater effectively and minimize impacts to water resources. This includes TDLE, which overlaps with the OMF South Preferred and South 344th Street alternatives. If TDLE is constructed as proposed, the mainline track associated with these OMF alternatives would be built later in time. Impacts associated with construction of the mainline track are addressed within the build alternatives impacts discussion below. All other TDLE-related impacts are addressed in Chapter 4, Cumulative Effects Analysis.

3.11.2.2 Long-Term Impacts

Impacts Common to All Build Alternatives

Surface Water Resources

An increase in impervious surfaces (from new maintenance yards, associated mainline tracks, stormwater ponds, parking areas, building roofs, project road improvements, etc.) is associated with any area where vegetation or other pervious surface is converted to paved surface. These surfaces are associated with an increase in runoff volumes and decrease in groundwater recharge, which may increase flooding and flow frequencies. Also, the increased surface flow volumes and water quality impairments can contribute to stream erosion and aquatic habitat degradation, if not properly managed. Stormwater management facilities will be evaluated as part of the project design and are discussed in more detail in Section 3.11.2.4.

OMF South would add both pollution-generating impervious surfaces and non-pollution-generating impervious surfaces in the study areas for the proposed alternatives. Pollution-generating impervious surfaces are subject to vehicular use and include parking areas, bus holding areas, project-associated roads or road realignments, and yard and apron areas; these areas have the potential to accumulate contaminants that can be transported by stormwater runoff into receiving water bodies. Non-pollution-generating impervious surfaces are not subject to vehicular use and include the light rail tracks,[4] sidewalks, and rooftops, and stormwater ponds. Tables 3.11-2 and 3.11-3 summarize the range of impervious surface changes that would result from OMF South for the three build alternatives when compared with existing conditions. These alternatives would mainly redevelop existing parking lots and commercial business areas, in addition to some undeveloped areas along the I-5 corridor.

---

[4] Sound Transit and Ecology entered into a Memorandum of Understanding dated December 9, 2019, in which Sound Transit agreed to conduct a study to characterize the quality of the stormwater discharged from light rail mainline tracks. The data and analysis from the study will be used to inform the design of light rail projects that are scheduled in the Sound Transit 3 Plan to be completed between 2030 and 2041, and, as necessary, Sound Transit will identify all known, available, and reasonable methods of prevention, control, and treatment (abbreviated as AKART) to define light-rail specific BMPs. OMF South is scheduled to be completed by 2032.

Notes:

(1) For the water resource impact analysis, the landfill area was categorized as existing pervious grass in order to avoid underestimating potential impacts; however, this existing condition assumption should not necessarily be used for stormwater management design sizing.

(2) If neither the Preferred nor the South 344th Street alternative is selected, the mainline could be built later in time if TDLE is constructed as proposed. TDLE is currently under environmental review.

Midway Landfill	OMF Site	11	26	+15

Sources: Existing land cover analysis developed from project survey data and aerial imagery using GIS. Proposed land cover analysis developed from project design files using GIS.

Note:

(1) If neither the Preferred nor the South 344th Street alternative is selected, the mainline could be built later in time if TDLE is constructed as proposed. TDLE is currently under environmental review.

Shorelines, Floodplains, and Floodways

No regulated shorelines of the state exist within the study area; therefore, no impacts on shoreline resources would result from any of the proposed alternatives. All of the build alternatives are outside of mapped FEMA floodplains, and the preliminary design for the alternatives would span the mapped stream crossings without columns being placed within the boundaries. As a result, no impacts on mapped FEMA floodplains or floodways are expected.

Groundwater

The Preferred and Midway Landfill alternatives would not be located within groundwater protection boundaries and are not anticipated to adversely impact groundwater resources. The footprint of the South 344th Street Alternative may include the installation of columns to support the elevated guideway that could be placed on or near the edge of the 10-year wellhead protection area. Potential impacts would depend on design depth and column placement, but generally would be expected to be minimal.

Preferred Alternative

The Preferred Alternative, including both mainline track options, would convert approximately 20 fewer acres of land to impervious cover than the Midway Landfill Alternative and a similar amount to all mainline and tail track combinations of the South 344th Street Alternative. The Preferred Alternative, including both options, would result in the lowest net amount of pollution-generating impervious surfaces and would create the least new pollution-generating impervious surfaces compared to the South 344th Street and Midway Landfill alternatives.

For operational safety, trees and other tall vegetation would not be allowed to grow near the mainline, lead, tail, or test tracks. As a result, clearing of native forested vegetation close to proposed tracks in areas of the riparian zone associated with the East Fork Hylebos Tributary would be necessary. Under the Preferred Alternative, a loss of riparian vegetation may contribute to long-term impacts to water resources in the project area and downstream areas, including increased stream temperatures; decreased runoff interception and pollutant filtration functions; reduced groundwater recharge; increased erosion and sedimentation; and loss of stream channel stabilization. These impacts are discussed further in Section 3.10.2 and Appendix G3, Ecosystem Resources Technical Report. Shorter-stature trees and native vegetation may be replanted or replaced through natural establishment under elevated guideways to minimize riparian impacts.

The Preferred Alternative includes an extension of 18th Place S that would encroach upon a portion of a wetland (WFW-02) associated with West Fork Hylebos Tributary. The area of the wetland serves as an in-line stormwater detention facility through which the West Fork Hylebos Tributary currently flows. The construction of this road extension and bike/pedestrian pathway would place fill within the wetland boundary and construct retaining walls in the eastern portion of the wetland/detention facility. Potential impacts to the detention currently provided would be evaluated as the project design progresses and addressed in compliance with local and state requirements. Potential impacts to the wetland area and function are described in Section 3.10, Ecosystem Resources.

Frontage improvements along S 336th Street to meet city standards would necessitate the replacement of existing culverts that convey West Fork Hylebos Tributary under that roadway. If any culverts on potentially fish-bearing streams are replaced, the replacement structures would be designed and installed in accordance with WDFW’s Water Crossing Design Guidelines (Barnard et al. 2013). The current conceptual design indicates that the replacement structure for West Fork Hylebos Tributary would have a larger hydraulic opening than the existing culverts at that site (see Section 3.10.2.2). Replacing the existing culverts with a larger opening could support more natural sediment transport patterns in the stream and potentially improve water quality. In addition, crossings may require a flood risk assessment to document proposed project impacts to adjacent lands and floodplains changes.

For the Preferred Alternative, the project team has coordinated with Federal Way regarding the use of regional facilities. Although the existing regional facilities will remain, the Preferred Alternative has been designed to have stormwater management facilities independent of the function of the existing regional facilities to minimize impacts to the existing stormwater system capacity and stream functions. Federal Way requires redevelopment structures to return flow control regimes to fully forested predevelopment conditions. In addition, the proposed on-site facilities have been designed to separate stormwater from the flows of the West Fork Hylebos Tributary until they have received water quality treatment, to avoid impacts to downstream water quality.

The Preferred Alternative proposes to relocate and realign approximately 1,650 linear feet of East Fork Hylebos Tributary, which could potentially benefit stream habitat by adding channel sinuosity and habitat complexity. When existing structures and paved areas are redeveloped to current stormwater design standards, downstream receiving waters benefit because of improved flow control and water quality treatment. In addition, relocation and redesign of heavily modified conveyance systems that return them to more naturally connected states can result in beneficial impacts on water resources. A full discussion of habitat and stream buffer details is presented in Section 3.10, Ecosystem Resources.

South 344th Street Alternative

All of the combinations of mainline and tail track options associated with the South 344th Street Alternative would convert approximately 20 fewer acres of land cover to an impervious condition than the Midway Landfill Alternative and would convert similar amounts of land as compared to the Preferred Alternative. Both mainline track options for the South 344th Street Alternative would create the least amount of new pollution-generating impervious surfaces when paired with the Enchanted Parkway tail track alignment. Potential impacts on East Fork Hylebos Tributary and its riparian zone resulting from the clearing of vegetation would be similar in nature to those described for the Preferred Alternative, but they would extend over a greater distance. The South 344th Street Alternative would have similar long-term impacts to stormwater runoff as the Preferred Alternative because of similar increases in impervious surfaces.

The South 344th Street Alternative is located in a commercial and industrial area that is bordered by the I-5 corridor to the east. The South 344th Street Alternative also discharges to West Fork Hylebos Tributary. The design proposes to realign and meander East Fork Hylebos Tributary and daylight an approximately 420-foot-long section of currently piped stream. There is ongoing coordination with WSDOT to design the project to avoid or minimize impacts to the existing WSDOT stormwater facility near the southeast corner of the site. The remaining area would be used for the stream.

Emergency vehicle access to the mainline tracks would be needed in the daylighted stream location. One of the options under consideration may require approximately 60 feet of channel that is currently in culverts (and that would otherwise be daylighted, as described above) to be placed in a new culvert. Because this alternative would not include the extension of 21st Avenue S, the replacement crossing structure south of the daylighted channel would be shorter compared to the Preferred Alternative. It may be possible to eliminate the need for a culvert through detailed design of the access and of the stream meanders. The design of the emergency vehicle access would need to be coordinated and approved by Sound Transit, WSDOT, and Federal Way.

Similar to the Preferred Alternative, the proposed realignment and restoration of approximately 1,650 linear feet of East Fork Hylebos Tributary could potentially benefit habitat by adding channel complexity. When existing structures and paved areas are redeveloped to current design standards, it can result in a positive impact to downstream receiving waters because of improved flow control and water quality treatment. In addition, relocation and redesign of heavily modified conveyance systems that return them to more naturally connected states can result in beneficial impacts on water resources. A full discussion of habitat and stream buffer details is presented in Section 3.10, Ecosystem Resources.

The Enchanted Parkway tail track option for the South 344th Street Alternative may include elevated guideway columns that could touch the edge of the 10-year wellhead protection area. Potential impacts would depend on design depth and column placement, but generally would be expected to be minimal.

Midway Landfill Alternative

The Midway Landfill Alternative includes the site of a former landfill, which presents both short-term risks associated with construction and long-term risks and benefits associated with permanent structures and operational activities. Over time, landfill waste settles at different rates, creating an uneven surface that contributes to engineering challenges and long-term operational and maintenance concerns. Additionally, Midway Landfill is a Superfund site and is under active monitoring and reporting to ensure that the cleanup measures continue to function as planned, which includes an active methane gas extraction system.

The surface of the Midway Landfill is grass on dense, compacted soils that overlay an impermeable membrane cap, which prevents infiltration and directs runoff to an on-site surface water collection system. This landfill cover does not strictly meet the definition of either a pervious or impervious surface. For the purposes of the water resources impact analysis, the landfill area was categorized as existing pervious grass in order to avoid underestimating potential impacts. However, this existing condition assumption should not necessarily be used for later stormwater management design sizing.

Sound Transit has analyzed three potential subsurface construction design options for siting an OMF on the landfill, all of which would be compatible with the current FWLE design of at-grade mainline tracks. Common to the three subsurface construction design options would be the replacement of the landfill cap to prevent surface water and stormwater from entering any remaining portion of landfill and ongoing monitoring, testing, and management of landfill materials, as needed. These options are discussed in detail in Chapter 2, Alternatives Considered.

The Platform subsurface construction design option would build the OMF structure above the landfill. However, the elevated platform option could create pathways for groundwater contamination through the installation of concrete-filled drilled shafts.

The placement of the slab and beam system in the Hybrid subsurface construction design option would have the potential to partially impede access to the hazardous materials in the landfill and could create pathways for the contamination to enter the groundwater table through the installation of concrete-filled drilled shafts. The Platform and Hybrid subsurface construction design options for the Midway Landfill Alternative, which require concrete-filled drilled shafts or other structures to be installed, would need to be designed to prevent the downward migration of more contaminated groundwater or leachate to the aquifer below. Each of the three subsurface design options would result in refuse left on site, which would require the preservation, or reinstallation, of a permanent landfill cap system, a landfill gas monitoring system, and a groundwater monitoring system to ensure the ability to continue monitoring the site as required by the Consent Decree and Record of Decision.

The Full Excavation subsurface construction design option would have the greatest long-term benefit to water resources in the study area by potentially removing sources of contamination of surface and groundwater resources.

3.11.2.3 Construction Impacts

Impacts Common to All Build Alternatives

OMF South construction would primarily affect surface and groundwater quality by increasing the potential for flooding, erosion, or degrading water quality when runoff is generated in construction areas. In general, OMF South build alternatives would have similar potential construction-related impacts on water resources because of similarities in construction equipment and techniques. The activities that could affect water resources include:

- **Earthwork, trench work, stockpiling, and material transport.** Soil exposed in sloped excavations, fills, or trench work is especially susceptible to erosion until vegetation is established or the surface is stabilized with pavement. If exposed soil becomes dry, it can be eroded by wind. Loose soil can be carried off site by water or wind to stormwater drains or streams, where it increases water turbidity. Construction vehicle tires can carry soil onto roadways, where it can then be washed into ditches or streams during storms. Increased turbidity from sediment reduces light transmission as well as decreases dissolved oxygen in the water.
- **Concrete work and paving.** The pH in surface water can be increased to levels harmful to fish and wildlife if runoff mixes with process water or slurry from concrete work or curing concrete.
- **Stream relocations, culvert replacements, and crossings.** Over-water work, stream relocations, culvert replacements, stream crossings, and construction in stream buffers can pose a direct risk to water quality through pollutant spills, sediment transport, or wind deposition of stockpiled materials.
- **In-water work.** The risk of scour is usually increased during the construction phase of in-water work. This work, including activities that may disturb the stream bed or banks, has the potential to mobilize sediments at the project site and contribute to turbidity and sedimentation.
- **Construction machinery.** Equipment leaks or spills can affect water quality in nearby water resources. Hydrocarbons and other hazardous materials associated with construction machinery can create imbalances to parameters such as pH levels or dissolved oxygen in the water.

Preferred Alternative

West Fork Hylebos Tributary runs through the northwest corner of the Preferred Alternative, which has a wetland (WFW-02) and an associated in-line stormwater detention facility. Clearing and grading activities, including the placement of fill in the combined wetland/stormwater facility, could lead to short-term degradation of water quality through sedimentation and turbidity impacts. Construction-related impacts on East Fork Hylebos Tributary from the mainline track options would be higher for the 55 mph Design Option than for the 40 mph Alignment. During construction of frontage improvements along S 336th Street and installation of a replacement structure where the stream is crossed by the road, a segment of the stream would likely be placed in a temporary bypass while construction is underway. Discussion of the impacts analysis associated with the stream buffer and linear length in proximity to construction is presented in Section 3.10, Ecosystem Resources.

South 344th Street Alternative

The daylighting of East Fork Hylebos Tributary has the potential for direct risk to water quality through pollutant spills, sediment transport, or wind deposition of stockpiled materials due to the proximity of construction work to the stream channel. The risk of scour is usually increased during the construction phase of in-water work, which has the potential to mobilize sediments at the project site and contribute to turbidity and sedimentation.

The South 344th Street Alternative OMF site would have fewer temporary impacts to East Fork Hylebos Tributary than the Preferred Alternative. However, the South 344th Street Alternative mainline tracks (including all design options) would have more temporary impacts to East Fork Hylebos Tributary than the Preferred Alternative mainline tracks. Between the mainline track options for the South 344th Street Alternative, the 55 mph Design Option would have more temporary impacts to East Fork Hylebos Tributary than the 40 mph Alignment. The tail track options would have identical temporary stream impacts. Full impacts analysis associated with the stream buffer and linear length in proximity to construction is presented in Section 3.10, Ecosystem Resources.

Midway Landfill Alternative

Construction-related impacts on water resources are expected for each of the three Midway Landfill Alternative subsurface construction design options. Each has the potential to release contaminated air, soil, and groundwater through excavation or installation of concrete-filled shafts. Substantial remediation would be necessary, including cleanup and proper disposal of any excavated materials during construction to minimize contamination as well as groundwater monitoring in the surrounding area. Any transport of the hazardous materials being removed through excavation increases the risk of mobilizing them in the environment by exposure to wind, rain, and runoff, which could impact water resources at the site, along the transportation route, and those present at the final disposal destination.

The Platform subsurface construction design option involves drilling support shafts, which could affect water resources by compromising the landfill cap membrane and creating pathways for downward mobilization of contaminants into the groundwater and ultimately the aquifer recharge system in surrounding areas. The entire cap membrane system would be removed and replaced after the shafts have been installed to avoid this possibility. However, cap removal has the potential to prolong or increase exposure and mobilization risks associated with hazardous materials known to be present at the site.

The Hybrid subsurface construction design option involves some excavation with placement of a slab and beam system at grade for the tracks and drilling support shafts to support the buildings at the site. The partial excavation and drilling would involve the removal and replacement of the entire cap membrane system and has the potential to prolong or increase exposure and mobilization risks associated with hazardous materials known to be present at the site.

The Full Excavation subsurface construction design option would pose the greatest risk during construction for exposure and mobilization of hazardous materials present in the sediments being removed. This option has the most substantial excavation and, therefore, the greatest potential for a spill or mobilization of contaminated groundwater and sediments.

3.11.2.4 Avoidance and Minimization of Impacts

Sound Transit seeks to prevent or minimize potential impacts on water resources by implementing project design and development measures that follow local code requirements and stormwater management regulations, using required BMPs, encouraging sustainable LID approaches where feasible, and preparing for climate-related uncertainties where practicable. For example, seasonal limitations for in-water work will likely be required by resource agencies during permitting. In addition to traditional stormwater management facilities, BMPs also include project planning measures, design elements, implementation practices, inspections, and monitoring. This section discusses BMPs that would be included in the project design regardless of the findings of this water resources impact analysis. Therefore, they are not considered mitigation measures and are instead part of the proposed alternatives.

Sound Transit's Link Design Criteria Manual (Sound Transit 2020) requires project-related stormwater management to conform to the requirements of the local jurisdictions. These measures include minimizing impervious footprints, avoiding placement of design-related structural elements in or near water resources and their associated buffers when possible, and installing or upgrading water quality treatment and flow control facilities when required.

In addition, based on Sound Transit design standards (Sound Transit 2020) and Ecology requirements (Ecology 2019), stormwater management facilities would be designed using LID approaches where feasible (Puget Sound Partnership 2012). However, due to the presence of till-type soils with low infiltration and high runoff potential in the study area, the use of infiltration-based LID approaches may not be feasible, and other stormwater management approaches may be necessary.

Measures Common to All Build Alternatives

Flow Control

Flow control would be implemented by controlling runoff based on a target standard simulating forested land use conditions. Proposed BMPs were developed using a conservative approach to drainage concepts, consulting the Western Washington Hydrology model developed by Ecology to estimate hydrology and facility sizing. Currently, the use of underground detention vaults is assumed for all alternatives. However, as design progresses, flow control may be provided by stormwater ponds or combinations that include other facility types, where feasible.

Water Quality Treatment

The project would provide water quality management based on enhanced treatment standards (intended to provide a higher rate of removal of dissolved metals than basic treatment) for all post-project pollution-generating impervious surfaces. This level of treatment uses Ecology-approved BMPs meeting standards for all known, available, and reasonable methods of prevention, control, and treatment (abbreviated as AKART). These BMPs are expected to treat water quality to the standards protective of designated uses of groundwater and surface waters under WAC 173-200 and WAC 173-201A, respectively. However, while impacts to designated uses of natural waters are not expected, it is possible that some sensitive aquatic species could be harmed due to the limitations of available treatment technology. Even with AKART, some pollutants may not be completely removed from runoff, and discharges from sites with approved BMPs may still release low concentrations of pollutants that could harm some sensitive aquatic species. See Section 3.10.2.2 for additional discussion of sensitive species.

Use of Existing Facilities

Stormwater could be routed to existing regional or on-site facilities or could be managed through new facilities. Using existing facilities would reduce the stormwater facility footprint, and this approach will be evaluated as part of the ongoing design process. However, the conceptual engineering design is based on providing project-specific stormwater BMPs rather than using existing regional or on-site BMPs.

Construction

The risk of construction-related impacts on water resources would be controlled by complying with the NPDES Construction Stormwater General Permit process and the WDFW Hydraulic Project Approval (as required) and by following guidance from the Sound Transit Design Criteria Manual, the WSDOT Highway Runoff Manual, the King County Stormwater Pollution Prevention Manual, the Pierce County Stormwater Management and Site Development Manual, and Ecology Manual standards and BMPs, as appropriate. Through compliance with these requirements, an approved Construction Stormwater Pollution Prevention Plan (CSWPPP) would be developed and implemented for the proposed Project. The CSWPPP would serve as the overall construction stormwater mitigation plan by describing overall procedural and structural pollution-prevention and flow control BMPs, including location, size, maintenance requirements, and monitoring. An Ecology-certified erosion and sediment control lead (CESCL) would be employed to conduct the inspections, and deficiencies would be promptly corrected. In addition, the CSWPPP would include, at a minimum, the following plans:

- Temporary Erosion and Sediment Control Plan – This plan would outline the design and construction specifications for BMPs to be used to identify, reduce, eliminate, or prevent sediment and erosion problems.
- Spill Prevention, Control, and Countermeasures Plan – This plan would outline requirements for and implementation of spill prevention, inspection protocols, equipment, material containment measures, and spill response procedures.
- Concrete Containment and Disposal Plan – This plan would outline the management, containment, and disposal of concrete debris, slurry, and dust and discuss BMPs that would be used to reduce high pH.
- Dewatering Plan – This plan would outline procedures for pumping groundwater away from the construction area, and storing (as necessary), testing, treating (as necessary), and discharging or disposing of the dewatering water.
- Fugitive Dust Plan – This plan would outline measures to prevent the generation of fugitive dust from exposed soil, construction traffic, and material stockpiles.

Specific BMPs would be incorporated into construction plans and specifications based on the manuals previously mentioned. BMPs could include, but are not limited to, the following:

- Developing construction plans for sensitive areas such as streams and their buffers
- Phasing the work to minimize the amount of disturbed area at any one time
- Stabilizing construction entrances, haul roads, and other surfaces that could produce erosion or sediment tracking
- Providing tire wash, silt fence, stockpile covers, and other protection measures to avoid sediment transport

- Cleaning construction site track-out from public roads, as necessary
- Constructing silt fences downslope from exposed soil
- Protecting catch basins from sediment
- Containing and controlling concrete, fuel, and hazardous materials on site
- Installing temporary ditches, asphalt berms to route runoff around or through construction sites, with periodic check dams to slow and settle runoff
- Providing erosion control covering and temporary piped conveyances to protect slopes from concentrated runoff
- Providing temporary plastic or mulch to cover soil stockpiles and exposed soil
- Using temporary erosion control blankets or mulch on exposed steep slopes to minimize erosion before vegetation is established
- Constructing temporary sedimentation ponds or cells to remove solids from concentrated runoff and dewatering before being discharged
- Conducting vehicle fueling and maintenance activities no closer than 100 feet from waters of the state
- Providing secondary containment for all potential sources of leaks and spills
- Implementing stream protection measures, including diverting stream flow around the construction area, and limiting the construction period to the required “work window,” a period of the year when fish would be minimally affected

Preferred Alternative

As previously stated, the extension of 18th Place S would encroach upon a portion of a wetland (WFW-02) associated with West Fork Hylebos Tributary that serves as an in-line stormwater detention facility. Potential impacts to the detention currently provided will be evaluated as the project design progresses and mitigation will be developed in compliance with local and state requirements.

Measures for mitigating impacts to water quality resulting from stream channel relocation for the Preferred Alternative could include those outlined by the WDFW in Chapter 13 of the Water Crossing Design Guidelines (Barnard et al. 2013). This could involve preventive BMPs, such as erosion and sediment control measures, the use of cofferdams, complete stream bypass, and restorative planting efforts. The construction of the Preferred Alternative would have the potential to impact water quality parameters such as turbidity; however, through compliance with applicable construction permits and the BMPs incorporated by the permits, the risks to water resources would be minimized.

South 344th Street Alternative

Similar to the Preferred Alternative, compliance with applicable construction permits and BMPs would minimize risks to water quality during construction. Measures for mitigating impacts to water quality resulting from stream channel relocation for the South 344th Street Alternative would be similar to those discussed above for the Preferred Alternative. In addition, the South 344th Street Alternative would include the daylighting of a piped segment of East Fork Hylebos Tributary.

Midway Landfill Alternative

For the Midway Landfill Alternative, Sound Transit would implement BMPs that include material handling and disposal plans for contaminated media and hazardous construction debris developed in conjunction with the appropriate regulatory agencies, including BMPs to prevent the potential downward migration of contaminants during construction of drilled shafts. All of the subsurface construction design options for the Midway Landfill Alternative would require placement of a low-infiltration cap to protect water resources in accordance with the current Superfund remedy, which could exclude the potential for infiltration-based LID approaches and make other stormwater management approaches necessary.

Special precautions at Midway Landfill would be required by the CSWPPP for temporary drainage systems and surface treatment after removal and during replacement or remediation of the existing membrane cover system.

A discussion of the impacts related to construction at a site with known hazardous substances is presented in Section 3.13, Hazardous Materials. Any of the subsurface construction design options for the Midway Landfill would require Ecology and/or EPA approval to amend the existing Cleanup Action Plan and Record of Decision to confirm that the project would maintain the commitments currently in place for the landfill, including protection of water resources.

3.11.2.5 Indirect Impacts

No indirect impacts related to water resources would result from construction and operation of the proposed project.

3.11.3 Mitigation Measures

The project would apply required stormwater BMPs, such as the flow control or treatment facilities described in Section 3.11.2.4, Avoidance and Minimization of Impacts. As previously discussed, these BMPs are expected to treat water quality to the standards protective of designated uses of groundwater and surface waters under WAC 173-200 and WAC 173-201A, respectively, and the need for additional mitigation to protect these designated uses is not anticipated. However, while impacts to designated uses of natural waters are not expected, it is possible that some sensitive aquatic species could be harmed due to the limitations of available treatment technology. Even with AKART, some pollutants may not be completely removed from runoff, and discharges from sites with approved BMPs may still release low concentrations of pollutants that could harm some sensitive aquatic species. Mitigation with regard to sensitive species and mitigation for ecosystem impacts related to wetlands, streams, and their buffers is addressed in Section 3.10, Ecosystem Resources.

3.12 Geology and Soils

This section addresses topography, geology, soil characteristics, geological hazards, and groundwater and potential impacts to these resources from the OMF South project alternatives. These considerations affect project design construction methods. The OMF South build alternatives are in Federal Way and Kent, both of which have adopted critical area ordinances for geologically sensitive areas, which are defined as areas that are not readily suited for development because of their susceptibility to erosion, sliding, earthquake-induced damage, or other geologic events. The study area includes resources within 100 feet of the potential construction limits of the alternatives.

3.12.1 Affected Environment

3.12.1.1 Topography

Elevations in the study areas are similar, ranging from 400 to 450 feet above sea level. Topographical features in the study area include various drainage systems, small water bodies, natural slopes, constructed slopes for bridges and other road-related elements, and associated topographic features indicative of Pleistocene continental glaciation.

3.12.1.2 Geology

The study areas are primarily underlain by Vashon till, a glacial till consisting of a generally unsorted mixture of clay, silt, sand, cobbles, and boulders deposited by continental Pleistocene glaciation. The regional geology includes glacially consolidated soils and sediments to a depth of almost 1,600 feet near the South 344th Street Alternative to over 1,200 feet near the Midway Landfill Alternative (Jones 1996). The areas beneath the highway on/off-ramps and overpasses directly adjacent to the Preferred and South 344th Street alternatives consist of Holocene artificial fill. Before it was used as a landfill, the Midway Landfill Alternative site was a gravel pit. Excavation exposed Pleistocene sand and gravels of glacial origin below the Vashon till.

3.12.1.3 Soils

Soils within the study area for all build alternatives primarily consist of gravelly sandy loams and sandy loams that have developed on the Pleistocene continental glacial drift of the Vashon till described above. Generally, these soils are moderately to excessively well drained. Many of the original soils within the project area have been removed or modified by land development.

3.12.1.4 Soil, Aggregate, and Rock Resources

There are no existing economic soil, aggregate, or rock resources within the study area. As noted, the Midway Landfill Alternative site was a gravel pit before 1966 when it was converted to a landfill.

3.12.1.5 Geotechnical Characteristics and Hydrogeology

Preferred and South 344th Street Alternatives

Understanding of the subsurface in the vicinity of the Preferred and South 344th Street alternatives is based on work completed for the S 336th Street/I-5 overcrossing and the I-5/SR 18 interchange (Shannon & Wilson 2020). The soil beneath the build alternative sites, including the mainline and tail tracks, are thought to include a 5- to 15-foot-thick layer of surficial fill soil that is associated with past site development. The composition and compactness of the fill is unknown and likely to be highly variable. Beneath the fill, native soils consist of dense to very dense glacial sand and gravel outwash and glacial till. The groundwater table is anticipated to be shallow at the site, ranging from 15 to 25 feet below the existing ground surface.

Midway Landfill Alternative

The Midway Landfill Alternative site contains municipal solid waste underlain by native glacially derived sand, gravel, and glacial till. The municipal solid waste is estimated to be deepest in the southeast portion of the landfill, where waste fill thickness could be up to 130 feet or more. It is believed that the municipal solid waste fill thickness decreases to the north and west, where it is thought to typically be about 50 to 60 feet thick (City of Kent 2019).

The municipal solid waste fill is underlain by advance outwash soils and till deposits. The advance outwash soils generally consist of sand and gravel that were deposited by streams or rivers in front of the advancing continental glaciers. The till deposits are generally classified as compact silts and sands that have been glacially overridden. Shallow groundwater adjacent to the landfill occurs as discontinuous lenses at a depth of approximately 30 feet below ground surface. Leachate within the solid waste fill has been noted at depths of 30 to 40 feet below ground surface. See Appendix D4, Midway Landfill Human Health Risk Assessment, for further information regarding geotechnical characteristics at the Midway Landfill.

3.12.1.6 Geologic Hazards and Resources

Seismicity and Earthquakes

Earthquake hazards in the study area are primarily related to the convergent plate boundary of the North American continental plate and the Juan de Fuca oceanic crustal plate, known as the Cascadia Subduction Zone. This subduction zone boundary has a long history of large earthquakes (Frankel and Peterson 2008).

Additionally, intracrustal faults, such as the Tacoma and Seattle faults, can rupture, which can also cause substantial ground displacement and shaking. The Tacoma Fault Zone runs east-west through the Preferred and South 344th Street alternatives study area and has the potential to produce a major seismic event and ground rupture (Gomberg et al. 2010). The Tacoma Fault Zone lies approximately 3 miles south of the Midway Landfill Alternative. The Seattle Fault lies approximately 9 miles north of the Midway Landfill Alternative, and it is unlikely it would cause ground displacement in the study area.

Volcanic Hazards

Mount Rainier, an active stratovolcano located approximately 40 miles to the southeast, has produced substantial lahars (a mud or debris flow composed of water, debris, and pyroclastic material) in the Puyallup River Valley that have reached Puget Sound. The most recent lahar to reach Puget Sound occurred approximately 5,600 years ago. Based on the historical extent of lahar deposits (WDNR 2020), the three OMF South alternatives are unlikely to be affected by a lahar originating from Mount Rainier.

Landslides, Steep Slopes, and Erosion Hazards

Landslide hazard areas are generally defined as areas prone to earth movements through a combination of site factors, including slope, local geologic and soil conditions, precipitation and groundwater flow, freeze/thaw cycles, seismic events, and human impacts. Historical landslides and erosion hazards (a consideration of slope and soil types and characteristics) have not been identified in the study area. The Preferred Alternative has an area of steep slope (defined as over 40 percent) on the west side of the site.

Soil Properties

Particular soil properties can be challenging for development and infrastructure projects. Soils with particular textures, pH, and salt contents can be corrosive to both concrete and uncoated steel. Within the project area, multiple soil types in the study areas are considered corrosive to steel (USDA NRCS 2020).

Hydric soils are generally described as having been formed in saturated environments and having a water table close to ground surface. These soils create surface conditions susceptible to standing water and are generally limiting for construction purposes. The only hydric soil mapped within the study areas of any of the alternatives is a discrete area (approximately 2.6 acres) of Tukwila Muck in the northwest corner of the Preferred Alternative. This soil unit is also described as Wetland WFW-02 in Section 3.10, Ecosystem Resources.

Groundwater, Sole Source Aquifer Resources

The Preferred and South 344th Street alternatives are within Federal Way's 100-year Wellhead Capture Zone, and both alternatives have a permanent impact footprint that touches the outer edge of the 10-year travel zone for the Wellhead Protection Area. The Midway Landfill Alternative is not located within any of the Wellhead Protection Areas or Critical Aquifer Recharge Areas (categories 1 through 3). There are no sole source aquifers designated by EPA in the study area of any of the build alternatives. Groundwater resources are discussed in further detail in Section 3.11, Water Resources.

3.12.2 Environmental Impacts

A summary of long-term, construction, and indirect impacts to geologic and hydrogeologic conditions is presented below.

3.12.2.1 No-Build Alternative

Under the No-Build Alternative, impacts to geology and soils from construction or operation of OMF South would not occur. However, other planned projects would have impacts in the OMF South study areas. FWLE conducted some grading and filling in the Midway Landfill Alternative study area, adjacent to I-5, but these impacts to geology and soils were relatively minor. Other projects planned to be constructed within the alternative study areas may impact geology depending on the extent of grading and filling activities. This includes TDLE, which overlaps with the OMF South Preferred and South 344th Street alternatives. However, these impacts are also anticipated to be minor. If TDLE is constructed as proposed, the mainline track associated with these OMF alternatives would be built later in time. Impacts associated with construction of the mainline track are addressed within the build alternatives impacts discussion below. All other TDLE-related impacts are addressed in Chapter 4, Cumulative Effects Analysis.

3.12.2.2 Long-Term Impacts

Impacts Common to All Build Alternatives

The build alternative sites are located on highly urbanized land, and long-term effects on existing geologic and hydrogeologic conditions are likely to be limited. Long-term effects related to the completion and operation of OMF South that could occur are discussed below. All three build alternatives are in areas of relatively flat topography, with the exception of the steep slope on the Preferred Alternative site, and existing slope stability and landslide issues would be of minor concern during the period of operation at each of the sites.

Project structures, including elevated mainline, lead, test, and tail tracks, would be designed to withstand a major seismic event, as all build alternatives are within a seismically active area. Strong shaking has the potential to cause settlement, slope instability, and increased lateral pressure on retaining walls. Facilities would be designed in accordance with the International Building Code, which would result in an increased resistance to seismic shaking and reduce risk to the project. Each build alternative is in areas of low seismic liquefaction potential. Areas of introduced fill would be more highly susceptible to liquefaction, which would be assessed during final design.

Long-term changes in groundwater flow after construction are not expected.

Preferred Alternative

There are no additional impacts specific to the Preferred Alternative beyond those discussed above, under Impacts Common to All Build Alternatives. The steep slope on the Preferred Alternative site would likely be regraded with construction of the 18th Place S extension.

South 344th Street Alternative

The only additional impact from the South 344th Street Alternative, beyond those discussed above, is the potential for the installation of columns associated with the Enchanted Parkway tail track option, which has the potential to impact groundwater within the Federal Way 10-year wellhead protection area depending on the design depth.

Midway Landfill Alternative

Naturally corrosive soils as well as potentially corrosive leachate or groundwater within or in the vicinity of the Midway Landfill may compromise steel or concrete structures. Based on specific site conditions, structures can be designed with materials that resist the corrosivity of site-specific soil, groundwater, or leachate characteristics. The Platform and Hybrid subsurface construction design options for the Midway Landfill Alternative, which require support structures to be installed, would need to be designed to prevent the downward migration of more contaminated groundwater or leachate to the aquifer below.

While the Full Excavation subsurface construction design option removes all refuse from the landfill and replaces it with competent fill, the Platform and Hybrid subsurface construction design options would require alteration and replacement of the landfill gas mitigation system required by the EPA Record of Decision. Additionally, each subsurface construction design option would require the removal and replacement of at least a portion of the cap required by the Record of Decision. The Platform and Hybrid subsurface construction design options would leave refuse in place, which could lead to settlement issues within the project area.

3.12.2.3 Construction Impacts

Impacts Common to All Build Alternatives

The extent of earthwork needed for the build alternatives is dependent on site-specific topography, planned future site grades, and the usability of existing site soils for reuse. The nature and composition of excavated site soils would be evaluated for reuse as structural fill for construction purposes. Some soils that are not suitable for reuse as structural fill may be used for other on-site purposes if the need exists. While all build alternatives are in areas of relatively flat topography, all sites would need to be regraded, which would result in the need for retaining walls in certain locations.

Table 3.12-1 shows relative approximate cut and fill volumes for the alternatives and assumes that all unusable cut materials would need to be exported. The cut volume for the Midway Landfill Alternative includes soils and landfill materials. Imported fill would be soil. For the Platform and Hybrid subsurface construction design options at the Midway Landfill Alternative, there would also be imported concrete (approximately 531,000 and 165,000 cubic yards respectively).

Table 3.12-1 Cut and Fill Volumes for the OMF South Build Alternatives

Alternative	Cut Volume (cubic yards)	Cut Volume Reuse[1] (cubic yards)	Imported Soil Fill (cubic yards)	Material Removed from Site (cubic yards)
Preferred[2]	425,000	220,000	185,000	205,000
South 344th Street[2]	580,000	270,000	200,000	310,000
Midway Landfill –Platform	1,010,000	340,000	0	670,000
Midway Landfill – Hybrid	4,270,000	1,710,000	1,240,000	2,560,000
Midway Landfill – Full Excavation	4,870,000	1,950,000	1,610,000	2,920,000

Notes:

(1) Reusable quantities of cut volume are assumed to be 40 percent for Midway Landfill alternatives and 80 percent for the Preferred and South 344th Street alternatives.

(2) Volume estimates do not include quantities for the mainline or tail track construction. The quantities would be relatively small and would be associated with building the foundations for the elevated portions of track and the short length of mainline tracks that would be built on retained fill.

With a shallow groundwater table expected in the vicinity of the Preferred and South 344th Street alternatives, there may be a need for dewatering or managing groundwater in deeper excavations, depending on design requirements. There may also be a need for BMPs limiting the downward migration of potential contaminants during the installation of columns for the South 344th Street Alternative tail tracks as the southern end intersects with the 10-year wellhead protection area for municipal water supply wells in Federal Way. If either the Full Excavation or Hybrid subsurface construction design option is chosen for the Midway Landfill Alternative, leachate and/or local groundwater would need to be managed during the excavation process.

If dewatering is required, the water would likely need to be treated on site or disposed of at an approved facility. For the Midway Landfill Alternative, removal of leachate or locally impacted groundwater from the vicinity of the project area would improve overall groundwater quality in the region. Any dewatering during excavation may impact groundwater flow direction in the vicinity of the study area for all build alternatives. In the case of the Midway Landfill Alternative, pumping water and/or leachate from the landfill itself would draw surrounding groundwater (and associated contaminants) toward the landfill, which would not be likely to negatively affect groundwater quality in the vicinity of the landfill.

Aside from the potential need to address groundwater and leachate during excavation and to import fill for the Midway Landfill Alternative Full Excavation and Hybrid subsurface construction design options, there would be no appreciable differences in construction impacts to geology and soils between the build alternatives.

3.12.2.4 Avoidance and Minimization of Impacts

Construction specifications would include the following BMPs to address the potential short-term erosion of soils within the construction area:

- Minimizing areas cleared of vegetation
- Providing temporary cover or mulch for exposed soil stockpiles
- Using erosion control blankets on exposed slopes

The fugitive dust control plan described above in Section 3.8, Air Quality and Greenhouse Gas Emissions, would also address these concerns.

Short-term impacts to shallow groundwater quality from construction activities would be minimized by identifying the following BMPs in construction specifications:

- Containing and controlling waste and hazardous materials on site
- Confining maintenance and refueling activities to areas where excavations would not be impacted
- Preventing downward migration of contaminants in groundwater during shaft drilling using seals and reduced casing size at the Midway Landfill

In addition to the geotechnical borings that were installed during the preliminary engineering phase, Sound Transit would conduct additional geotechnical studies during final design. These studies would include borings and other exploration methods, laboratory testing of soil, and detailed foundation design for the project. This work would inform and refine the project design, construction techniques, and potential mitigation measures. The project design would meet state and federal design and construction codes for transportation projects.

Depending on final design, dewatering and groundwater management may be needed due to areas of shallow groundwater in the vicinity of the Preferred and South 344th Street alternatives. For all build alternatives, methods could include localized dewatering and groundwater injection, using sheet-pile walls, or freeze-shoring for horizontal groundwater containment.

If dewatering is required for construction of the Midway Landfill Alternative, contaminated groundwater concerns would be considered during design in compliance with future amendments to the Ecology Cleanup Action Plan or EPA Record of Decision. The current Cleanup Action Plan and Record of Decision requirements include continued operations and maintenance of site remedial actions, including the low permeability cap, the landfill gas extraction and monitoring system, and the surface water management system. Institutional controls implemented as part of the Record of Decision require the city of Seattle to continue operating and maintaining these remedial actions and provide an annual review of groundwater quality downgradient of the landfill.

Additionally, excavation of the Midway Landfill is expected to be restricted so as not to allow work during the wet season, which in western Washington is considered to be October 1 through April 30. This would reduce the amount of precipitation that could come in contact with the exposed refuse, which then could become contaminated water that could contribute to the contaminated groundwater at the site. Any of the subsurface construction design options for the Midway Landfill would require Ecology and/or EPA approval to amend the Cleanup Action Plan and Record of Decision to confirm that the project would maintain the commitments currently in place for the landfill, including protection of groundwater.

3.12.2.5 Indirect Impacts

No indirect impacts related to geology and soils would result from construction and operation of the proposed project.

3.12.3 Mitigation Measures

With appropriate use of engineering design standards and BMPs, geological and soils impacts are not expected, and additional mitigation is not anticipated.

3.13 Hazardous Materials

This section summarizes the hazardous materials analysis, which identifies properties near the OMF South project alternatives recognized to have hazardous materials issues associated with current or historical site activities or that have a documented release to the environment. A hazardous material is any substance that — because of its quantity, concentration, or physical or chemical properties — may pose a hazard to human health and the environment, either by itself or through interaction with other factors. Types and locations of sites were identified to evaluate potential impacts to construction, property ownership, and general public health and safety.

The study area for the hazardous materials analysis includes the area within a 1/8-mile radius of the construction limits for each build alternative. Properties farther than 1/8 mile were not considered for further analysis because they present a low probability of having hazardous materials releases that could affect the study area. Within the study area, the hazardous materials analysis included review of data from the Environmental Data Resources Inc. (EDR) database, review of historical land use, and a visual windshield survey to confirm the results of the database review. The EDR reports summarize federal, state, and local database information, and this information — along with the Ecology Cleanup Site Search database — was used to evaluate the three build alternatives, with an emphasis on known sites on, adjacent to, or near each alternative.

3.13.1 Affected Environment

The affected environment in the project study area was assessed by reviewing the state and federal regulatory database records as described above. The identified sites were ranked based on the proximity to the study area, the type and number of databases in which the site was found, known releases of hazardous materials or petroleum products, and the status of remediation or cleanup efforts at sites with known releases. One of three risk categories was assigned to sites within the study area: high, medium, and low.

- **High Risk.** Sites that involve substantial contamination of large areas, including soil, groundwater, and multiple contaminants, and might represent higher risk of further releases of hazardous materials to human health or the environment; that would be likely to involve high levels of regulatory approvals or extensive or lengthy remediation activities that may create other impacts to the environment; or that could pose major delays to the development of the project.
- **Medium Risk.** Sites where the nature of potential contamination is known based on existing investigation data, the potential contaminants are not extremely toxic or difficult to treat, and probable remediation approaches are straightforward.
- **Low Risk.** Sites where the nature of potential contamination is known based on existing investigation data and the sites are not expected to have notable impacts on the project due to their location, or sites where hazardous materials were used but had no or only very small, reported releases.

Table 3.13-1 lists the risk categories assigned to properties found during the regulatory records search within the 1/8-mile study area for each build alternative. These sites are also shown in Figures 3.13-1 and 3.13-2.

Table 3.13-1 Number of Hazardous Material Sites within Study Areas

Alternative	High Risk	Medium Risk	Low Risk	Total
Preferred	0	5	53	58
South 344th Street	0	5	59	64
Midway Landfill	1	4	43	48

3.13.1.1 Preferred Alternative

Regulatory Database Review

There were no high-risk hazardous materials sites identified for the Preferred Alternative. Five medium-risk hazardous materials sites were identified in the Preferred Alternative study area. Two of these sites are not properties that would be acquired, so are not discussed further:

- Belmor Mobile Home Park (2101 S 324th Street) is located at the northern portion of the mainline tracks. Gasoline-contaminated soil associated with a leaking underground storage tank was remediated, and the site was issued a No Further Action determination by Ecology.
- The Bryan Property (1908 S 341st Place), also listed as Abra Auto Body & Glass Federal Way, has been operating as an automotive repair shop since at least 2001. After numerous violations during environmental inspections, surface water, soil, and sediment samples were taken, and elevated levels of petroleum hydrocarbons and metals were found. The site entered the Ecology Voluntary Cleanup Program in 2013. Ecology has stated that there is no soil-to-groundwater pathway. Remedial activities on the property have been ongoing and a request for a No Further Action Determination was made by the property owner in 2019. Ecology issued a No Further Action letter in April 2021.
- The Lloyd Enterprises, Inc. site (2102 S 341st Place) was a former composting facility with several underground storage tanks on site and is a full acquisition for this alternative. All underground storage tanks have been removed, and the facility has been closed. No indication of release from the underground storage tanks was found. A small lube/motor oil spill (approximately 10 gallons) was reported in 2016; however, this incident has been closed and did not require listing in a large cleanup database.

Hazardous Material Sites
Midway Landfill Alternative

Historical Aerial Review

Historical aerial photographs of the Preferred Alternative area were obtained from EDR and compiled in the EDR Aerial Photo Decade Package. Aerial photographs were examined for the years 1941, 1943, 1957, 1968, 1972, 1980, 1990, 2006, 2009, 2013, and 2017. Observations are listed below.

- 1941–1943: The area appears to be mostly undeveloped, wooded land surrounded in all directions by undeveloped, partially wooded land. North Lake is visible to the far northeast of the site. Some rural residential properties are visible in the area. SR 99 is developed to the west, S 344th Street is developed to the south, and S 336th Street is developed to the north.
- 1957: A small residence or commercial building is located immediately to the southwest of the site. SR 18 is visible to the south of the site.
- 1968–1972: Some commercial and industrial development is visible to the north and west of the site. I-5 is visible to the east of the site. Development immediately to the southwest is visible. Residential and commercial development is visible in all directions from the site. Botanical gardens are visible to the far east of the site.
- 1980–1990: The site remains undeveloped, wooded land. Commercial development is visible immediately to the north, west, and south of the site.
- 2006–2017: The Christian Faith Center and associated parking lots are developed on the site. The surrounding area appears to be developed similarly to current conditions, with commercial, industrial, and residential development to the east, south, west, and north of the site.

3.13.1.2 South 344th Street Alternative

Regulatory Database Review

There were no high-risk hazardous materials sites identified for the South 344th Street Alternative.

The study area for the South 344th Street Alternative has the same five medium-risk hazardous materials sites as the Preferred Alternative, plus one additional site:

- 1910 S 344th Street has one operational underground storage tank and some violations of compliance. A surface petroleum spill is listed in 2003, though it is not related to the underground storage tank. Formal administrative compliance violations have been listed for the property.

Historical Aerial Review

Historical aerial photographs of the South 344th Street Alternative area were obtained from EDR and compiled in the EDR Aerial Photo Decade Package. Aerial photographs were examined for the years 1941, 1943, 1957, 1968, 1972, 1980, 1990, 2006, 2009, 2013, and 2017. Observations are listed below.

- 1941–1957: The site appears to be rural residential property on the southern portion and undeveloped, wooded land on the northern portion, surrounded in all directions by undeveloped, partially wooded land. North Lake is visible to the far northeast of the site. Some rural residential properties are visible in the area. SR 99 is developed to the west, S 344th Street is developed to the south, and S 336th Street is developed to the north.

- 1968–1972: Additional residential development is visible on the site. Some commercial and industrial development is visible to the north and west of the site. I-5 is visible to the east of the site. Development immediately to the northwest is visible. Residential and commercial development is visible in all directions from the site. Botanical gardens are visible to the far east of the site.
- 1980: The eastern portion of the site appears to be cleared and primed for development. Commercial development is visible immediately to the west and northwest of the site. The surrounding area to the far north, west, and south is developed with commercial, industrial, and residential properties.
- 1990: Commercial development is visible on the site, with several buildings and associated parking lots as well as land cleared for development.
- 2006–2017: The site appears to be developed similarly to current conditions, with multiple commercial buildings and parking lots, including a sports center, an RV storage center, and a church. The adjacent property to the north is developed with the Christian Faith Center and associated parking lot. The surrounding area appears to be developed similar to current conditions, as well, with commercial, industrial, and residential development to the east, south, west, and north of the site.

3.13.1.3 Midway Landfill Alternative

Background

The Midway Landfill is a Superfund site owned by the city of Seattle and managed by SPU. It is regulated by the Ecology and EPA under an existing Ecology Consent Decree and Cleanup Action Plan and EPA Record of Decision. The Midway Landfill was originally a gravel pit, which operated from 1945 to 1966. SPU began landfill operations at the site in 1966, accepting primarily demolition-type wastes. The landfill closed in 1983. Approximately 3,000,000 cubic yards of solid waste, reported to include demolition materials and wood waste as well as two million gallons of industrial liquids, were deposited at the unlined landfill facility (EPA 2015). Refuse depths in some areas are up to 130 feet.

When the landfill closed, concerns were raised regarding negative impacts to human health and the environment. Testing indicated landfill gas outside the landfill's boundary, and organic and inorganic contaminants were found in groundwater. An active landfill gas management system was installed in 1985, and in 1986 the Midway Landfill was placed on the National Priorities List due to groundwater contamination. With the listing, EPA assumed responsibility for facility oversight. Pursuant to Washington State's Model Toxics Control Act, SPU entered into a Consent Decree with Ecology in 1990 to initiate cleanup work.

The basis of action is groundwater contamination above federal drinking water standards. Original contaminants of concern include 1,2-dichloroethane, vinyl chloride, and manganese. During the 2010 to 2020 Five-Year Review periods, 1,4-dioxane was detected above Model Toxics Control Act Method B levels and is also considered a potential contaminate of concern. A final remedy for the site was identified in a Record of Decision by EPA, with Ecology's concurrence, on September 6, 2000. The identified remedy's aim was to ensure refuse containment is effective and maintained, groundwater quality is restored beyond the landfill boundary, and that no residential exposure to groundwater occurs until standards have been met.

The site is covered with a landfill cap. The cap layers from bottom to top, are a 12-inch-thick layer of low permeability (1×10^{-7} cm/sec) soil/clay material; a 50-millimeter-thick, high-density polyethylene geomembrane; drainage geonet; geotextile; a 12-inch-thick drainage layer; and a minimum 12-inch-thick topsoil layer. The cap is designed to keep precipitation from reaching the buried refuse, where it could interact with the refuse and contaminate groundwater. SPU completed installation of the landfill cap, methane collection system, and surface water management system in 1992; however, construction completion was not officially recognized until the Record of Decision was signed in September 2000. SPU has continued to manage and maintain the site with regular environmental reporting, including required Five-Year Review Reports by the EPA completed in 2005, 2010, 2015, and 2020.

Regulatory Database Review

The Midway Landfill is classified as a high-risk hazardous materials site. As described above, the property was added to the National Priorities List in 1986 for known groundwater and air contamination that remains at the site. A 2005 Restrictive Covenant restricts any activity that may interfere with cleanup actions, removal, or use of groundwater from any well on the property and has deed transfer and lease restrictions (EPA 2019). In March of 2020, Ecology and Sound Transit signed a Prospective Purchaser Consent Decree (PPCD) for the Midway Landfill to facilitate redevelopment of a portion of the site for the extension of light rail as part of the FWLE project. The PPCD requires Sound Transit’s work at the site to conform to Ecology’s Cleanup Action Plan Amendment (King County Superior Court 2020).

Several medium-risk hazardous materials sites were identified in the study area for the Midway Landfill Alternative. None of these sites would be acquired for this alternative, so they are not discussed further.

Historical Aerial Review

Historical aerial photographs of the Midway Landfill Alternative study area were obtained from EDR and compiled in the EDR Aerial Photo Decade Package. Aerial photographs were examined for the years 1943, 1957, 1968, 1972, 1980, 1990, 2006, 2009, 2013, and 2017. Observations are listed below.

- 1943: The area appears to be mostly undeveloped, surrounded in all directions by undeveloped, partially wooded land. Some rural residential properties are visible in the area. SR 99 is apparent to the west, Military Road is partially developed to the east, S 259th Place is developed to the south, and S 240th Street is developed to the north.
- 1957: The site appears to be an active gravel quarry. Commercial development is visible to the north, south, and west. Some residential development is visible to the far northeast.
- 1968–1980: The Midway Landfill appears to be operational (landfill operations began in 1966). I-5 is visible to the east. Development immediately to the southwest is visible. Residential and commercial development is apparent in all directions from the site.
- 1990: Landfill operations ceased in 1983, and the site was listed as an EPA Superfund site. The 1990 aerial photograph shows remedial efforts underway, including a stormwater detention pond to the north of the landfill to collect surface runoff. The surrounding area appears relatively unchanged since the 1980 aerial photograph.
- 2006–2017: The Midway Landfill appears to be filled and capped according to reported remedial efforts. The surrounding area appears to be developed similar to current conditions, with commercial, industrial, and residential development to the east, south, west, and north of the landfill.

3.13.2 Environmental Impacts

Potential impacts discussed in the following sections are from known contaminated sites and are based on the hazardous materials site's location relative to the build alternatives, focusing on hazardous materials sites within the 1/8-mile study areas. Hazardous material sites within this distance to the build alternatives have a higher probability of affecting implementation of the proposed project. Sites that pose a high risk to the build alternatives could also have long-term impacts if remediation actions are necessary after project construction.

3.13.2.1 No-Build Alternative

Under the No-Build Alternative, there would be no project-related removal or cleanup of potentially hazardous materials in the study area. However, other planned projects in the area could have hazardous materials impacts, depending on their location and past use of their respective properties. This includes TDLE, which overlaps with the OMF South Preferred and South 344th Street alternatives. If TDLE is constructed as proposed, the mainline track associated with these OMF alternatives would be built later in time. Impacts associated with construction of the mainline track are addressed within the build alternatives impacts discussion below. All other TDLE-related impacts are addressed in Chapter 4, Cumulative Effects Analysis.

3.13.2.2 Long-Term Impacts

The operation of OMF South would follow all regulations concerning the proper use and disposal of hazardous materials. However, an OMF could cause long-term impacts to the environment if an accidental release of hazardous materials, such as a fuel spill, occurs. Light rail trains operate on electricity and not fuel; however, it is likely that hazardous materials, such as lubricants, solvents, cleaning agents, and paints, would be stored at the OMF, and minor accidental releases could result during maintenance activities. The proposed OMF South would have a painting area for the trains and would need to register as an applicator with the Puget Sound Clean Air Agency.

Preferred Alternative

There are no known long-term impacts associated with hazardous materials unique to the Preferred Alternative.

South 344th Street Alternative

There are no known long-term impacts associated with hazardous materials unique to the South 344th Street Alternative.

Midway Landfill Alternative

Vapor intrusion testing would continue to be required to ensure that any occupant of the OMF South facility would not be exposed to harmful gases associated with the former landfill. Long-term exposure to even low levels of certain gases can increase the risk of chronic health issues; in extreme cases, the buildup of gases from sources such as landfills can cause acute health effects and may pose immediate risks of fire or explosion (EPA 2008).

The Midway Landfill Human Health Risk Assessment (Appendix D4) details the risks to human health associated with the Midway Landfill Alternative. The report describes the contaminants of interest and the scenarios of potential exposure to these contaminants for OMF South employees. Exposure to vapor from landfill gas would be a complete route of exposure to workers under the worst-case scenario; in other words, if engineering controls fail, vapor could intrude into indoor air. Vapor intrusion from contaminants in groundwater is not expected to adversely impact OMF South employees.

There is a high level of uncertainty regarding risks of landfill gases at the site based on the lack of sufficient data to fully characterize human health risks. The Human Health Risk Assessment recommends that additional testing of landfill gases, based on probable paths of occupational exposure, be completed to fill in these data gaps and identify other potential routes of exposure. In addition to toxicological considerations, uncontrolled release of methane gas from the landfill could pose an explosion hazard risk because the OMF South building (including below-grade pits) would have electrical equipment and live electrical overhead catenary wires that could spark or emit stray currents. Subsurface design options with greater amounts of excavation would produce lesser amounts of landfill gases. Also, a gas collection system would be required to help minimize the concern.

3.13.2.3 Construction Impacts

The hazardous materials analysis also considered direct impacts of activities associated with the construction of OMF South. The analysis considered the impacts to human health and the environment as a result of possible release of contaminants or alteration of contaminant migration pathways during construction activities and considered the effects of existing contaminated sites. Due diligence will be conducted prior to property acquisition, which will provide information about any necessary remedial actions required on the identified hazardous materials sites.

Preferred Alternative

No high-risk hazardous materials sites are within the Preferred Alternative. Based on regulatory status, acquisition level (full, partial, or no impact), or distance from the parcels being acquired, low- and medium-risk sites would not likely affect this alternative during construction. If acquired, one medium-risk site (the Bryan Property) could require additional remedial action, depending on the extent of project construction; however, based on the cleanup already conducted at the site, the amount of additional remedial action needed is expected to be little to none.

South 344th Street Alternative

No high-risk hazardous materials sites are within the South 344th Street Alternative. Based on regulatory status, acquisition level (full, partial, or no impact), or distance from the parcels being acquired, low- and medium-risk sites would not likely affect this alternative during construction. The same impact identified for the medium-risk site (the Bryan Property) would apply to this alternative.

Midway Landfill Alternative

The Midway Landfill is a high-risk hazardous materials site listed and managed as a Superfund site. Redevelopment of a property formerly used as a landfill and subject to ongoing Cleanup Action Plan and Record of Decision requirements is considered high risk for several reasons. There are potential structural challenges (foundation design and alignment of underground utilities) and environmental challenges (hazardous materials disposal; air, soil, and groundwater contamination; and rebuilding a vapor extraction system to manage risk of gas intrusion into human-occupied spaces).

Temporary impacts from construction on the Midway Landfill could include the potential release of contaminated air, soil, and groundwater. Substantial remediation, cleanup, and proper disposal of any excavated materials during construction, as well as air and groundwater monitoring in the surrounding area would be necessary. Any of the subsurface construction design options for the Midway Landfill would require Ecology and/or EPA approval to amend the existing Cleanup Action Plan and Record of Decision to confirm that the project would maintain the commitments currently in place for the landfill, including handling and disposal of excavated materials, worker health and safety, and related monitoring.

Subsurface Construction Design Options

The three subsurface construction design options for the Midway Landfill Alternative range from a structural platform with minimal excavation to a full excavation of the landfill with backfilling of competent soils. The Hybrid Subsurface Design Option would use a process called deep dynamic compaction to prepare the site for construction. In areas of the landfill containing liquid waste, compaction could cause mobilization of the contaminants.

All excavation (and installation of drilled shafts) would require the modification of the landfill gas management system and could include the exposure of workers to methane and other compounds generated by breakdown of landfill materials. The shaft drilling also presents the possibility for creating additional pathways for the downward migration of contaminants contained in leachate to the aquifer below. Section 3.11, Water Resources, considers the potential impacts to groundwater and the need for substantial remediation during construction. Remediation measures include cleanup and proper disposal of excavated materials to minimize contamination as well as groundwater monitoring in the surrounding area, with the possibility of replacing or rehabilitating the landfill membrane.

The excavation of landfill materials also has the potential to expose construction workers to contaminated materials and contaminated groundwater as well as the potential to encounter characteristic hazardous wastes. The subsurface construction design options with more substantial excavation would prolong and presumably increase these exposure risks. Additionally, the excavated material could potentially be flammable. Construction crews would need to be equipped with fire extinguishing tools and equipment. The transport of these contaminated landfill materials (and potentially hazardous wastes) via roadway and rail also presents a risk to the public in the case of a spill. These risks would increase with the volume of materials excavated and transported. Loads of landfill materials leaving the project area would be required to be covered per a project-specific contaminated media management plan.

From a beneficial impact standpoint, excavation of contaminated landfill materials from the Midway Landfill has the potential to improve local groundwater quality through reduced contact with contaminants and the potential for reduced infiltration. Any removal of the cap portion of the landfill presents the opportunity to potentially improve the cap and membrane and the landfill gas management system. The Midway Landfill is not lined and therefore there is no barrier to prevent mixing of leachate and groundwater. The benefit of fully excavating and hauling contaminated residuals from the Midway Landfill to a lined landfill located elsewhere would be the reduced potential for groundwater contamination.

3.13.2.4 Avoidance and Minimization of Impacts

A spill response program and hazardous material handling plan has been created by Sound Transit for existing maintenance locations and would be implemented during operations of the OMF South. OMF South activities that would generate hazardous materials would be managed according to all applicable regulatory requirements, which would minimize the exposure risk to all personnel and the surrounding environment.

Unexpected residual soil and groundwater contamination may be encountered during construction activities in portions of the Preferred or South 344th Street alternatives. To mitigate potential impacts from all potential hazardous material sites, Sound Transit would perform a level of environmental due diligence appropriate to the size and presumed past use at any properties in the study area before they are acquired. Sound Transit may seek certain legal protections as part of the real property acquisition process to reduce its legal and financial risk.

Construction of the Midway Landfill Alternative would encounter known areas of contamination and affect portions of the remedy currently in place for the site, including a low permeability cap, landfill gas collection system, surface water management system, and groundwater monitoring system. As a result, any of the subsurface construction design options for the Midway Landfill would require Ecology and/or EPA approval to amend the existing Cleanup Action Plan and Record of Decision to confirm that the project would maintain the commitments currently in place for the landfill, including protection against short-term impacts during construction and long-term impacts after construction. For example, this would include BMPs for the construction of drilled shafts to prevent the potential downward migration of contaminants and to prevent vapor intrusion.

If excavation of landfill materials is required, safety precautions, including personal protective equipment, air monitoring, and other best practices, would be employed to ensure the safety of workers on site. An Environmental Protection Plan would likely be required to establish procedures to manage and monitor the waste excavation and handling process, including management of stormwater and landfill gas. In addition to continuous landfill gas management, measures would need to be established to prevent air intrusion into the landfill that could result in a landfill fire. Sound Transit would prepare a Hazardous Materials Response and Sampling Plan, similar to the one prepared by SPU for FWLE construction on the western edge of the landfill (SPU 2020). The plan’s objective would be to provide an approved approach on how to identify and handle any potentially dangerous waste that could be encountered. The plan would be prepared to meet the requirements of the Cleanup Action Plan.

A project-specific Health and Safety Plan would also be required and would include stipulations that construction workers who may be exposed to potentially hazardous substances would be required to obtain the appropriate level of Hazardous Waste Operations and Emergency Response Standard (HAZWOPER) training.

The medium-risk sites identified for the three alternatives have been well characterized and would likely require no additional investigation and little or no remediation expected in addition to what has been completed. To the extent practicable, Sound Transit would limit construction activities that might encounter contaminated groundwater or soil at these sites.

Based on the due diligence process, plans for the mitigation, handling, and disposal of contaminated media and hazardous construction debris would be developed on a site-by-site basis in conjunction with the appropriate regulatory agencies. Hauling out of excavated material and construction debris would comply with regulations concerning the transport of hazardous and contaminated material, as applicable. A project-wide contaminated media management plan may also be developed and implemented.

Additionally, hazardous substances and petroleum products used during construction, such as fuels, paints, solvents, and other chemicals, would be managed and stored per the contractor's pollution control plan. BMPs would be followed in order to reduce the risk of spills, leaks, or other releases during construction activities. Construction plans and specifications developed during final design could include the following BMPs:

- Keep fueling, maintenance, and cleaning fluids in contained areas (berms, etc.)
- Minimize the production or generation of hazardous materials
- Appropriately label and store hazardous waste, per federal regulations
- Designate hazardous waste storage away from storm drains or surface water
- Recycle materials (used oil- and water-based paint) as appropriate
- Handle any potential spills of hazardous materials in conformance with applicable Material Safety Data Sheets

BMPs that address hazardous substances would be required as part of several plans that are prepared by the contractor, including the Contaminated Substances Health and Safety Plan, the Unknown Hazardous Screening and Handling Plan, the Contaminated Substances Handling Plan, and the Spill Prevention, Control, Contingency and Countermeasure Plan.

The current construction schedule assumes restrictions on excavation into the Midway Landfill during the wet season — October 1 through April 30. This would reduce the amount of precipitation that could come in contact with the exposed refuse, which then could become contaminated water that could contribute to the contaminated groundwater at the site.

3.13.2.5 Indirect Impacts

No indirect impacts related to hazardous materials are anticipated to result from construction and operation of the proposed project.

3.13.3 Mitigation Measures

Mitigation measures for the three subsurface construction design options for the Midway Landfill Alternative would vary depending on the option chosen. Common to the subsurface construction design options (except for the Full Excavation subsurface construction design option) would be the replacement of the landfill cap to prevent surface water and stormwater from entering any remaining portion of landfill. Replacement or upgrade of the landfill gas extraction system and the continuation of the landfill gas monitoring system would be required for the Platform and Hybrid options and may be required for the Full Excavation option. Additional mitigation measures would be determined in coordination with EPA and Ecology.

3.14 Public Services

This section discusses how public services could be affected by the OMF South project alternatives, such as through changes in response times for emergency services (fire, medical, and police), travel times for school bus and solid waste collection routes, and overall demand for public services. Public service providers that have facilities in the study area were also identified to determine if the facility would be displaced or emergency access would be interrupted. Analyses completed for other elements of the environment for the OMF South project were reviewed to assess potential impacts to public services, including those in Section 3.2, Transportation; Section 3.3, Acquisitions, Displacements, and Relocations; and Section 3.15, Utilities, Energy, and Electromagnetic Fields.

The study area is the area 0.5 mile from the construction limits of each build alternative. The study areas are within the jurisdictions of Des Moines, Kent, and Federal Way and include portions of unincorporated King County. There are no relevant regulatory requirements related to public services.

3.14.1 Affected Environment

3.14.1.1 Preferred and South 344th Street Alternatives

Public services within the Preferred and South 344th Street alternatives study area are shown in Figure 3.14-1. The public services are primarily the same for these two build alternatives, except for the Federal Way Public Academy, the United States Postal Service distribution center, and the Federal Way Veterans Affairs Clinic (Valor Healthcare), which are only in the South 344th Street Alternative study area.

Fire and Emergency Medical

South King Fire and Rescue (South King Fire) provides emergency management services covering approximately 41 square miles, including Des Moines, Federal Way, and a portion of unincorporated King County. Facilities include seven fire stations and one training and maintenance station. The department employs 180 personnel, of whom 157 are uniformed officers, with a minimum of 27 firefighters and emergency medical technicians on duty 24 hours a day, 7 days a week (South King Fire 2022). In the southern portion of the study area, South King Fire completed the construction of a station fleet facility at 1351 S 351st Street. In 2021, they completed the construction of a logistics building at 35100 Pacific Highway S, just outside the study area, directly west of the new station fleet facility. Future facilities expansion includes the construction of a response station at the same location of the recently constructed logistics building (South King Fire 2022).

No existing fire stations are in the study area. Fire Stations 61, 62, and 64 are the closest facilities, all less than 2 miles from the site. South King Fire is also teamed with King County's Medic One Program, and Valley Communications Center provides 9-1-1 dispatch services. According to South King Fire's 2020 Performance Report, they met their response performance goal for the first emergency medical services to be on the scene in 6 minutes about 80 percent of the time. They met their response performance goal for the first fire unit to be on the scene in 5 minutes and 30 seconds approximately 88 percent of the time (South King Fire 2020a). South King Fire is also partnered with Federal Way Emergency Management for emergency response to larger-scale emergency alerts, such as earthquakes or floods.

FIGURE 3.14-1
Public Services
Preferred and South 344th Street Alternatives

OMF South

Saint Francis Hospital is outside of the study areas to the southwest of both alternatives. It is a full-service hospital that provides diagnostic imaging and radiology; emergency services; a full range of women's health services, including a birth center; and radiation oncology. Although it is outside the build alternative study areas, it is the closest emergency room.

Police

The Federal Way Police Department provides law enforcement within the city limits. The department has 150 uniformed personnel and 36 civilian staff. In 2021, the average response time for Priority E emergencies (confirmed emergency — extensive loss of life and/or property) was 5 minutes and 49 seconds, and the average response time for Priority 1 emergencies (potential emergency — could result in loss of life and/or property) was 5 minutes and 43 seconds (City of Federal Way 2022). The closest police station is located at 33325 8th Avenue S, just outside the study area.

Federal Way is served by the Washington State Patrol Field Operations Bureau District 2, which comprises all of King County. District 2 patrols interstate and state highways within the county, including I-5 and SR 99. The Field Operations Bureau is responsible for traffic law enforcement, collision investigation, criminal interdiction, terrorism prevention, and motorist assistance (WSP 2019).

Solid Waste and Recycling

Garbage collection in the study area is provided by a city-authorized contracted hauler for occupied commercial and residential properties. All nonhazardous solid waste collected in the study area is taken directly to King County's Cedar Hills Landfill in Maple Valley or a nearby solid waste transfer station (the nearest is the Algona Transfer Station). The closest facility that accepts household hazardous waste is the South Transfer Station in Seattle, managed by SPU. A King County-operated "Wastemobile" travels to many communities in King County to provide residents a place to take their household hazardous waste periodically. The closest depository for household hazardous waste is approximately 3 miles from the study area in the parking lot of the Outlet Collection in Auburn at the intersection of SR 167 and SR 18.

School Districts/Schools

The study area includes five schools, shown on Figure 3.14-1 above and listed below. The elementary school enrollment is provided by the Washington Office of Superintendent of Public Instruction (OSPI 2022).

- Federal Way Open Doors (31455 28th Avenue S): Federal Way School District; 146 students enrolled in 2021/2022
- Federal Way Public Academy (34620 9th Avenue S): Federal Way School District; 308 students enrolled in 2021/2022 (South 344th Street Alternative only)
- Internet Academy (31455 28th Avenue S): Federal Way School District; 895 students enrolled in 2021/2022
- Pacific Christian Academy (33645 20th Avenue S): private school associated with the Christian Faith Center; 312 students enrolled in 2017/2018
- Career Academy at Truman High School (31455 28th Avenue S); Federal Way School District; 58 students enrolled in 2021/2022

Other Public Services

Other public services within the study area (Figure 3.14-1) include:

- Federal Way Department of Licensing (1617 S 324th Street)
- Federal Way Public Health Center (33431 13th Place S): The center provides health care for children with special needs, family planning, health insurance enrollment, HIV screening, pregnancy testing, teen services, and Women, Infants, and Children services
- Sea Mar Community Health Center (31405 18th Avenue S): The center provides family medicine and dentistry, behavioral health, maternity support, and a pharmacy; it is a community-based organization focused on health and social services to underserved communities
- Valor Healthcare (34617 11th Place S): The Federal Way VA Clinic provides primary care, mental health services, nursing, and social work to veterans of the armed services (South 344th Street Alternative only)
- United States Postal Service distribution center (34301 9th Avenue S) and Federal Way Post Office (32829 Pacific Highway S; South 344th Street Alternative only)

3.14.1.2 Midway Landfill Alternative

Public services in the Midway Landfill Alternative study area are shown in Figure 3.14-2.

Fire and Emergency Medical

The Puget Sound Regional Fire Authority (Puget Sound Fire) provides emergency management services covering approximately 109 square miles, including Kent, Covington, Maple Valley, and SeaTac, as well as portions of unincorporated King County. The coverage area within the Kent is 34 square miles, the entire jurisdictional boundary.

Puget Sound Fire provides emergency response service from 13 fire stations, none of which are within the project study area. The department employs a total of 350 personnel, of whom 271 are uniformed, with a minimum of 54 firefighters and emergency medical technicians on duty 24 hours a day, 7 days a week (Puget Sound Fire 2022). The study area is within the response area for Fire Station 73, used as both a fire station and police substation. Fire Station 73 is approximately 1 mile to the southeast on Military Road S in Kent. In 2021, the average response time for Priority E emergencies was 6 minutes and 18 seconds, and the average response time for Priority 1 emergencies was 6 minutes and 29 seconds (Valley Communications Center 2021).

King County's Medic One program provides advanced life-support services, and Valley Communications Center provides 9-1-1 dispatch services. Puget Sound Fire is also partnered with King County Emergency Management for emergency response to larger-scale emergency alerts, such as earthquakes or floods. There are no hospitals or emergency medical facilities in the study area.

Although the public services study area includes a portion of Des Moines, the Midway Landfill Alternative itself is outside the city limits. Puget Sound Fire would respond to incidents at OMF South if it were constructed at the Midway Landfill.

Public Services
Midway Landfill Alternative

OMF South

Police

The Kent Police Department provides law enforcement within the city limits of Kent. The department has 172 uniformed police and corrections officers and 42 support staff (City of Kent 2022). In 2021, the average response time for Priority E emergencies was 8 minutes and 50 seconds, and the average response time for Priority 1 emergencies was 7 minutes and 6 seconds (Valley Communications Center 2021). No police stations are within the project study area.

The Kent Police Department would respond to incidents at OMF South if the Midway Landfill Alternative were selected to be built. However, a multi-jurisdictional interlocal agreement is in place for law enforcement to join forces to handle specific serious criminal confrontations. This agreement includes the Port of Seattle and the municipalities of Auburn, Kent, Renton, Tukwila, and Des Moines.

Kent and Des Moines are also served by the Washington State Patrol Field Operations Bureau District 2, described previously.

Solid Waste and Recycling

Garbage collection in the study area is largely provided by a city-authorized contracted hauler, as mandated for occupied commercial and residential properties. All nonhazardous solid waste is taken directly to King County’s Cedar Hills Landfill in Maple Valley or to a solid waste transfer station (the nearest transfer station is the Bow Lake Transfer Station in Tukwila). The closest facility that accepts household hazardous waste is the South Transfer Station in Seattle, managed by SPU. A King County-operated “Wastemobile” travels to many communities to provide residents a place to take their household hazardous waste periodically. Kent Fire Station 75, approximately 10 miles from the study area, is the closest household hazardous waste depository.

School Districts/Schools

The Midway Landfill Alternative study area includes four schools, shown on Figure 3.14-2 and listed below. The elementary school enrollment is provided by the Washington Office of Superintendent of Public Instruction (OSPI 2022). Highline College enrollment information was found on the college website (Highline College 2022).

- Sunnycrest Elementary School (24629 42nd Avenue S): Federal Way School District; 505 students enrolled in 2021/2022
- Parkside Elementary (2104 S 247th Street): Highline School District; 415 students enrolled in 2021/2022
- George T. Daniel Elementary School (11310 SE 248th Street): Kent School District; 490 students enrolled in 2021/2022
- Highline College (2400 S 240th Street): approximately 13,196 students enrolled in 2020/2021

Other Public Services

The study area also includes a Washington Army National Guard location and the Sea Mar Community Health Center (Figure 3.14-1). The Washington Army National Guard is located east of I-5 at (24410 Military Road S in Kent) and serves as an armory. Sea Mar Community Health

Center (2781 S 242nd Street in Des Moines) provides family medicine and dentistry, behavioral health, maternity support, and a pharmacy. It is a community-based organization focused on health and social services to underserved communities.

3.14.2 Environmental Impacts

3.14.2.1 No-Build Alternative

Under the No-Build Alternative, impacts to public services from construction or operation of OMF South would not occur. However, other planned projects would have impacts in the OMF South study areas. This includes TDLE, which overlaps with the OMF South Preferred and South 344th Street alternatives. If TDLE is constructed as proposed, the mainline track associated with these OMF alternatives would be built later in time. Impacts associated with construction of the mainline track are addressed within the build alternatives impacts discussion below. All other TDLE-related impacts are addressed in Chapter 4, Cumulative Effects Analysis.

3.14.2.2 Long-Term Impacts

Impacts Common to All Build Alternatives

The build alternatives would not increase the population of workers or residents within the study areas in such a way that would create an increased demand for public services. Therefore, impacts related to access interruption and increased public services demand during operation would not occur.

Increased demand for police services would not occur. Security measures for each alternative would be similar to other Sound Transit OMFs. Measures would include on-site security personnel, perimeter fencing, electronically controlled gates, and security patrol in the evenings, from 5 p.m. to 5 a.m., 7 days a week. Emergency access to the mainline tracks (as applicable) and OMF site for fire, emergency medical, and police personnel would be provided.

No long-term impacts on school bus and solid waste/recycling collection routes would occur under any of the build alternatives. OMF South operations would produce solid waste and recycling. Maintenance operations would also produce hazardous waste due to the use of lubricants, solvents, and the like. Both waste streams would be managed according to all applicable regulations and requirements.

Preferred Alternative

Construction and operation of the Preferred Alternative would require the full acquisition of the Christian Faith Center campus, which houses the Pacific Christian Academy. If the facility is relocated, some students would likely have to travel farther to school. If the school discontinues operations, the approximately 312 students would either need to enroll in another private school or enter the public school system. No parcels containing public service facilities would be acquired for the mainline and lead tracks, and the tracks are designed to be elevated above all roadway intersections.

This alternative would close 20th Avenue S from S 336th Street to S 341st Place. A new roadway would be constructed on the west side of the OMF site that would extend 18th Place S to S 336th Street. It is expected that emergency vehicles would use the 18th Place S extension to access properties to the south of the site because they currently use 20th Avenue S. There would be no need for emergency services to change their operations. Therefore, there would be no adverse effects on travel or response times for public service vehicles, including fire, emergency medical, and police.

South 344th Street Alternative

There would be no anticipated adverse impacts to public services associated with the South 344th Street Alternative. No parcels containing public service facilities would be acquired for the construction or operation of the mainline and lead tracks, and these components of the alternative are elevated above all roadway intersections. Therefore, there would be minimal effects on travel or response times for public service vehicles, including fire, emergency medical, and police.

Approximately 19 acres of the Christian Faith Center's property east of 20th Avenue S would be acquired for the South 344th Street Alternative. Permanent acquisition would reduce parking and limit recreational opportunities on the campus. In addition, the presence of OMF South would be visible from portions of the school property, but at about 1,000 feet from the school building. This would not affect school uses or school operations.

This alternative would require the closure of 20th Avenue S starting 300 feet south of S 336th Street. Of all the properties that are currently served by 20th Avenue S, only the Christian Faith Center would remain after the construction of the South 344th Street Alternative. Because 20th Avenue S is used as an alternative route for by-passing traffic on SR 99, fire, police, and emergency response access would be changed.

Travel times were estimated for emergency service vehicles traveling from four emergency response origins to the Christian Faith Center property, as shown in Figure 3.14-3. The four emergency response origins include:

1. Federal Way Police Department, located near S 334th Street and 8th Avenue S
2. South King Fire and Rescue Station 64, located near S 320th Street and Military Road S
3. Proposed future Fire and Rescue Station, located near the new logistics building at 35100 Pacific Highway S
4. South King Fire and Rescue Station 61, located near S 360th Street and 32nd Avenue S

The Federal Way Police Department was used to represent travel from the northwest quadrant of the South 344th Street Alternative study area. The three fire and rescue stations represent travel from the northeast, southwest, and southeast quadrants of the South 344th Street Alternative study area.

FIGURE 3.14-3
Emergency Response Routes
South 344th Street Alternative

OMF South

Emergency response travel times were estimated between each of the four emergency response origin points and the Christian Faith Center property. For each emergency response origin point, travel times were estimated for a route along 20th Avenue S and a route along SR 99, as applicable. Emergency response travel times were calculated by estimating the time to travel along the roadway segments and the delay at signalized intersections. For both off-peak and peak periods, the time to travel along the roadway segments was estimated based on posted speed limit and length of the segment. For off-peak periods, it was assumed that emergency response vehicles would travel through without delay. For peak periods, it was assumed that emergency response vehicles would experience approximately 15 seconds of delay at each signalized intersection.

Table 3.14-1 summarizes the estimated emergency response travel times between the four emergency response origins and the Christian Faith Center property.

Table 3.14-1 Emergency Response Travel Times: South 344th Street Alternative

Emergency Response Route	Study Area Quadrant	Route Type	Route Length (miles)	Off Peak Period Travel Time (minutes)	Peak Period Travel Time (minutes)
Federal Way Police Department	NW	20th Ave S	1.1	1.9	2.9
		SR 99	N/A	N/A	N/A
South King Fire and Rescue Station 64	NE	20th Ave S	1.7	2.9	3.4
		SR 99	N/A	N/A	N/A
Proposed future South King Fire and Rescue Station	SW	20th Ave S	1.3	2.4	3.2
		SR 99	1.3	2.2	3.5
South King Fire and Rescue Station 61	SE	20th Ave S	2.7	4.9	6.4
		SR 99	2.8	4.8	7.0

Emergency vehicles traveling from the proposed future Fire and Rescue Station and South King Fire and Rescue Station 61 would be required to use the routes along SR 99 with the closure of 20th Avenue S. For the proposed future Fire and Rescue Station, using SR 99 instead of 20th Avenue S would decrease travel time by 0.2 minutes (12 seconds) during off-peak periods and increase travel time by 0.3 minutes (18 seconds) during peak periods. For the South King Fire and Rescue Station 61, using SR 99 instead of 20th Avenue S would decrease travel time by 0.1 minutes (6 seconds) during off-peak periods and increase travel time by 0.6 minutes (36 seconds) during peak periods.

Emergency vehicles traveling from the Federal Way Police Department and South King Fire and Rescue Station 64, both located north of the South 344th Street Alternative, would use the existing street network to access the Christian Faith Center property. Areas south of the South 344th Street Alternative are expected to be served by the proposed future Fire and Rescue Station and South King Fire and Rescue Station 61.

With suitable options for emergency access, the ability to shift first-response service boundaries, and a planned future fire station, South King Fire considers the closure of 20th Avenue S to have minimal impact on fire and emergency medical services (South King Fire 2020).

Federal Way reported that all parcels surrounding 20th Avenue S are served by their police department and expressed concern over the potential effects that the closure of 20th Avenue S could have on police response time. According to data provided by the city, Federal Way police patrolled 20th Avenue S between S 336th Street and S 341st Place an average of two to three times per day from March through September 2022 (City of Federal Way 2023).

Because police officers are often traveling on patrol and not dispatching from a central location to respond to calls, it is not possible to accurately determine how the road closure would affect their response time. The majority of Federal Way is located west of the project site. With the South 344th Street Alternative located toward the eastern edge of the city limits, police patrol vehicles would likely be either north, south, or west of 20th Avenue S most of the day; thus, the closure would likely have very little impact on their response time to the area currently served by 20th Avenue S. Further, some of the businesses and residences served by 20th Avenue S would be acquired for the project, reducing the number of properties needing emergency services in the immediate area.

The closest hospital to the South 344th Street Alternative is St. Francis Hospital, at S 345th Street and 9th Avenue S. Because the hospital is southwest of the project site, emergency vehicle response times would not be affected by the closure of 20th Avenue S.

Midway Landfill Alternative

Impacts under the Midway Landfill Alternative would be the same as those discussed above under Impacts Common to All Build Alternatives. There would be no anticipated adverse impacts to public services.

3.14.2.3 Construction Impacts

Impacts Common to All Build Alternatives

Implementation of any of the build alternatives would temporarily affect the roadways in the study area and vicinity, resulting in short-term impacts on emergency services. Construction vehicles would temporarily increase traffic congestion. The Midway Landfill Alternative, with its relatively long construction schedule and large number of truck trips, would potentially have the largest effect on emergency service response times and public service delivery. Sound Transit would coordinate with potentially affected public service providers before and during construction to minimize delays in emergency response times and disturbance to school bus and solid waste collection routes.

3.14.2.4 Avoidance and Minimization of Impacts

The OMF South alternatives would be designed within a framework of standards that address emergency, safety, and security at each facility. Operations at OMF South would be performed in accordance with a facility operations plan that would ensure safety and security at the site. Sound Transit would also work with the local jurisdictions to develop an emergency response, safety, and security plan.

As discussed in Section 3.2, Transportation, construction-related traffic impacts would be addressed with implementation of a construction transportation management plan prepared through coordination with the affected jurisdiction prior to construction. Sound Transit would coordinate with potentially affected public service providers before and during construction to minimize delays in emergency response times and minimize disturbance to school bus and solid waste collection routes.

For the South 344th Street Alternative, due to the closure of 20th Avenue S, police and fire services would likely use SR 99 to access areas north and south of the OMF site. The use of

SR 99 as an alternate route would not substantially affect response times. Sound Transit would work with Federal Way during final design to develop measures to address this concern, which could include constructing a new roadway connection between S 336th Street and S 341st Place.

3.14.2.5 Indirect Impacts

The OMF South build alternatives could have indirect impacts to their respective study areas, including changes in development patterns which could affect the need for public services. Section 3.4, Land Use, contains a more detailed description of direct and indirect land use changes in addition to development potential consistent with local and regional policies and plans.

3.14.3 Mitigation Measures

No mitigation is anticipated for impacts to public services as a result of construction or operation of OMF South. Section 3.3, Acquisitions, Displacements, and Relocations, provides details regarding acquisition and relocation assistance for property owners and businesses, including those that provide public services.

3.15 Utilities, Energy, and Electromagnetic Fields

Utilities

The study area for the utility analysis is the area in the construction limits of the build alternatives. Information on relocated or protected utility lines was compiled from several sources, including GIS data from Sound Transit, Federal Way, and Kent; utility maps; and as-built drawings obtained from private and public utility companies. A field survey was also completed to confirm and map many of the utilities for the Preferred and South 344th Street alternatives.

Sound Transit inventoried major utility lines to identify potential conflicts that might require utility relocation. Major utilities were defined as:

- Water mains of 16-inch diameter or greater
- Stormwater drains and sanitary sewers of 36-inch diameter or greater
- Sanitary sewer force mains of 24-inch diameter or greater
- 115 kilovolt (kV) and greater electrical transmission lines
- High-pressure gas mains of any diameter
- Intermediate-pressure gas lines with an 8-inch diameter or greater
- Telephone and fiber-optic duct banks with three or more conduits
- Petroleum product pipelines

Utilities within the study area are regulated by Federal Way and Kent, as well as Lakehaven Water and Sewer, Highline Water, and Midway Sewer districts.

Energy

The study area for the energy analysis is the area in the construction limits of the build alternatives. The energy analysis evaluated operational energy used by the build alternatives and the demand on energy supply and energy consumption during construction.

Many federal, state, and local plans and policies identify goals for the efficient use of energy. Sound Transit's Sustainability Plan commits Sound Transit to integrating efficient operating practices at existing and new facilities, using energy-saving equipment to reduce energy demand, and maximizing intermodal transit connections to reduce automobile travel (Sound Transit 2019d). It includes goals focused on sustainable building and infrastructure and opportunities for transit-oriented development.

Electromagnetic Fields

The electromagnetic field (EMF) study area is the area immediately adjacent (300 feet) to the construction limits of the build alternatives. The EMF analysis discusses potential for electromagnetic fields from the build alternatives to interfere with the operation and function of sensitive equipment. Facilities with equipment potentially sensitive to electromagnetic interference were identified in the study area using a review of existing facilities, buildings, and land uses.

Electromagnetic fields are created by the generation, transmission, distribution, and use of electricity. Electromagnetic fields surround all electrical equipment, appliances, and facilities, including light rail trains. Additionally, metal objects, such as trucks and buses, move through the earth's static magnetic field creating electromagnetic fields. Electromagnetic fields can result in electromagnetic interference, which can cause disruption and possibly malfunction in sensitive equipment, such as magnetic resonance imaging (MRI) equipment, electron microscopes, mass spectrometers, and magnetic devices such as heart pacemakers.

In certain situations, with sufficiently high exposure, EMFs can affect human health by causing, for example, shocks or burns when objects that conduct electricity are touched. The World Health Organization, however, has concluded that "current evidence does not confirm the existence of any health consequences from exposure to low level electromagnetic fields" (World Health Organization 2019). The impact discussion, therefore, focuses on the potential interreference with sensitive equipment as well as the potential impact of stray currents.

In electrical systems such as Sound Transit's Link light rail system, current can flow from the system into nearby ground or concrete structures, resulting in "stray current." Stray currents can occur when part of an electric current finds an alternative conducting path, such as metal, water, or a buried pipe or cable. Over time, a stray current can cause corrosion, which in turn can cause pipes to leak or wires to break.

3.15.1 Affected Environment

3.15.1.1 Utilities

Utility providers include municipal agencies, public utility districts, and private franchise utility companies. Table 3.15-1 summarizes the utility providers in the study area.

Table 3.15-1 Utility Providers in Study Area

Utility	Provider
Preferred and South 344th Street Alternatives	
Gas	Puget Sound Energy
Electricity	Puget Sound Energy
Water, Sewer	Lakehaven Water and Sewer District
Stormwater	Federal Way Public Works
Cable	Comcast
Communications	Lumen, Zayo, Verizon/MCI
Midway Landfill Alternative	
Gas	Puget Sound Energy
Electricity	Puget Sound Energy
Water	Highline Water District
Sewer	Midway Sewer District
Stormwater	Kent Public Works
Cable	Comcast
Communications	Lumen, Zayo

3.15.1.2 Energy

In 2019, Washington consumed 2,076 trillion British thermal units (Btu) of energy. Transportation accounts for 32 percent of energy consumption in Washington, followed by the industrial (26 percent), residential (24 percent), and commercial sectors (18 percent) (EIA 2022).

Per capita energy consumption, in general, is declining due to improvements in energy efficiency and design as well as the decline in industrial energy consumption (Washington State Department of Commerce 2018). Despite this reduction in per capita energy use, the state's overall energy consumption is expected to increase over the next several decades due to growth in population, jobs, and demand for vehicle travel (Washington State Department of Commerce 2020). However, meeting the state's GHG emission limits may result in lower overall energy demand by increasing energy efficiency and electrification to replace GHG-emitting fuels (Washington State Department of Commerce 2020a). Increased demand for energy is closely tied to energy prices; if prices remain high, the growth in energy demand may be moderated by consumers who purchase fuel-efficient vehicles or change personal consumption habits (Washington State Department of Commerce 2018).

Puget Sound Energy (PSE) provides both power and natural gas to the study area. Table 3.15-2 lists the number of customers and sales by energy type for PSE's service area, which is approximately 6,000 square miles (PSE 2022).

Table 3.15-2 2019 Utility Data for Puget Sound Energy

Utility Data	Electricity	Natural Gas
Number of Customers	1,173,909	841,197
Energy Sales	20,014,275 MWh	95,104 billion Btu[1]

Sources: PSE 2019a, 2020

Note:

(1) Reported by PSE (2019) as 951,042,707 therms and converted using the relationship 10 therms = 1 million British thermal units (Btu).

In addition to its own generation sources, PSE purchases additional energy through short-, medium-, and long-term contracts with other energy producers and suppliers. In 2019, coal represented 32 percent of PSE's electricity fuel mix, followed by natural gas (28 percent), hydropower (17 percent), unspecified (13 percent), wind (8 percent), nuclear (< 1 percent), and other (< 1 percent) (Washington State Department of Commerce 2020b). However, as stated in Section 3.8, Air Quality and Greenhouse Gas Emissions, Sound Transit and PSE have entered into an agreement that all electricity accounts related to the operations of Link light rail be sourced solely from renewable wind power via PSE's Green Direct program.

Natural gas is purchased by PSE for both electricity generation and delivery to customers. Future increases in electricity and natural gas sales are expected in the Puget Sound region. PSE's 2019 base forecast for the next 20 years includes a 1.4 percent average annual growth rate for electricity and a 0.7 percent rate for natural gas (PSE 2019b).

3.15.1.3 Electromagnetic Fields

Communities in the study area are served by a combination of overhead and buried electric distribution lines providing power to the existing commercial, industrial, and residential uses in the areas. There are also BPA 500 and 230 kV high-voltage transmission lines located just south of The Commons at Federal Way shopping mall.

All electrical equipment and electronic devices generate EMFs. The widespread use of electricity in homes and businesses means that EMFs are present almost everywhere. Electric fields in the home, on average, range from 0 to 10 volts per meter, and electric fields directly beneath power lines may vary from a few volts per meter for some overhead distribution lines to several thousand volts per meter for extra-high-voltage power lines (NIEHS and NIH 2002).

Sound Transit did not identify any EMF-sensitive facilities, buildings, or land uses within the study areas of the build alternatives.

3.15.2 Environmental Impacts

3.15.2.1 No-Build Alternative

Under the No-Build Alternative, impacts to utilities and energy and from construction or operation of OMF South would not occur. However, other planned projects would have impacts in the OMF South study areas. FWLE required utility relocations in the Midway study area, but additional electrical system capacity was not required. Additionally, there were no EMF impacts from the construction of FWLE. Other planned projects could require utility relocation, depending on their design. This includes TDLE, which overlaps with the OMF South Preferred and South 344th Street alternatives. If TDLE is constructed as proposed, the mainline track associated with these OMF alternatives would be built later in time. Impacts associated with construction of the mainline track are addressed within the build alternatives impacts discussion below. All other TDLE-related impacts are addressed in Chapter 4, Cumulative Effects Analysis.

3.15.2.2 Long-Term Impacts

Impacts Common to All Build Alternatives

Utilities

Operation of OMF South would result in a negligible increased demand for natural gas and for cable and communications systems.

Each build alternative would include an on-site traction power substation to power the LRVs for movement around the yard and transporting them back to the mainline tracks. The daily power demand for tools and machinery in the vehicle maintenance shops, along with the storage yard lighting and other on-site electricity needs, would be supplied from the site’s power service feed off the main local grid. The on-site traction power substation would be powered by 12.5 kV electric lines connecting to the nearest power pole. Increased electricity demand at OMF South may require additional distribution lines to be constructed and maintained by PSE. The Energy discussion below contains more information.

For each of the build alternatives, water demand would increase slightly, most of it for LRV washing. A high percentage of this wash water would be recycled on site. The additional water demand would not greatly affect the water providers’ existing and projected water supplies and would not likely compromise flow for fire protection. Water demand would be coordinated with fire departments and water suppliers to avoid impacts. The OMF South drainage system would be designed to filter and recycle a high percentage of the wash and rinse water. Solids, oils, soaps, and other contaminants would be filtered, settled into a sludge tank, and periodically removed for disposal in accordance with applicable regulations.

Some disposal to the local sanitary sewer system would be expected from the recycled, filtered wash water. The water discharged to the sanitary sewer system would be disposed in accordance with local and state regulations. For each of the build alternatives, existing sewer lines on adjacent streets are available for sewer connections. Nonrecycled vehicle wash water disposal volumes would be compared with conveyance capacity of the existing system. On-site filtering and recycling capacity would be developed in more detail during the final design to ensure compatibility with the existing system.

Any required stormwater detention facilities and infrastructure to collect storm and wastewater would connect to both the existing sewer system and the stormwater conveyances. Operational impacts on stormwater are discussed in Section 3.11, Water Resources.

Energy

Table 3.15-3 shows the estimated aggregate annual operational and maintenance energy consumption for the build alternatives.

Table 3.15-3 Estimated Aggregate Annual Operational and Maintenance Energy Consumption for OMF South Build Alternatives

Alternative	Estimated Aggregate Annual Energy Consumption (million Btus)	Megawatt hours
Preferred	16,235	4,758
South 344th Street	16,249	4,762
Midway Landfill	16,139	4,730

OMF South operations would increase energy consumption equivalent to the requirement for up to 211 homes for the Preferred and South 344th Street alternatives and up to 209 homes for the Midway Landfill Alternative. Given that these increases represent a small fraction of PSE’s total energy resources (less than 0.03 percent of PSE’s annual sales of more than 20.0 million megawatt hours), the utility should have sufficient capacity and energy resources to accommodate the increases.

EMF

There are no properties with sensitive equipment in the study area, so no long-term EMF impacts on sensitive equipment are expected from any of the build alternatives.

The build alternatives would increase EMF levels from existing conditions due to the increase of EMF-generating sources, including the LRVs; overhead catenary wires used to provide power to the mainline, test tracks, and tracks within the OMF site; equipment to operate the facility and maintain the LRVs; and an on-site traction power substation facility.

Stray currents could result if electrical current traveling through the LRVs or overhead wires were to jump to nearby cables that are buried in the ground. Control measures preventing stray currents would be developed by Sound Transit, if necessary, in coordination with the operators of electric and other utility lines.

The build alternatives would not result in any health impacts on facility employees, visitors, or the surrounding public. Even when drawing full power, data from similar rail systems show that light rail operation is unlikely to generate health impacts for people along the tracks from EMF exposure (Sound Transit 2016). The ranges of EMF exposure to track maintenance workers and train operators are below the guidelines established by the International Commission on Non-Ionizing Radiation Protection. Because maintenance workers and operators would be in the immediate vicinity of electrical equipment generating EMFs, the EMF exposure to the public in surrounding land uses from the build alternative sites would be lower than train-worker exposure.

The magnetic field from light rail operations on the mainline and test tracks would not exceed 10 gauss, which is a unit of magnetic induction that measures the intensity of a magnetic field. This level is less than 1/100th of the exposure considered safe for human health by the Institute of Electrical and Electronics Engineers (2019).

Preferred Alternative

Utilities

In addition to the on-site traction power substation described above under Impacts Common to All Alternatives, the Preferred Alternative would require an additional traction power substation to power the mainline tracks. Like the on-site traction power substation, it would be powered by 12.5 kV electric lines connecting to the nearest power pole. Increased electricity demand at this traction power substation site may require additional distribution lines to be constructed and maintained by PSE.

To accommodate the mainline tracks, BPA's existing 500 and 230 kV high-voltage transmissions lines that are just south of The Commons in Federal Way would be modified to avoid potential effects on light rail operations. These modifications would include the installation of new towers to raise and shift the lines.

Energy

Operational impacts on energy resulting from the Preferred Alternative would be the same as those discussed above under Impacts Common to All Build Alternatives.

EMF

Operational impacts from EMF for the OMF site are the same as those described previously under Impacts Common to All Build Alternatives.

As noted above, the BPA 500 and 230 kV high-voltage transmission lines just south of The Commons in Federal Way would be modified. These modifications would include installation of new towers to raise and shift the location of each line. Both electric and magnetic field levels are expected to be well below threshold limits at the approximate edge of the BPA right-of-way for the modified portion.

LRVs approaching the OMF on the mainline tracks or running on the test track under the Preferred Alternative could be traveling up to the maximum operating speed of 55 mph. A report prepared by LTK Engineering Services (2006) describes extensive measurements and magnetic field modeling performed for the North Link line in Sound Transit's Link light rail system to evaluate magnetic fields that could be produced by operation of four-car trains. Even with the higher speeds, EMF levels expected within and adjacent to the LRVs along the mainline or test tracks would be considerably lower than exposure guidelines. It is important to note that, because these trains are moving, the resulting magnetic fields are transient in nature, typically lasting from a fraction of a second to a few seconds.

South 344th Street Alternative

Utilities

Operational impacts to utilities are the same as those described under Impacts Common to All Build Alternatives and the Preferred Alternative.

Energy

Operational impacts on energy resulting from the South 344th Street Alternative would be the same as those discussed above under Impacts Common to All Build Alternatives.

EMF

Operational impacts from EMF are the same as those described previously under Impacts Common to All Build Alternatives and the Preferred Alternative.

Midway Landfill Alternative

Long-term impacts to utilities, energy, and EMF from the Midway Landfill Alternative would be the same as those discussed above under Impacts Common to All Build Alternatives.

3.15.2.3 Construction Impacts

Impacts Common to All Build Alternatives

Utilities

Potential construction impacts common to all build alternatives would include:

- Relocating utility poles that support overhead lines; relocating aerial utility lines to taller or different types of poles (including the BPA 500 and 230 kV high-voltage transmission lines for the Preferred and South 344th Street alternatives); constructing new distribution lines to provide power to substations
- Relocating underground utilities out from under future OMF South site facilities
- Inspecting, repairing, and encasing underground utilities at yard track crossings

The effect on utilities is dependent on their depth and material as well as excavation and fill limits of the build alternative sites. Underground utilities would be relocated or protected to allow for excavation and/or fill and to minimize load impacts on existing utilities from the weight of the LRVs and building foundations.

Disruptions to service during utility relocations would be minimal, as temporary connections to customers would typically be established before starting relocation. Inadvertent damage to underground utilities could occur during construction if utility locations are uncertain or misidentified. Such accidents could temporarily affect service to the utilities' customers. Preconstruction surveys, and outreach measures to inform customers of potential disruptions would be used to minimize these impacts.

Construction of distribution systems within the site boundaries for electric, natural gas, water, communications, sanitary sewer, and stormwater would be achieved through relocation and reuse of existing systems as well as installation of new systems. Specific requirements for the on-site distribution systems would be determined during final design.

Table 3.15-4 summarizes the potential impacts to utilities from construction of OMF South for each build alternative. Utilities designated as "relocated" would need to be replaced to maintain the current level of service. "Removed" utilities are ones that could possibly be removed but may not need to be replaced due to the change in land use or required service. "Protected" utilities could be left in place and not affected by construction.

The full extent of utility relocations would be determined during final design. Relocations may require work outside the proposed project limits to complete connections back to existing systems and maintain levels of service as required for a successful utility relocation.

Table 3.15-4 Summary of Utility Impacts for OMF South Build Alternatives

Utility Type	Preferred Alternative	South 344th Street Alternative	Midway Landfill Alternative
Water Main Distribution	5,150 feet relocated 3,360 feet removed	5,450 feet relocated 3,930 feet removed	None
Sanitary Sewer Conveyance	2,376 feet relocated 200 feet removed	4,980 feet relocated 1,060 feet removed	None
Stormwater Collection	14,866 feet relocated 260 feet removed	14,570 feet relocated 1,800 feet removed	None
Electricity	3,450 feet of underground electrical relocated 2,000 feet of underground electrical removed 560 feet of overhead electrical removed	2,420 feet of underground electrical relocated 1,560 feet of underground electrical removed 2,140 feet of overhead electrical relocated 520 feet of overhead electrical removed	None
Natural Gas	2,100 feet relocated	3,290 feet relocated 390 feet removed	None
Cable/Telecommunications	1,950 feet of underground telecom protected[1] 3,880 feet of underground telecom relocated 560 feet of overhead telecom relocated 4,710 feet of underground telecom removed	9,440 feet of underground telecom relocated 1,720 feet of underground telecom removed 4,240 feet of overhead telecom relocated 370 feet of overhead telecom removed	None
Petroleum/Fuel	None	None	None
Other Utilities	None	None	Up to 15,740 feet of the landfill gas extraction system removed and replaced[2]

Notes: All lengths are approximate and will be determined during final design.

(1) Existing telecom ducts can likely be protected in place but may need to be relocated, depending on construction means and methods.

(2) Existing waste produced gaseous ventilation system; length of system modification depends on the subsurface construction design option.

Energy

Energy-related impacts during construction of the OMF South would be short term in nature and are not anticipated to be adverse. During project construction, energy would be consumed when construction materials are produced and transported to the project construction site. Operating and maintaining construction equipment would also consume energy. Table 3.15-5 summarizes estimated total energy consumption (i.e., construction equipment fuel consumption; material and fuel extraction, production, and transport; and soil import/export) associated with construction of the build alternatives. Total energy consumption estimates were calculated based on amortized construction GHG emission estimates. See Section 3.8, Air Quality and Greenhouse Gas Emissions, for details.

Table 3.15-5 Total Construction-Related Energy Consumption

Build Alternative	Gallons of Diesel Fuel[1]	Million Btu[2]
Preferred Alternative		
OMF Site	6,196,714	851,311
Mainline	556,115	76,400
Total	**6,752,829**	**927,710**
South 344th Street Alternative		
OMF Site	6,271,193	861,543
Mainline	665,352	91,407
Total	**6,936,545**	**952,950**
Midway Landfill Alternative		
Platform	7,308,944	1,004,110
Hybrid	9,295,070	1,276,966
Full Excavation	9,652,573	1,326,080

Notes:

(1) Upstream, downstream, and haul truck GHG emissions from the air quality analysis (Table 3.8-4) were used to estimate energy consumption.

(2) 1 U.S. gallon of diesel fuel = 137,381 Btu (EIA 2019).

EMF

During construction, EMFs would be generated by equipment use and movement of construction vehicles. However, EMFs would not be substantially higher than those generated at a typical construction site. Additionally, because there are no facilities with EMF-sensitive equipment in the study area, no impacts from EMF are anticipated during construction.

Preferred Alternative

Utilities

This build alternative would require a portion of 24th Avenue S near its intersection with S 330th Street to be realigned and rebuilt to make room for the proposed mainline track alignment for either design option. The realignment of the road would have impacts on an existing 30-inch sewer main between the street and I-5 while also impacting the existing overhead electrical poles, wiring, and associated telecom lines along the east side of the street. For impacts of this magnitude, Federal Way requires existing overhead utilities to be converted to underground. The new mainline and test tracks would also have minor impacts on several other utilities along its proposed alignment until it reaches the OMF site. Table 3.15-6 summarizes those impacts and provides additional information about the existing utilities that would potentially conflict with the mainline tracks.

Table 3.15-6 Preferred and South 344th Street Alternatives Mainline Utility Impacts Summary

Utility Type	Length	Utility Owner	Utility Size	Utility Material	Mainline Impact[1]	Relocate/ Protect
Underground Electrical Distribution	Crossing	PSE	Unknown	PVC conduit	Column	R
Water Main	31	Lakehaven Water and Sewer District	16 inches	DI	Column	R
Sanitary Sewer Main	36	Lakehaven Water and Sewer District	12 inches	CI	Column	R
Sanitary Sewer Main	240	Lakehaven Water and Sewer District	30 inches	PVC	Column	R
Gas Main	31	PSE	2 inches	MDPE	Column	R
Underground Electrical Distribution	223	PSE	Unknown	PVC conduit	Column	R
Sanitary Sewer Main	Crossing	Lakehaven Water and Sewer District	8 inches	PVC	Column	R
Overhead Electrical Transmission	Crossing	BPA	500 kVA and 230 kVA	Wires	Mainline	R
Overhead Electrical Transmission	Crossing	BPA	230 kVA and 230 kVA	Wires	Mainline	R
Water Main	2,730	Lakehaven Water and Sewer District	2 inches	Poly	Test Track, Drainage Pond and Fill Walls	R
Sanitary Sewer Main	675	Lakehaven Water and Sewer District	Private	Unknown	Test Track and Fill Walls	R
Telecom Duct Bank	622	Lumen (formerly) CenturyLink)	1 duct	PVC conduit	Test Track and Fill Walls	R
Underground Electrical Distribution	492	PSE	100 kVA	PVC conduit	Test Track and Fill Walls	R
Gas Main	482	PSE	2 inches	Steel	Test Track and Fill Walls	R
Underground Electrical Distribution	185	PSE	75 kVA	PVC conduit	Drainage Pond	R
Water Main	287	Lakehaven Water and Sewer District	2 inches	Poly	Drainage pond and Column	R
Telecom Duct Bank	2,123	Lumen	1 duct	PVC conduit	Test Track, Fill Walls & Drainage Pond	R
Water Main	Crossing	Lakehaven Water and Sewer District	2 inches	Poly	Test Track and Fill Walls	R
Telecom Duct Bank	1,027	Lumen	1 duct	PVC conduit	Drainage Pond	R
Gas Main	188	PSE	2 inches	Steel	Drainage Pond	R
Underground Electrical Distribution	265	PSE	50 kVA	PVC conduit	Drainage pond	R
Underground Electrical Distribution	290	PSE	50 kVA	PVC conduit	Drainage pond	R

Table 3.15-6 Preferred and South 344th Street Alternatives Mainline Utility Impacts Summary (continued)

Utility Type	Length	Utility Owner	Utility Size	Utility Material	Mainline Impact[1]	Relocate/ Protect
Overhead Electrical Distribution	1,100	PSE	25 kVA	Wires	At grade	R
Overhead Telecom Lines	1,100	Lumen	1 aerial	Wires	At grade	R
Cell Tower	Crossing	Seattle SMSA LP	1 tower	N/A	Obstruction	R
Telecom Service[2]	Crossing	Lumen	1 service	Buried	At grade	R
Sanitary Sewer Main	Crossing	Lakehaven Water and Sewer District	30 inches	Concrete	Retained fill	R
Water Main	Crossing	Lakehaven Water and Sewer District	6 inches	Cast iron	Retained fill	R
Overhead Telecom Lines	Crossing	Comcast	Aerial	Wires	Mainline	R
Overhead Electrical Distribution	Crossing	PSE	25 kVA	Wires	Mainline	R
Telecom Duct Bank	Crossing	Lumen	3 ducts	PVC conduit	Column	P
South 344th Street Alternative, Enchanted Parkway Tail Track Option						
Overhead Telecom Lines	Crossing	Comcast	Aerial	Wires	Mainline	R
Overhead Electrical Distribution	Crossing	PSE	25 kVA	Wires	Mainline	R
Telecom Duct Bank	Crossing	Lumen	3 ducts	PVC conduit	Column	P
Water Main	Crossing	Lakehaven Water and Sewer District	8 inches	DI	Column	R
Underground Electrical Distribution	Crossing	PSE	25 kVA	PVC conduit	Column	R
Gas Main	Crossing	PSE	2 inches	MDPE	Column	R
Telecom Duct Bank	Crossing	Comcast	unknown	PVC conduit	Column	R
South 344th Street Alternative, I-5 Tail Track Option						
Overhead Electrical Distribution	Crossing	PSE	25 kVA	Wires	Mainline	R
Overhead Telecom Distribution	Crossing	Comcast	Aerial	Wires	Mainline	R
Telecom Duct Bank	Crossing	Lumen	3 ducts	PVC conduit	Column	P

Notes: All lengths are approximate; CI = cast iron; DI = ductile iron; kVA = kilovolt-amp; MDPE = medium-density polyethylene; Poly = polyethylene; PVC = polyvinyl chloride; R = Relocate, P = Protect.

(1) If neither the Preferred nor the South 344th Street alternative is selected, the mainline could be built later in time if TDLE is constructed as proposed. TDLE is currently under environmental review.

(2) Existing service to a building that would be demolished for project; new service/replacement is not anticipated due to building removal.

The mainline tracks would also intersect with the location of the existing BPA electrical transmission corridor and would have to cross under the existing lines. This intersection creates a vertical conflict between the proposed mainline tracks and the existing power line elevations. The transmission lines would need to be raised by approximately 50 feet. BPA has determined that the existing towers are unable to accommodate this change and four new towers are needed. Sound Transit and BPA are working together to address this conflict. BPA estimates the work would take two construction seasons and would require planned power interruptions to allow crews to safely make improvements to the lines. BPA would work with the local utility to select a time with as minimal an impact on the community as possible (BPA 2023).

The mainline tracks would be located near an existing cell tower adjacent to I-5, 24th Avenue S, and Oakland Hills Boulevard. The completed mainline tracks could block or interfere with cell tower transmission waves, which would cause a service disruption. The tower would likely be relocated to available open property further to the west of the project rather than next to I-5.

Energy

As shown in Table 3.15-5, the Preferred Alternative is anticipated to have similar level of fuel consumption relative to all the build alternatives.

EMF

Construction impacts from EMF for this alternative are the same as those described previously under Construction Impacts Common to All Build Alternatives.

South 344th Street Alternative

Utilities

Potential impacts related to construction of the mainline tracks would be the same as those described above for the Preferred Alternative.

Both the Enchanted Parkway and the I-5 mainline tail track alignments would impact electrical utilities. At the end of S 344th Street on the east side of I-5, overhead distribution electrical power and telecom lines are in vertical conflict with the tracks. Taller poles would be necessary to raise the lines clear of the elevated mainline tracks.

Energy

As shown in Table 3.15-5, the South 344th Street Alternative is anticipated to result in a similar level of fuel consumption relative to all the build alternatives.

EMF

Construction impacts from EMF for this alternative are the same as those described previously under Construction Impacts Common to All Build Alternatives.

Midway Landfill Alternative

Utilities

No conflicts associated with natural gas were identified for the Midway Landfill Alternative site. New gas distribution piping would be constructed within the site boundary to service the OMF South buildings.

The Midway Landfill has approximately 15,740 feet of 6-inch-diameter PVC pipe in a landfill gas ventilation piping system. Located underneath the landfill cap, the system is designed to capture methane and other decay gases that are produced as the buried waste breaks down. After the gas is collected, it is mixed with natural gas to allow combustion and then flared off at an on-site facility. If the Midway Landfill Alternative is selected, this system would be modified or removed. Depending on the subsurface construction design option, the site preparation work would remove some or all of the landfill. Replacement or upgrade of the landfill gas extraction system and the continuation of the landfill gas monitoring system would be required for the Platform and Hybrid subsurface construction design options and may be required for the Full Excavation option.

No conflicts associated with underground or overhead electrical infrastructure, water main piping, sanitary sewer piping, storm drain piping, or telecommunication infrastructure were identified for the Midway Landfill Alternative. New piping and infrastructure for these utilities would be constructed within the site boundary to service the OMF South buildings.

Energy

As shown in Table 3.15-5, the subsurface construction design options associated with the Midway Landfill Alternative are anticipated to result in higher levels of fuel consumption relative to the other build alternatives.

EMF

Construction impacts from EMF for this alternative are the same as those described previously under Construction Impacts Common to All Build Alternatives.

3.15.2.4 Avoidance and Minimization of Impacts

Sound Transit used several design measures to avoid and minimize potential utility impacts. For example, where feasible, columns for elevated mainline tracks would be placed to avoid impacts to underground utilities. Sound Transit would also design the mainline tracks to maintain access to utilities for maintenance and repair per the utility owner’s requirements. In some cases, that would require Sound Transit to relocate sewer manholes, pipes, vaults, or other access points as part of mainline track construction. Sound Transit would work closely with utility providers to maintain required access to these utilities and any relocated sewer manholes and vaults, utility mains, fire hydrants, and other features. To minimize potential impacts due to service disruptions during construction, Sound Transit would perform preconstruction surveys to identify utility locations as well as communicate with customers to inform them of planned or potential service disruptions.

To avoid or minimize potential corrosion impacts, Sound Transit would coordinate with utility providers during final design to identify appropriate control measures. Typical design measures include:

- Installing cathodic protection systems
- Installing insulating unions to break the electrical conductivity of the utility
- Isolating electrical rails from the ground
- Installing stray-current-control track fastening systems, where appropriate

To avoid or minimize consumption and demand on utilities, such as energy and water, Sound Transit would integrate efficient operating practices at existing and new facilities that require the use of energy- and water-saving equipment and related design strategies.

Sound Transit's commitment to sustainability practices includes minimizing GHG emissions, which could be achieved by conserving energy during construction. Such measures could include, but would not be limited to, conserving fuel through reductions in construction vehicle idling, setting minimum EPA-tier requirements for construction vehicles, and providing for pre-demolition extraction of salvageable, reusable, and recyclable materials. Sound Transit would confirm which sustainability measures are feasible during final design and work with the contractor to implement them during construction.

3.15.2.5 Indirect Impacts

No indirect impacts related to utilities, energy, and EMF would result from construction and operation of the proposed project.

3.15.3 Mitigation Measures

With planning and coordination with utility owners, none of the build alternatives would result in adverse impacts to utilities. There would be no impacts to energy resources or EMFs. As a result, no mitigation is anticipated.

3.16 Historic and Archaeological Resources

This section analyzes potential impacts associated with the OMF South project alternatives to built-environment resources and archaeological resources that are eligible for or listed in local, state, or national historic preservation registers. Historic-period, built-environment resources are buildings, structures, and objects that meet the minimum age criteria for consideration under a particular local, state, or national register. Archaeological resources are locations including objects that are in disuse and can be attributed to past human activities and that meet the minimum age criteria for consideration under particular local, state, or national guidelines and regulations. Collectively, historic-period, built-environment resources and archaeological resources that are listed in or eligible for the National Register of Historic Places (NRHP) are referred to as "historic properties."[5]

Within the area of potential effect (APE) for the OMF South alternatives, project archaeologists conducted archaeological assessment and inventory, including surface and subsurface survey. The APE defined by FTA for OMF South is the same as the area of impacts identified by Sound Transit for the 2021 SEPA Draft EIS. The surface and subsurface survey for the 2021 SEPA Draft EIS identified two additional archaeological sites and one additional archaeological isolate within the APE in addition to the two previously documented archaeological resources.

Project architectural historians also conducted built-environment survey and inventory. Resources that were constructed in 1985 or earlier were considered historic-period built environment resources for the purposes of this analysis and included in the built-environment survey and inventory, as they would be 40 years old by the construction start date of 2025 and meet the age criteria for listing in the King County Register of Historic Places (KCRHP), though not for the WHR or NRHP. For the 2021 SEPA Draft EIS, Sound Transit evaluated 86 historic-period built environment resources for NRHP eligibility and coordinated with staff from the Washington State Department of Archaeology and Historic Preservation (DAHP) to assess NRHP eligibility of the built environment resources. Through this coordination it was determined that none of the resources evaluated by Sound Transit were eligible for listing in the NRHP.

The only built resources within the APE previously determined eligible or listed in the NRHP were the Tacoma-Covington No. 2, 3, and 4 and Tacoma-Raver No. 1 transmission lines. Under a separate evaluation, BPA determined that the OMF South project would have no adverse effect to the transmission lines, a finding with which the State Historic Preservation Office (SHPO) has concurred.

For the 2021 SEPA Draft EIS, Sound Transit coordinated with DAHP and Tribes in a fashion similar to a Section 106 consultation. No comments were received from Tribes that were coordinated with under SEPA. Sound Transit and DAHP staff worked closely to establish NRHP eligibility of archaeological and built environment resources for the 2021 SEPA Draft EIS. Sound Transit distributed the OMF South Cultural Resources Survey and Testing Methodology plan for review by Tribes and DAHP on January 13, 2020. The 2021 SEPA Draft EIS was distributed to Tribes and DAHP on March 5, 2021, via email. This transmittal included leadership at Tribes as well as technical staff.

On July 20, 2023, FTA initiated Section 106 consultation and requested comments on the APE in letters to the Muckleshoot Indian Tribe, Nisqually Indian Tribe, Puyallup Tribe of the Puyallup

---

[5] Historic built-environment properties are differentiated from historic-period, built-environment resources, the former being eligible for the NRHP (and/or other historic registers) while the latter term is used to refer solely to those buildings, structures, and objects that meet minimum age criteria for historic register consideration.

Reservation, Snoqualmie Indian Tribe, Suquamish Indian Tribe of the Port Madison Reservation, Squaxin Island Tribe of the Squaxin Island Reservation, Confederated Tribes and Bands of the Yakama Nation, and SHPO. SHPO concurred with the APE on July 24, 2023. In October 2023, FTA determined, and SHPO concurred, that the project would have no adverse effect on resources listed on or eligible for the NRHP.

Appendix G4, Historic and Archaeological Resources Technical Report, contains additional information about state and local regulations affecting historic properties and describes in more detail the environmental and cultural context of the OMF South study area and the resources inventoried as part of the archaeological and historic-period, built-environment surveys.

3.16.1 Regulatory Context

The two main federal laws pertaining to archaeological and built-environment resources are the National Historic Preservation Act (NHPA; 54 U.S.C. § 300101 et seq.) and NEPA. Section 106 of the NHPA requires federal agencies to identify historic properties within the APE and to consider a project's potential effects on those historic properties. Implementing regulations for Section 106 compliance are found in 36 CFR § 800. The APE is defined as "the geographic area or areas within which an undertaking may directly or indirectly cause alterations in the character or use of historic properties" (36 CFR § 800.16(d)). Historic properties are defined as "any prehistoric or historic district, site, building, structure, or object included in, or eligible for inclusion in, the National Register of Historic Places maintained by the Secretary of the Interior" and can also include traditional cultural properties (36 CFR § 800.16(I)(1)). Under Section 106 of the NHPA, historic properties (those listed or eligible for listing in the NRHP) are identified and evaluated by the lead federal agency in consultation with Tribes with jurisdiction or interest, SHPO at the Washington State Department of Archaeology and Historic Preservation (DAHP), local jurisdictions, and other consulting parties, as appropriate. Archaeological and built-environment resources must also be given consideration under NEPA. In NEPA, "cultural resources" encompass a wide range of resources including, but not limited to, sacred sites, archaeological and built-environment resources not eligible for the NRHP, archaeological and built-environment resources eligible for the NRHP, and archaeological collections (CEQ and ACHP 2013:4). In addition, for U.S. Department of Transportation (including FTA) projects, Section 4(f) of the U.S. Department of Transportation Act includes protections for historic sites that are NRHP-eligible properties.

Applicable state laws and authorities include SEPA and regulations relating to archaeological and built-environment resources guiding the Washington Heritage Register (WHR) program administered by DAHP. Under state law, RCW 27.53, Archaeological Sites and Resources, any alteration to an archaeological site requires a permit from DAHP. State law, RCW 27.44 Indian Graves and Records, also protects Native American burial sites.

In addition to federal and state laws, ordinances and regulations are in place at county and municipal levels. King County has a designated Historic Preservation Program under the guidance of a landmarks commission. Kent and Federal Way have joined these programs and adopted appropriate ordinances and regulations for their jurisdictions. Each of these programs has individual guidelines and criteria that are discussed in Appendix G4, Historical and Archaeological Resources Technical Report.

3.16.2 Affected Environment

The APE includes all project elements and areas extending from the project elements (e.g., the OMF site and mainline, lead, and tail tracks) to the nearest parcel, or a maximum distance of 200 feet where large tax parcels are adjacent to project elements. The Preferred and South 344th Street alternatives include up to approximately 1.8 miles of new mainline tracks that would connect either of the sites to the Federal Way Link Extension terminus at the Federal Way Downtown Station. Figure 3.16-1 shows the APE for the three build alternatives. The depth of anticipated impacts has not been finalized but is expected to range from near-surface impacts to up to 180 feet below ground surface, depending on the alternative.

The study area used for the background and literature review was a 1-mile radius centered on each of the alignments included in the APE. A file search of the DAHP Washington Information System for Architectural and Archaeological Records Data (WISAARD) along with Government Land Office records and maps, ethnographic reports, historical maps, and aerial photographs were used to evaluate the archaeological sensitivity within the APE.

Fourteen previous cultural resource investigations have been undertaken within the 1-mile study area encompassing the Preferred Alternative, 15 previous investigations have been undertaken within the 1-mile study area encompassing the South 344th Street Alternative, and 14 previous investigations have been undertaken within the 1-mile study area of the Midway Landfill Alternative. No previously documented precontact archaeological sites or historic built-environment properties are known within the APE.

Two previously recorded historic-period archaeological sites are within the APE. Site 45KI719 was located within the potential construction limits of the South 344th Street Alternative but was determined not eligible for listing in the NRHP and subsequently removed by WSDOT during construction associated with I-5 improvements. Site 45KI1476 is the historic Midway Landfill, which has been determined not eligible for the NRHP by FTA, with SHPO concurrence (Chidley 2020).

Field Survey and Evaluation Methods

Prior to the commencement of the field surveys for the 2021 SEPA Draft EIS, a Cultural Resources Survey Plan was prepared for review by the Puyallup Tribe of Indians, Muckleshoot Indian Tribe, Nisqually Indian Tribe, the Confederated Tribes and Bands of the Yakama Nation, and SHPO. This plan was distributed to the aforementioned Tribes by Sound Transit under its authority as lead agency for SEPA. No formal comments were received from Tribes or SHPO.

The field survey included a historic-period, built-environment resources survey and inventory for previously undocumented or unevaluated buildings, structures, and objects constructed in 1985 or earlier, as well as an archaeological survey that included pedestrian transects and subsurface archaeological investigations (shovel probes and hand auger cores).

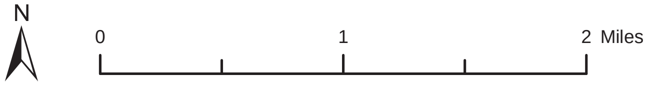

FIGURE 3.16-1
Area of Potential Effects
OMF South Alternatives

Historic-Period, Built-Environment Resources

The built-environment survey for the OMF South project inventoried resources built in or before 1985. The only built-environment resources built in 1985 or earlier that were excluded from survey were the BPA transmission system elements and resources with formal NRHP determinations of eligibility dating to within the last 10 years (per DAHP guidance). In 2020, BPA conducted its own Section 106 consultation with SHPO for the relocation of electrical transmission towers that would be impacted by the OMF South Project. These towers included those along the Tacoma-Covington Nos. 2, 3, and 4 and Tacoma-Raver No. 1 transmission lines. BPA determined, and SHPO concurred, that the transmission lines were eligible for listing in the NRHP (correspondence with SHPO is found in Appendix G4, Historic and Archaeological Resources Technical Report).

Built-Environment field survey took place between December 2019 and May 2020. Survey staff, who meet the Secretary of the Interior's qualifications for architectural history, collected photos and field notes sufficient to complete physical descriptions, integrity assessments, and evaluations of individual resources for listing in the NRHP, WHR, or KCRHP, as appropriate. All resources were surveyed from the public right-of-way unless otherwise noted.

Field research results combined with archival research provided the background for recommendations regarding whether or not each resource met criteria necessary for NRHP, WHR, or KCRHP eligibility.

Archaeological Resources

Archaeological survey occurred over several field sessions during 2020 and 2021. For the 2021 SEPA Draft EIS, pedestrian and subsurface investigations conducted in 2020 excluded areas of the Preferred and South 344th Street alternatives where they overlapped with the TDLE APE. Sound Transit, in cooperation with FTA, conducted a concurrent but separate analysis of the potential effects to historic and archaeological resources in the overlap areas as part of the TDLE environmental review process. Pedestrian and subsurface archaeological investigations were conducted for this analysis in 2021, and the results for the OMF South and TDLE overlap area are included in this Final EIS.

For both efforts, systematic surface and subsurface survey (shovel probe and auger cores) was conducted within the APE. Shovel probes were spaced at regular 20-meter intervals in areas of high archaeological probability, whereas 30 meters spacing was used in areas of low probability. All sediments in shovel and auger cores were screened through standard 0.25-inch mesh and pertinent information was collected for each shovel probe or auger core.

3.16.2.1 Survey Results

Historic-Period, Built-Environment Resources

Architectural historians surveyed and inventoried a total of 86 historic-period, built-environment resources in the APE, mapped in Figures 3.16-2 and 3.16-3. A total of 58 historic-period built-environment resources were old enough to meet minimum age criteria for NRHP eligibility consideration. Results for those resources old enough to qualify for the NRHP were documented in historic property inventory forms in DAHP's WISAARD database and can be found in Appendix G4, Historic and Archaeological Resources Technical Report. The remaining 28 surveyed resources were old enough to meet minimum age criteria for KCRHP eligibility consideration and were evaluated under King County criteria but were not recorded in WISAARD due to age restrictions, as per consultation with DAHP. Results of this analysis can be found in Appendix G4, Historic and Archaeological Resources Technical Report. In October 2023, FTA determined, and SHPO concurred, that none of the historic-period, built-environment resources surveyed for this project meet criteria necessary for NRHP eligibility, with the exception of the Tacoma-Covington Nos. 2, 3, and 4 and Tacoma-Raver No. 1 transmission lines (see Appendix G4, Historic and Archaeological Resources Technical Report, for the correspondence from SHPO).

Archaeological Resources

Table 3.16-1 lists the archaeological resources found within the APE of the OMF South build alternatives. A total of five archaeological resources are within the APE; one of the sites is near multiple alternatives, while others are close to only one alternative (Table 3.16-1).

Table 3.16-1 Summary of Archaeological Resources within the APE

Smithsonian Trinomial	Alternative	Resource Type	Resource Description	Resource Age	NRHP Eligibility and Criteria	Reference
45KI1542	Preferred	Historic period site	Historic period	ca 1930	Not Eligible	Huber 2020a
45KI1543[1]	Preferred, South 344th Street	Historic period site	Debris scatter	historic-period	Not Eligible	Huber 2020b
45KI1583	Preferred	Historic period isolate	Historic period bottle	1966	Not Eligible	Adams 2021
45KI719	South 344th Street	Historic period site	Historic period site	1936	Not Eligible	Lutrell 2005
45KI1476	Midway Landfill	Historic period site	Midway Landfill	1966–1983	Not Eligible	Chidley et al. 2020

Note:

(1) Site overlaps the Preferred and South 344th Street alternatives.

Site 45KI1542 is a concrete slab foundation dated to the 1930s using aerial imagery. The subsurface investigations around the foundation did not identify any additional archaeological deposits. Site 45KI1543 is a historic debris scatter, including brick and glass that appear to be in disturbed context. Isolate 45KI1583 is a historic period glass bottle identified on the surface. Site 45KI719 is a historic period foundation that is no longer present. During development of the 2021 SEPA Draft EIS Sound Transit has recommended, and SHPO has agreed, that none of the archaeological resources identified for this project meet criteria necessary for NRHP, WHR, or KCRHP eligibility (see Appendix G4, Historic and Archaeological Resources Technical Report for the correspondence from SHPO).

For more details on survey results, see Appendix G4, Historic and Archaeological Resources Technical Report.

OMF South

3.16.3 Environmental Impacts

This section discusses long-term operational and short-term construction impacts of the alternatives. These impacts are specifically focused on NRHP-eligible resources.

Section 106 regulations allow three findings for effects on cultural resources:

- No Historic Properties Affected
- No Adverse Effect
- Adverse Effect

As the lead agency, FTA makes the final determination of effect for each NRHP-eligible or listed resource in the APE. FTA also makes an overall finding of effect for the undertaking and requests SHPO's concurrence. The Section 106 process is used to determine a historic site's NRHP eligibility and whether it is a Section 4(f) resource. The Section 4(f) Assessment for OMF South is included in Appendix F of this Final EIS, and summarized in Section 3.18, Section 4(f) and 6(f) Resources.

Impacts or Effects

The terms impact and effect are used purposefully in this Environmental Impact Statement Section 3.16 and Appendix G4, Historic and Archaeological Resources Technical Report. The word "effect" is used when referring to the effects (e.g., adverse effect) the project has on historic properties in a Section 106 framework, following implementing regulations 36 CFR 800.

The word "impact" is used when referring to specific long-term or construction impacts, both direct or indirect, pursuant to NEPA implementing regulations 40 CFR 1502.

3.16.3.1 Impacts Evaluation Methods

After a cultural resource is identified and found NRHP-eligible, the next step is assessing whether the undertaking will adversely affect the resource by applying the Criteria for Adverse Effect (36 CFR § 800.5). An adverse effect is found when an undertaking may alter, directly or indirectly, any of the characteristics of a historic property that qualify the property for inclusion in the National Register in a manner that would diminish the integrity of the property's location, design, setting, materials, workmanship, feeling, or association. Adverse effects may include, for instance, the demolition of an NRHP-eligible building or physical encroachment upon an NRHP-eligible archaeological site (36 CFR Part 800).

Of the five archaeological resources within the APE (Table 3.16-1), none were determined eligible for listing in the NRHP. Because these resources have been determined not eligible for listing in the NRHP, the project would result in no adverse effects to archaeological historic properties.

Of the 86 built-environment resources surveyed and inventoried within the APE, none were determined eligible for listing in the NRHP or recommended eligible for the WHR or KCRHP. Therefore, the only NRHP-eligible resources within the APE are the Tacoma-Covington Nos. 2, 3, and 4 and Tacoma-Raver No. 1 transmission lines. In separate consultations, both BPA and FTA determined that proposed tower relocation and reconstruction for the Preferred and South 344th Street alternatives would not constitute an adverse effect under Section 106. In letters dated August 19, 2021, and October 31, 2023, SHPO concurred with this finding (See Appendix G4, Historic and Archaeological Resources, for copies of this correspondence). Therefore, the project would result in no adverse effect to historic built-environmental properties.

3.16.3.2 Long-Term Impacts

Potential impacts to archaeological resources include, but are not limited to:

- Demolition or alteration of the resource
- Physical encroachment upon a site

Direct long-term impacts can happen during operation or as a result of a construction activity that causes a permanent change. For archaeological resources, long-term impacts are generally initiated when ground-disturbing activities occur; they are characterized as long-term impacts because they permanently affect the archaeological record.

Ground-disturbing activities, specifically those involving excavation or ground clearance, could encounter an unanticipated archaeological site. If the site is determined to be eligible for listing in the NRHP, an adverse effect could occur.

Through the NEPA and the Section 106 process, FTA and Sound Transit will continue to consult with Tribes, SHPO, and other interested parties (as appropriate) to avoid, minimize, or mitigate impacts to archaeological sites, if found.

Potential impacts to historic built-environment resources include, but are not limited to:

- Demolition or alteration of the resource or altering major sections of its historically platted and current tax lot
- Physical changes to the character of the resource’s setting that contribute to its historic significance
- Introduction of visual or noise impacts that diminish the integrity of the property’s significant historic features

The only historic built-environment resources within the APE are BPA's Tacoma-Covington Nos. 2, 3, and 4 and Tacoma-Raver No. 1 transmission lines, which have been determined eligible for listing in the NRHP. In consultation with SHPO, BPA, and FTA determined that OMF South would have no adverse effect on the NRHP-eligible resources.

No-Build Alternative

Under the No Build Alternative, impacts to historic built-environment and archaeological resources from construction or operation of OMF South would not occur. However, other planned projects in the area could have impacts to historic and archaeological resources, depending on their location. This includes TDLE, which overlaps with the OMF South Preferred and South 344th Street alternatives. If TDLE is constructed as proposed, the mainline track associated with these OMF alternatives would be built later in time. Impacts associated with construction of the mainline track are addressed within the build alternatives impacts discussion below. All other TDLE-related impacts are addressed in Chapter 4, Cumulative Effects Analysis.

Preferred Alternative

Construction of the mainline tracks would require the relocation of BPA powerlines at the north end of the APE. BPA's Tacoma-Covington Nos. 2, 3, and 4 and Tacoma-Raver No. 1 transmission lines have been determined eligible for listing in the NRHP. In consultation with SHPO, FTA determined that the Preferred Alternative would have no adverse effects on the NRHP-eligible resources under Section 106. There are no other archaeological sites or historic-period, built-environment resources that meet criteria for listing in the NRHP, WHR, or KCRHP within the Preferred Alternative portion of the APE. As such, this alternative would have no adverse effects to historic or archaeological resources.

South 344th Street Alternative

Similar to the Preferred Alternative, construction of the mainline tracks would require relocation of BPA powerlines at the north end of the site. In consultation with SHPO, FTA determined that the 344th Street Alternative would have no adverse effects on the NRHP-eligible resources under Section 106. There are no other archaeological sites or historic-period, built-environment resources that meet criteria for listing in the NRHP, WHR, or KCRHP within the South 344th Street Alternative portion of the APE. As such, this alternative would have no adverse effects to historic or archaeological resources.

Midway Landfill Alternative

There are no archaeological sites or historic-period, built-environment resources that meet criteria for listing in the NRHP, WHR, or KCRHP within the Midway Landfill Alternative portion of the APE. As such, this alternative would have no effect to historic or archaeological resources.

3.16.3.3 Construction Impacts

Construction impacts are those that occur only during the construction period and are relatively short in duration. These may include effects such as noise, vibration, ground disturbance, and dust. It is unlikely that these kinds of effects will adversely affect archaeological resources. However, through the NEPA review and the Section 106 process, FTA and Sound Transit will continue to consult with Tribes, SHPO, and other interested parties (as appropriate) to minimize effects to archaeological sites, if found.

Construction-related impacts to built-environment resources can be caused by several factors, including, but not limited to, restricted access, increased truck traffic along haul routes, glare, noise, vibration, and temporary changes to setting. These factors can lead to reduced commercial activity and reduced investment in historic resources. Typically, these impacts would not be considered adverse effects under Section 106 of the National Historic Preservation Act unless they diminish the characteristics that contribute to a historic property’s National Register eligibility.

The only historic built-environment resources within the APE are BPA's Tacoma-Covington Nos. 2, 3, and 4 and Tacoma-Raver No. 1 transmission lines, which have been determined eligible for listing in the NRHP. In consultation with SHPO, FTA determined that OMF South would have no adverse effect on the eligible resources.

Preferred Alternative

Because no previously documented or newly discovered eligible archaeological sites have been identified within the APE and because it is within an area of low probability for precontact archaeological sites, the project is not likely to impact archaeological resources.

The only historic built-environment resources within the APE are BPA's Tacoma-Covington Nos. 2, 3, and 4 and Tacoma-Raver No. 1 transmission lines, which have been determined eligible for listing in the NRHP. In consultation with SHPO, FTA determined that the Preferred Alternative would have no adverse effects on the eligible resources.

South 344th Street Alternative

Because no previously documented or newly discovered eligible archaeological sites have been identified within the APE and because it is within an area of low probability for precontact archaeological sites, the project is not likely to impact archaeological resources.

The only historic built-environment resources within the APE are BPA's Tacoma-Covington Nos. 2, 3, and 4 and Tacoma-Raver No. 1 transmission lines, which have been determined eligible for listing in the NRHP. In consultation with SHPO, FTA determined the South 344th Street Alternative would have no adverse effects on the eligible resources.

Midway Landfill Alternative

Because no previously documented or newly discovered eligible archaeological sites have been identified within the APE and because it is within an area of low probability for precontact archaeological sites, the project is not likely to impact archaeological resources. No historic built-environment resources are within the Midway Landfill Alternative portion of the APE.

3.16.3.4 Avoidance and Minimization of Impacts

An Inadvertent Discovery Plan has been developed for the project and would be implemented during construction. The purpose of the Inadvertent Discovery Plan is to minimize the risk of damage to currently unknown archaeological resources by providing appropriate procedures for addressing any inadvertent discoveries of human remains or archaeological resources during ground-disturbing work. Sound Transit would coordinate with SHPO and Tribes to review the plan prior to implementation. A contractor orientation would also be prepared to familiarize construction crews with Inadvertent Discovery Plan procedures and the kinds of resources that may be encountered during construction.

3.16.3.5 Indirect Impacts

No indirect impacts related to historic and archaeological resources would result from construction and operation of the proposed project.

3.16.4 Mitigation Measures

As the project would not result in adverse effects to historic built-environment properties, no mitigation is anticipated. No eligible archaeological sites have been identified. No mitigation measures are anticipated beyond the Inadvertent Discovery Plan to address potential discoveries during construction.

3.17 Parks and Recreational Resources

This section evaluates impacts to parks and recreational resources associated with the OMF South build alternatives, including impacts to the use or enjoyment of existing and planned recreational resources, including potential impacts to resource access, facilities, functions, or character. Parks and recreational resources include the following facilities and land uses:

- Federal, state, and local parks, playgrounds, recreation centers, and other public recreation facilities, such as golf courses and pools
- Designated public open spaces, greenbelts, and open space corridors
- Recreational trails
- Potential recreational properties funded by state and/or federal grants with special provisions

The study area for parks and recreational resources includes facilities and land within 0.25 mile of the potential construction limits for each of the OMF sites. The study areas for the Preferred and South 344th Street alternatives include the mainline tracks and are combined for the purposes of this analysis because of their geographic overlap.

3.17.1 Affected Environment

3.17.1.1 Preferred and South 344th Street Alternatives

Table 3.17-1 describes parks in the combined study area for the Preferred and South 344th Street alternatives, which are shown in Figure 3.17-1.

Table 3.17-1 Parks and Recreational Resources: Preferred and South 344th Street Alternatives

Park Name	Jurisdiction	Description
Cedar Grove Park	Federal Way	Park (2.6 acres) with open lawn picnic areas, a play area, and walking trails bordered by natural areas. Also known on King County maps as Thompson Park.
Town Square Park	Federal Way	Urban community park (3.9 acres) with amenities, including zip lines, a children's play area, a basketball court, parking, a picnic area, restrooms, and a seasonal splash park.
Pacific Rim Bonsai Museum and Rhododendron Botanical Gardens	Federal Way	Both of these visitor attractions are nonprofit membership organizations on the grounds of the Woodbridge Corporate Park (former Weyerhaeuser corporate headquarters site). Both facilities feature public plant collection garden displays with walking tours and events. The Bonsai garden offers free admission, and the Rhododendron Garden charges entry fees or is free with membership.

Sources: King County; City of Federal Way.

Although outside the study area, the 3.8-mile BPA Trail connects many key parts of Federal Way. There is potential for future expansion of the trail into the combined study area of these alternatives.

Belmor includes a private, par-3, nine-hole golf course for residents only.

3.17.1.2 Midway Landfill Alternative

Table 3.17-2 describes parks within the Midway Landfill Alternative study area, which are shown in Figure 3.17-2.

Table 3.17-2 Parks and Recreational Resources: Midway Landfill Alternative

Park Name	Jurisdiction	Description
Parkside Park	Des Moines	Neighborhood park (4.4 acres) with an ADA-accessible paved trail system to all portions of the park, a multiuse paved sport court, fitness equipment, picnic tables, and benches. Mature trees frame the central open lawn and active recreation areas.
Parkside Wetlands	Des Moines	Park (14 acres) with natural areas and trails that are covered with a dense mix of deciduous and coniferous forest and wetlands.
Salt Air Vista Park	Kent	Neighborhood park (2 acres) bordered by the Parkside wetlands on the west. It features play equipment, picnic area, open space, and trails.
Linda Heights Park	Kent	Park (4.2 acres) with half-court basketball, picnic table, play equipment, and public art. The park is adjacent and east of I-5 and is buffered from the freeway by a wide stand of mature mixed forest.
West Hills Park	Kent	Undeveloped park (13 acres) with no facilities. It is adjacent to the Kent Armory and is composed of a grassy field and dense vegetation near the headwaters of Midway Creek.

Sources: King County; Cities of Des Moines and Kent.

3.17.2 Environmental Impacts

3.17.2.1 No-Build Alternative

Under the No-Build Alternative, impacts to parks and recreational resources from construction or operation of OMF South would not occur. However, other planned projects could have impacts in the OMF South study areas, depending on their location. This includes TDLE, which overlaps with the OMF South Preferred and South 344th Street alternatives. If TDLE is constructed as proposed, the mainline track associated with these OMF alternatives would be built later in time. Impacts associated with construction of the mainline track are addressed within the build alternatives impacts discussion below. All other TDLE-related impacts are addressed in Chapter 4, Cumulative Effects Analysis.

3.17.2.2 Long-Term Impacts

Impacts Common to All Build Alternatives

Long-term impacts include permanent changes to a resource, such as when a project converts land from a park or recreational resource to another use. While long-term impacts generally refer to permanent changes, some construction impacts can be considered long term if they would have a major effect on the resource and extend for many years. Long-term impacts also potentially include noise, visual, or other impacts from project operations.

None of the build alternatives would cause long-term impacts to parks or recreation facilities within the study area, either by altering those properties or through noise or visual impacts to those facilities.

3.17.2.3 Construction Impacts

Impacts Common to All Build Alternatives

The project alternatives are not expected to have direct construction impacts on any park or other recreational resources. For parks and trails near construction activities, access could be affected by detours and street or lane closures and by increased congestion caused by construction traffic. Visual impacts, light, glare, dust, and noise could also affect users in some of the parks and trails, although most of these impacts would affect only small portions of the parks closest to the OMF site or mainline tracks being constructed. Visual and noise impacts during construction from on-site construction or from construction traffic along haul routes would be temporary and would not inhibit park use. It is possible some parks in the study area would experience emissions and airborne dust during construction; however, with implementation of controls required for construction activities and consistent use of BMPs to minimize on-site emissions, construction activities would not be expected to substantially affect air quality.

Preferred Alternative

Construction of the mainline tracks would require some utility relocations on S 333rd Street in Federal Way, which is the street used to access Cedar Grove Park. During that work, access to Cedar Grove Park from the east may be affected by a detour or lane closure, but access from the west on S 333rd Street and north from 22nd Place S would be maintained.

South 344th Street Alternative

Impacts for the South 344th Street Alternative would be the same as those described above for the Preferred Alternative.

Midway Landfill Alternative

Parks near the Midway Landfill Alternative are separated from the site either by SR 99 on the west or I-5 on the east. Park users are accustomed to noise, vibration, and visual effects from normal operation of these major roadways, which would likely lead to a reduced level of awareness of potential construction impacts at the parks.

3.17.2.4 Avoidance and Minimization of Impacts

Measures to minimize construction impacts would include public outreach to provide information on temporary closures or detours, on-site signage describing the duration and type of temporary impacts, detour signage, temporary ADA improvements (for example, temporary curb ramps for detour routes that do not currently include curb ramps for existing sidewalks), and similar strategies to ensure the continued use and enjoyment of affected park facilities.

BMPs, avoidance and minimization of impacts measures, or mitigation measures identified in this Final EIS for other resources (visual and aesthetics, air quality, water quality, neighborhoods, noise and vibration, and transportation) would also reduce the potential effects on affected parks and recreational resources and their users.

3.17.2.5 Indirect Impacts

No indirect impacts related to parks and recreational resources would result from construction and operation of the proposed project.

3.17.3 Mitigation Measures

No adverse impacts to parks or recreation facilities would occur; therefore, no mitigation is anticipated.

3.18 Section 4(f) and 6(f) Resources

This section summarizes the Section 4(f) analysis completed in compliance with Section 4(f) of the United States Department of Transportation Act of 1966 (49 U.S.C. § 303(c)). The full Section 4(f) analysis can be found in Appendix F, Section 4(f) and Section 6(f) Assessment.

The regulations at 23 CFR § 774 implement 23 U.S.C. § 138 and 49 U.S.C. § 303, which were originally enacted as Section 4(f) of the Department of Transportation Act of 1966 and are still commonly referred to as Section 4(f). Under these laws, FTA and FHWA are generally prohibited from approving projects that would result in a *use* of publicly-owned parks and recreation areas that are open to the public; publicly-owned wildlife and waterfowl refuges; and historic sites of national, state, or local significance.

In addition, Section 6(f) of the 1965 Land and Water Conservation Fund Act of 1965 (54 U.S.C. § 2003), prohibits the conversion of properties developed with funding from the Land and Water Conservation Fund to a nonrecreational purpose without approval of the U.S. Department of the Interior's National Park Service. Washington State law similarly requires documentation and consultation to approve any changes to or conversion of properties directly funded by the Washington State Recreation and Conservation Office (RCO; Title 79A RCW).

The study area for this analysis is the same used for Section 3.17, Parks and Recreational Resources, and includes the APE used in Section 3.16, Historic and Archaeological Resources. The Parks and Recreational Resources study area includes existing parks, trails, recreation sites, dedicated open space areas, and adjacent public rights-of-way used for access to these facilities within 0.25 mile of each OMF South site. The APE extends from the project elements to the nearest tax parcel, or a maximum of 200 feet where large tax parcels are adjacent to project elements.

Under Section 4(f), a use can be permanent, temporary, or constructive. **Permanent use** would acquire or incorporate all or part of a Section 4(f) property as part of the transportation facility. **Temporary use** occurs when the project temporarily occupies and substantially impairs the resource (typically during construction). **Constructive use** can occur when the project is near a Section 4(f) resource and has effects that substantially impair the protected activities, features, or attributes of the property.

Although the use of Section 4(f) property is generally prohibited, a transportation use of a Section 4(f) property can be approved if the use of the property meets the requirements for a regulatory exemption, the use will have a *de minimis* impact on the property (meaning that it does not adversely affect the activities, features, and attributes of a resource), or there is no feasible and prudent avoidance alternative to using the property.

3.18.1 Affected Environment

3.18.1.1 Public Parks and Recreation Areas

Sound Transit identified two parks within the study area for the Preferred and the South 344th Street alternatives that qualify as Section 4(f) properties: Cedar Grove Park and Town Square Park. Sound Transit identified four developed parks and one open space that qualify as Section 4(f) properties in the study area for the Midway Landfill Alternative: Parkside Park and Parkside Wetlands in Des Moines and Salt Air Vista Park, Linda Heights Park, and West Hill Park in Kent. These resources are described in detail in both Section 3.17, Parks and Recreational Resources and Appendix F, Section 4(f) and Section 6(f) Evaluation.

There are no designated 6(f) resources within the study area for any of the alternatives. However, Linda Heights Park in Kent is an RCO-funded park.

3.18.1.2 Wildlife and Waterfowl Refuges

No designated wildlife and waterfowl refuges of national, state, or local significance exist in the Parks and Recreation study areas for any of the alternatives.

3.18.1.3 Historic Sites

Section 3.16, Historic and Archaeological Resources and Appendix G4, Historic and Archaeological Resources Report provide information on historic properties in the OMF South build alternatives APE. The Tacoma-Covington Nos. 2,3,4 and Tacoma-Raver No. 1 electrical transmission lines were determined eligible for listing in the NRHP by both FTA and BPA, a finding with which SHPO has concurred. No other historic-period, built-environment resources were determined to be present within the APE.

3.18.2 Environmental Impacts

The Transportation; Acquisitions, Displacements and Relocations; Visual and Aesthetic Resources; Noise and Vibration; Historic and Archaeological Resources; and Parks and Recreational Resources sections of the Final EIS were considered to determine whether project alternatives would result in a Section 4(f) use. None of the alternatives would require any land from any of the park properties for either construction or operation of OMF South, and no construction activities or operational activities of the project would rise to the level of a permanent, temporary, or constructive use under Section 4(f).

Cedar Grove Park within the Preferred and South 344th Street alternative study area would be within the closest proximity to construction activities, at approximately 300 feet from mainline construction, just beyond the range of noise impacts from pile driving activities, which may be necessary for construction of the elevated mainline. While construction noise and activities would be perceptible from the park, the impacts would be temporary and transitory in nature, and would not prevent use of the amenities that make the park an eligible 4(f) resource. The other parks listed above would be outside the range of impacts or separated from the OMF sites by SR-99 and I-5, which would provide effective buffers from construction activities.

Construction of the mainline for the Preferred and South 344th Street alternatives would require the relocation of BPA powerlines. In separate consultations, BPA and FTA determined, and SHPO concurred, that raising the transmission lines to accommodate the OMF South project would have no adverse effect on historic properties under Section 106. Due to this, FTA has determined that the project would have a *de minimis* impact under Section 4(f).

Please see Appendix F, Section 4(f) and Section 6(f) Evaluation for more detail.

3.18.3 Mitigation Measures

As the Preferred and South 344th Street alternatives would have *de minimis* impacts to Section 4(f) properties and the Midway Landfill Alternative would have no impacts, no mitigation measures are anticipated.

4 CUMULATIVE EFFECTS ANALYSIS

This chapter considers the cumulative effects of OMF South and other past, present, and reasonably foreseeable future actions, regardless of what agency or party undertakes such other actions. A cumulative effects assessment can reveal unintended consequences that might not be apparent when a proposed action is evaluated in isolation. (Note: while NEPA uses the term “effects,” SEPA uses “impacts.” For the purposes of this discussion, the words have the same meaning.)

Cumulative effects are defined as “the effects on the environment that result from the incremental effects of the action when added to the effects of other past, present, and reasonably foreseeable actions regardless of what agency (Federal or non-Federal) or person undertakes such other actions. Cumulative effects can result from individually minor but collectively significant actions taking place over a period of time” (40 Code of Federal Regulations 1508.1(g)(3)). Public agencies must analyze cumulative impacts to fully understand how a proposed action and its alternatives interact with past actions, present-day activities, and actions that are planned and reasonably certain to occur in the future. Studying the proposed project in conjunction with other actions can reveal unintended impacts that may not be clear when the proposed project is analyzed by itself.

Sound Transit has considered its planned projects and gathered information from agencies and the public to identify impacts of past and present developments and reasonably foreseeable future actions that could interact with the impacts of OMF South alternatives, including:

- Adopted transportation plans, land use plans, and neighborhood plans from King County, Federal Way, and Kent.
- Lists of known major public and private land use proposals in King County, Federal Way, and Kent.
- Information provided by WSDOT and King County Metro on planned transportation projects and developments.
- PSRC data on population and employment growth projections, travel forecasts, and land use projections.
- Information provided by other organizations and the public on planned private projects, community values, and concerns.

This information was used to identify past and ongoing development trends, characterize reasonably foreseeable future actions, and identify and evaluate expected cumulative impacts to which OMF South could contribute.

4.1 Temporal and Geographic Boundaries of the Cumulative Effects Analysis

Consistent with regulatory guidance for cumulative impact analyses, the development actions that were considered included those that are past, present, and reasonably foreseeable.

- Past actions include non-native settlements dating back to the 1800s through developments up to the present.
- Present actions are those projects just completed or under construction by local, state, or federal agencies.

- Reasonably foreseeable future actions are those that have obtained some local, state, or federal government approval and thus could be under construction at any time between the present and 2042 (OMF South's design year).

The study area for this cumulative impact analysis is generally a combination of the study areas defined in Chapter 3 for the various environmental resources and construction impacts or a broader area for certain elements of the environment, as described below:

- Avian species and other migratory animals or animals with large foraging areas are studied at the wildlife corridor level.
- Fish habitats are considered at the watershed level for impacts on stream quality.
- Transportation, air quality, energy, and, to some degree, economics are studied at the Puget Sound regional level, including Pierce, King, Snohomish, and Kitsap counties.
- GHGs are studied at the Puget Sound regional level, while it is acknowledged that the effects are felt globally.
- Socioeconomic resources that may experience a range of cumulative impacts from new infrastructure projects, such as land use, economics, neighborhoods, public services, visual resources, and parks, were generally analyzed within 0.25 to 1 mile of the project alternatives.

4.2 Past and Present Actions

Ongoing impacts from past actions have shaped the project vicinity since the mid-19th century. The area between Seattle and Tacoma has become increasingly urban, with suburban population growth spreading to surrounding areas, including Federal Way and Kent in the OMF South study areas. Development that has occurred next to I-5 and SR 99 has been predominantly commercial and residential, with some industrial, office, mixed-use, and agricultural uses as well.

Past and present regional and local planning efforts have emphasized an integrated, long-range growth-management, economic, and transportation strategy based on a vision of high-density, urbanized centers linked by a high-quality, multimodal transportation system that includes light rail. The environmental effects of past and ongoing actions are considered in relation to the natural and built environments.

4.2.1 Natural Environment

Much of the OMF South study area is now urbanized but originally contained forest land, wetland, streams, and riparian environments. The topography was substantially modified through urban development as well as through the construction of I-5 and SR 99, where hills were cut or regraded and valleys and lowlands filled to create the highways.

Urbanization has resulted in hydrologic changes, such as decreased baseflow and aquifer recharge during summer months and increased seasonal flow fluctuations and flooding during periods of heavy rain, as compared with predevelopment conditions. The development has also affected water quality by introducing runoff contamination from pollution-generating surfaces and by increasing water temperatures due to the removal of vegetation that previously provided shade along stream banks.

Past actions affecting the natural environment included timber harvesting, natural resource extraction, farming, ranching, and residential development. The wetlands present in the OMF South study area represent fragments of larger historical wetland systems, and some are more recently formed wetlands that have developed because of transportation, land use, and surface water drainage improvements that have altered the landscape. The Hylebos Creek basin contains the largest wetlands in the study area.

Due to the heavily developed nature of the OMF South study area, most of the vegetation present reflects landscaping practices for urban and suburban areas, with remnant tree canopy retained for shade or aesthetics. However, mature forest is within the study area along the riparian corridor of the Hylebos Creek tributaries to the west of I-5.

4.2.2 Built Environment

In the six decades since the completion of I-5 in Washington, industrial and commercial development has grown steadily in the study area. Employment encompasses a variety of industries and business sectors, including retail, food service, and light industrial. The land uses adjacent to the SR 99 and I-5 corridors are primarily commercial and residential, with some industrial, office, mixed-use, and limited amounts of open space.

4.3 Reasonably Foreseeable Future Actions

Reasonably foreseeable future actions are future projects that would produce environmental impacts that could add to or interact with the impacts associated with OMF South alternatives and other past and present actions. Reasonably foreseeable future actions are not speculative and are considered regardless of the agency, organization, or person serving as their proponent (CEQ 1997). They must be likely to occur in the reasonably foreseeable future by virtue of being funded, approved, or under consideration for regulatory permitting; being the subject of an environmental review process under NEPA or SEPA; or being part of an officially adopted planning document or publicly available development plan.

Changes to transportation infrastructure are one of the biggest influences on transportation conditions and other environmental topics, such as noise and air quality. Past, present, and reasonably foreseeable future actions are listed in Table 4.3-1 and shown on Figures 4.3-1 and 4.3-2.

Table 4.3-1 Past, Present, and Reasonably Foreseeable Future Actions

Map ID	Proponent	Actions and Projects in the Vicinity	Project Description	Planned Completion Date
1	WSDOT	SR 509 Completion Project (Part of the Puget Sound Gateway Program)	A new four-lane expressway between S 188th Street and I-5/ S 272nd Street and SR 509, also includes new I-5 ramps, improvements to I-5 interchanges in south King County and constructs new bridges. (WSDOT 2023a). These improvements are part of the Puget Sound Gateway Program, which combines this project with the SR 167 Completion Project in Pierce County to complete critical missing links in the state's highway and freight network.	2029
2	Sound Transit	Federal Way Link Extension (FWLE)	Extends Sound Transit's Link Light Rail from the Angle Lake Station in Sea-Tac south to the Federal Way Downtown Station. This includes three stations in Kent/Des Moines near Highline College, S 272nd Street, and the Federal Way Downtown Station. A total of 3,200 parking spaces will be added along the route. (Sound Transit 2023a)	2026

Table 4.3-1 Past, Present, and Reasonably Foreseeable Future Actions (continued)

Map ID	Proponent	Actions and Projects in the Vicinity	Project Description	Planned Completion Date
3	Private	Pape – Kenworth Development	Two buildings that will include areas for truck maintenance, showroom, office, and warehouse space (City of Federal Way 2020a).	TBD
4	Sound Transit	Tacoma Dome Link Extension (TDLE)	Extends Sound Transit's Link light rail from the Federal Way Downtown Station to the Tacoma Dome Transit Station. Will also include new light rail stations in South Federal Way, Fife, and additional Tacoma locations. (Sound Transit 2023b)	2035
5	Federal Way	Federal Way City Center Access Project	Intended to ease congestion in Federal Way's City Center through a number of projects which will improve access to I-5 and local street projects. This will include but not be limited to road widening and additional roundabouts, HOV lanes, and overcrossings in the City Center area. (City of Federal Way 2022)	Construction currently unfunded.
6	Private	FUSION Family Center Project	An Econo Lodge hotel in the Federal Way area was converted to a 29-room emergency shelter for families experiencing homelessness. (FUSION Federal Way 2023)	Completed December 2020
7	Private	Creekside Commons Townhomes	Approximately 10 acres will be converted to 94 townhome units. (City of Federal Way 2019a)	TBD
8	Private	Woodbridge Corporate Park (Weyerhaeuser Campus) Redevelopment	The former Weyerhaeuser Campus will be restored to a fully operational corporate park, with a focus on learning, workforce training, and economic development. Historic and natural features will be preserved during restoration. Once complete, an estimated 3,100 jobs will be created.(Industrial Realty Group 2022; Nieto 2022)	2025
9	Federal Way	Asphalt Overlay Project – S 336th Street – 10th Place S to 18th Avenue S	Various streets in Federal Way are being repaved within the 2022 Asphalt Overlay Project, including S 336th Street – 10th Place S to 18th Avenue S. Sidewalks will be improved to meet ADA requirements. (City of Federal Way 2021)	2023
10	Federal Way	Widen S 336th Street between SR 99 (Pacific Highway S) and 20th Avenue S	S 336th Street will be widened to five lanes, and second left-turn lanes will be added for eastbound and westbound SR 99. In addition, sidewalks will be added on the north side of S 336th Street. (City of Federal Way 2023)	TBD
11	Federal Way	Asphalt Overlay Project – 16th Avenue S – SR 99 to SR 18	Various streets in Federal Way are being repaved within the 2022 Asphalt Overlay Project, including 16th Avenue S – SR 99 to SR 18. In addition to repaving these streets, sidewalks will be improved in accordance with the ADA, including improvements to wheelchair ramps. (City of Federal Way 2021)	TBD
12	Federal Way	16th Avenue S: S 344th Street – S 348th Street Auxiliary Lane	A third southbound through-lane will be added at the intersection of S 348th Street and 16th Avenue S. (City of Federal Way 2020b)	2026
13	WSDOT	SR 161 – Milton Road S Vicinity to SR 18 – Paving and ADA Compliance	SR 161 was resurfaced in both directions, and ADA ramps were replaced. (WSDOT 2022)	Completed 2022
14	Federal Way	SR 99 HOV Lane Widening, S 340th Street to S 359th Street	SR 99 was widened from a five-lane section to a six-lane section, with two general-purpose lanes, and one HOV lane added in each direction. A landscaped median was added, with left-turn lanes and U-turn accessibility at intersections. (City of Federal Way 2019b)	Completed 2018
15	WSDOT	I-5/SR 16/SR 18 Triangle Interchange Vicinity Improvements	A new southbound exit will be added to S 356th Street, the existing exit for SR 18 will be replaced, and the intersection at SR 161 will be realigned with Milton Road South/20th Avenue South. (WSDOT 2023b)	Project suspended in 2023; no resumption date scheduled.

FIGURE 4.3-2
Past, Present, and Reasonably Forseeable Future Actions
OMF South

The four reasonably foreseeable future projects that would have the greatest potential for cumulative impacts with OMF South are Sound Transit's TDLE, WSDOT's SR 509 Completion Project and I-5/SR 16/SR 18 Triangle Interchange Vicinity Improvements, and the Federal Way City Center Access Project.

TDLE would extend light rail service nearly 10 miles via mostly elevated tracks between Federal Way and Tacoma. The project includes four new light rail stations in areas near south Federal Way, Fife, Portland Avenue, and the Tacoma Dome. The stations would provide connections to other transit services in the region, such as Sounder, Tacoma Link, Sound Transit Express, King County Metro, Pierce Transit, Intercity Transit, and Amtrak. Additional information is available at Sound Transit's web page focused on system expansion: https://www.soundtransit.org/system-expansion.

As described in Section 2.4, Project Alternatives, TDLE would be constructed and open after OMF South. Impacts associated with constructing the mainline tracks connecting the FWLE terminus to the OMF South for the Preferred or South 344th Street alternatives are addressed in the discussion of the build alternatives in Chapter 3 of this Final EIS. TDLE impacts beyond those associated with the mainline tracks are addressed in this cumulative impacts analysis chapter and will be further detailed in the separate TDLE Draft EIS, expected to be published in mid-2024. If the Midway Landfill Alternative were selected to be built, impacts associated with the mainline tracks of the Preferred and South 344th Street alternative could still occur, but later in time as part of the proposed TDLE construction and operations.

Federal Way's City Center Access Project is intended to ease traffic congestion caused by sustained growth. In November 2019, the Federal Way City Council approved moving forward on designing a modified interchange with an overcrossing at S 324th Street and extended I-5 access ramps serving S 320th Street and S 324th Street. The City Center Access Project overlaps with the northern portion of the mainline for the OMF South Preferred and South 344th Street alternatives near S 324th Street. The project is currently in preliminary design and is undergoing environmental review under NEPA; however, the project is not currently fully funded and construction dates are not known.

WSDOT's SR 509 Completion Project is part of the Puget Sound Gateway Program, which also includes the SR 167 Completion Project in Pierce County. Together, these projects help complete critical freight corridors in the Puget Sound region. The SR 509 Completion Project will build a new four-lane expressway between I-5 and SR 509's current terminus near SeaTac Airport. The project will also build new freeway ramps, improves existing freeway interchanges, and builds new bridges. Construction began in 2020 and is expected to be completed in 2028.

WSDOT's Triangle Interchange Vicinity Improvements would add a new southbound exit to South 356th Street, rebuild the existing exit to SR 18, and realign the SR 161 intersection with Milton Road South/20th Avenue S. The project was suspended in 2023, with no date for resumption scheduled.

4.4 Analysis of Cumulative Effects

Adverse and/or beneficial cumulative impacts could occur over an extended period during project operation, when impacts of OMF South would add to or interact with long-term impacts of other past actions, present actions, and reasonably foreseeable future actions. Adverse cumulative impacts could occur over the short-term during construction when activities necessary to build OMF South would accumulate with impacts from other projects under construction at the same time. The following sections discuss expected cumulative impacts of project construction and operations on elements of the environment. The direct and indirect long-term and construction impacts of the project that could contribute to future cumulative impacts are discussed in Chapter 3.

Operation of OMF South would facilitate operation of regional light rail and contribute to a shift of some vehicle trips to light rail transit, thereby reducing demand on traffic and bus transit movement (Sound Transit 2016a). This in turn would contribute to a reduction in impacts on air quality, noise levels, water quality, and energy consumption compared with future conditions projected under the No-Build Alternative, as described in the corresponding sections below. Therefore, a contribution of OMF South would be to reduce the adverse cumulative impacts on these resources to levels below what they would be without the project.

4.4.1 Transportation

The transportation access analysis presented in Section 3.2 reflects conditions with assumed growth between existing conditions and the design year (2042). The traffic growth assumptions also reflect changes in traffic volumes that are projected in the traffic forecasts prepared for FWLE and TDLE. As a result, the traffic analyses reflect the cumulative impacts of these Link light rail extensions as well as other planned and foreseen developments and associated increases in traffic within the study areas.

FWLE is under construction and is forecasted to begin service in 2026. Design and construction for OMF South is planned from 2024 to 2037, depending on the alternative. Should OMF South be located at the Midway Landfill Alternative, the FWLE construction period may overlap the planned construction period for OMF South; however, this is unlikely as the section of FWLE adjacent to the landfill should be completed before OMF South construction is scheduled to begin. There is also the potential that the construction period for OMF South would overlap with TDLE, if the Midway Landfill Alternative is selected to be built.

Federal Way’s City Center Access project would construct a new I-5 interchange at S 324th Street and improvements to the existing I-5/S 320th Street interchange. Project design continues with a planned construction start as soon as 2027. However, construction is currently unfunded. In conjunction with the City Center Access project, WSDOT is proposing to make fish passage improvements that would remove a portion of parking spaces in the Federal Way/S 320th Street Park & Ride. This work could overlap with OMF South construction. This potential impact to parking availability may be in addition to the 50 parking spaces that would be removed as part of the OMF South Preferred and South 344th Street alternatives. Because the project does not have construction funding and has not yet completed environmental review, the change in traffic patterns due to the City Center Access project were not reflected in the 2042 traffic analyses for OMF South.

In addition to the parking spaces removed by OMF South, further loss of parking spaces at The Commons at Federal Way shopping mall (from FWLE) and Walmart (from TDLE) are not expected to affect access to those properties due to the amount of remaining parking within and adjacent to those properties. Any future development in those areas would need to comply with Federal Way parking requirements.

4.4.2 Acquisitions, Displacements, and Relocations

Several other public projects planned in the vicinity of the OMF South alternatives could acquire property, most notably TDLE would acquire properties to the south of the Preferred or South 344th Street alternatives. In addition, there could also be other smaller public or private projects in the project vicinity that would acquire new properties and displace existing uses.

As part of the City Center Access project in Federal Way, transportation improvements and stream culvert work would displace Belmor residents in the vicinity of the OMF South mainline tracks for the Preferred and South 344th Street alternatives. Some of these mobile home displacements may overlap with OMF South displacements, or there may be additional displacements. Because the City Center Access project does not currently have construction funding, it is likely that OMF South would begin the acquisition and relocation process before Federal Way begins project construction. Therefore, the two projects would not have overlapping construction impacts, but may have adverse long-term cumulative impacts within Belmor, depending on the OMF South mainline track option and the final design for the City Center Access project.

There are no anticipated projects from other public agencies or private development that are anticipated to contribute to adverse impacts within the Midway Landfill Alternative study area.

4.4.3 Land Use

OMF South, in conjunction with other land use actions by local governments and other property owners, could result in cumulative impacts to land uses in the vicinity of the project alternatives. The cumulative impacts of these land use actions are contemplated in the analysis in Section 3.4, Land Use, as it includes a review of anticipated changes based on local and regional plans to accommodate future population and employment growth forecasts.

The purpose of OMF South is to support the expansion of the Link light rail system under Sound Transit 3. Cumulatively, the Sound Transit light rail projects and planned development projects could help achieve goals that encourage and support high-density, mixed-use, transit-oriented development. Although there are reasonably foreseeable future land developments in the study area that would increase density without light rail, the Sound Transit 3 projects supported by OMF South, such as TDLE, would support a greater density of development than would likely occur without light rail, particularly near planned light rail stations in Federal Way. Land use changes are expected to be greatest near stations due to increased transit accessibility and pedestrian activities, which are generally attractive to businesses and residents. Any necessary changes to development regulations to allow higher density and more intense land use would be within the discretion of local governments.

All three build alternatives would displace commercial or light industrial uses to different degrees, which could add to the demand for commercial or industrial land in the region as displaced businesses would have to relocate to other areas that could accommodate their use. However, this concern would be addressed through periodic updates to regional and local comprehensive plans, which include regionally coordinated land capacity analyses. Through these updates, cities and counties must adopt future land use maps to ensure they have the land capacity available to accommodate future population and employment growth.

There are several reasonably foreseeable projects occurring within or near the study area of the Preferred and South 344th Street alternatives, including FWLE, TDLE, Federal Way's City Center Access Project, and WSDOT's SR 509 Completion Project, all of which would convert existing land uses to transportation land uses (Sound Transit 2016b; WSDOT 2003; FHWA/WSDOT 2018). The cumulative land use impacts of these projects would be to reduce traffic congestion and support the expansion of the light rail and high-capacity transit system consistent with the Washington State's Growth Management Act, PSRC's Vision 2050, and local comprehensive plans.

There are no current or future development projects within 0.5 mile of the Midway Landfill Alternative that are anticipated to affect adjacent land uses aside from FWLE.

4.4.4 Economics

The analysis in Section 3.5, Economics, used PSRC data to account for future regional and local activity changes in regional population, employment, and housing. County assessor's data and subarea plans were used to examine existing and future land uses in the local area.

When combined with other foreseeable projects, the OMF South project is anticipated to have a small impact on the regional economy. There are potential additional impacts associated with OMF South when considered with FWLE and TDLE. It is possible that multiple construction projects taking place at the same time may exacerbate the economic effects described in Section 3.5 (including changes related to the potential displacement of employees and businesses), which may result in greater impacts. Sound Transit would minimize this through coordination of construction activities to limit potential disruption, such as through the development of transportation management plans. Construction of TDLE and the WSDOT SR 509 Completion Project could potentially occur at the same time as OMF South but are not currently expected to have substantial adverse impacts on the region when considered in the context of OMF South. Additionally, the combined job-creation impacts would be positive.

In Federal Way, the Woodbridge Corporate Park (Weyerhaeuser Campus) Redevelopment project started construction of two industrial buildings in 2022; once redevelopment is completed the campus is estimated to generate 3,100 new jobs (Industrial Realty Group 2022). Table 4.3-1 lists other reasonably foreseeable projects in Federal Way, some of which do not have an established schedule for completion. Without knowledge of when these projects will be completed or what their business impacts will be, this assessment cannot determine the potential cumulative economic impact in the context of the OMF South project.

Some of the potential cumulative effects from multiple projects may be offset by applying the same mitigation measures identified in Section 3.5, Economics, including coordination with businesses and districts during construction, signage to help patrons find businesses, and other measures.

4.4.5 Environmental Justice, Social Resources, Community Facilities, and Neighborhoods

Actions that occurred in the past, such as the development of the roadway and transit network within the study area, as well as implementation of prior land use plans, have resulted in the development patterns that shape the neighborhoods in the study areas. As a result of OMF South and other reasonably foreseeable future transportation projects, commercial and residential development projects, and land use changes, these neighborhoods could experience benefits. For example, the South Federal Way alternatives being evaluated for TDLE include a new light rail station within the study areas for the Preferred and South 344th Street alternatives. The neighborhoods surrounding a new light rail station would likely experience the greatest changes, including added transportation infrastructure and associated development. Additional benefits could include residential infill, growth in employment base, and greater support of local businesses.

Future private development, particularly around station areas, could increase property values and taxes and may affect the availability of affordable housing opportunities or affordable properties for small businesses. Affordable housing goals and policies of local jurisdictions and Sound Transit could encourage affordable housing options.

If OMF South were constructed at similar times as other large infrastructure projects, such as TDLE, residents and businesses could experience increased short-term construction impacts due to cumulative increases in congestion, noise, access limitations, and construction durations. Mitigation measures identified in Section 3.6, Environmental Justice, Social Resources, Community Facilities, and Neighborhoods would be implemented to reduce cumulative construction impacts on neighborhoods or community facilities.

4.4.6 Visual and Aesthetic Resources

Construction of I-5 in the 1960s, along with the associated commercial and residential development, was a major change to the visual environment in the project corridor. The freeway and corresponding development along SR 99 in recent decades also changed other more natural or rural landscapes. The addition of OMF South between SR 99 and I-5, along with several other planned road widenings and interchange improvements, would further increase the visual prominence of the transportation infrastructure.

If constructed at the same time as other reasonably foreseeable future actions, viewers could experience more visual impacts during construction. Cumulative visual impacts in the area could occur with increased private development near station areas associated with FWLE and TDLE. In addition, FWLE and TDLE, combined with OMF South, could have cumulative impacts due to additional elevated track and large structures. There would also be a cumulatively substantial clearing of trees and vegetation, particularly on the track alignments adjacent to I-5. Although most cumulative impacts would occur in previously developed areas or adjacent to other existing large infrastructure, thus making the cumulative nature of these impacts minimal, OMF South and other reasonably foreseeable projects could increase the overall impacts on the surrounding visual environment.

4.4.7 Air Quality and Greenhouse Gas Emissions

The operational air emissions from the build alternatives are inherently cumulative. The analysis found in Section 3.8, Air Quality and Greenhouse Gas Emissions, finds that the build alternatives would not result in an exceedance of the National Ambient Air Quality Standards or the Washington Ambient Air Quality Standards. While there is a potential for construction schedules to overlap with other projects in the area, the temporary nature of air quality construction impacts and the use of standard construction BMPs makes it unlikely that air quality standards would be exceeded. Therefore, the proposed project, combined with past, present, and reasonably foreseeable future actions, would not contribute to a cumulative adverse impact on air quality or GHG emissions. Additionally, because OMF South is necessary for the efficient operation of the Sound Transit 3 light rail system expansion, its construction and operation would support a cumulative regional reduction in vehicle miles traveled that would result in a cumulative decrease in regional auto-related emissions that contribute to GHGs (Sound Transit 2016a).

4.4.8 Noise and Vibration

Cumulative impacts for the OMF South project would be associated with TDLE and Federal Way’s proposed City Center Access Project for the Preferred and South 344th Street alternatives. There would be no cumulative noise impacts associated with the Midway Landfill Alternative.

If TDLE is constructed, approximately 144 LRVs would be needed and stored at OMF South. With the additional vehicles, there would be additional operations within the facility, including additional LRV movements into and out of the facility in the morning and evening, respectively. Additionally, for the Preferred and South 344th Street alternatives, the LRVs leaving and entering would be split between the northern and southern tracks leading to the mainline tracks. The additional LRVs from TDLE operating from within the OMF South alternative sites would increase some noise levels, but they would not be loud enough to cause FTA noise impacts or WAC exceedances (see Appendix G2, Noise and Vibration Technical Report).

The mainline tracks connecting the Preferred and South 344th Street alternatives would become the operational track for TDLE, with higher speeds and additional LRV operations throughout the day. As a result, the operation of TDLE on the mainline tracks is anticipated to cause additional noise impacts to residences near the mainline tracks in Belmor from the 40 mph Alignment and 55 mph Design Option. Impacts would occur where the mainline curves south of S 324th Street and near the mainline north of S 336th Street. The larger number of trains that would be in revenue service along the mainline with TDLE would have a greater impact than the number of trains moving to and from the OMF site with the OMF South project only. There would be no cumulative noise impacts from TDLE for the Midway Landfill Alternative because the mainline tracks adjacent to the site would already be built as part of FWLE and operating as revenue-generating tracks.

There would be no vibration impacts associated with OMF South. With the inclusion of the TDLE project, there would be an increase in vibration levels due to the higher speed of the trains, but no cumulative vibration impacts are anticipated. With the Midway Landfill Alternative, there would be no cumulative vibration impacts from the FWLE project.

Further details regarding TDLE noise and vibration impacts and mitigation will be included in the Tacoma Dome Link Extension Draft Environmental Impact Statement, which is expected to be published in mid-2024.The Draft EIS will include recommended mitigation measures, such as noise barriers, for any noise impacts on sensitive receptors near the mainline tracks needed for operations of TDLE. To improve efficiency and eliminate the impacts of two construction activities in the same location, the OMF South project is anticipated to construct noise mitigation required for TDLE if the Preferred Alternative or South 344th Street Alternative is selected as the project to be built.

The City Center Access Project together with OMF South and TDLE could result in some cumulative noise impacts to a small number of receptors south of S 324th Street without mitigation. The City Center Access Project proposes to extend S 324th Street across I-5 to the east, which may increase motor vehicle traffic noise that would require mitigation.

4.4.9 Ecosystem Resources

Past actions and urban development have changed the ecological landscape in the study area and vicinity, and ongoing and reasonably foreseeable future actions could contribute to additional cumulative impacts. To address the effects of past development, restoration programs and projects (e.g., aquatic and terrestrial habitat improvement projects as well as culvert replacement projects to eliminate barriers to fish passage) are being planned and implemented throughout the region. The potential for any of the build alternatives to result in adverse cumulative impacts would be related to the direct impacts of that alternative. In other words, a build alternative with a greater extent and/or intensity of adverse impacts on ecosystem resources would have a greater risk of adverse cumulative impacts.

Sound Transit's FWLE project is currently in construction. The mitigation report for FWLE identified impacts on 0.9 acre of wetlands, 4.5 acres of wetland buffer, and 0.2 acre of riparian forest buffers. In addition, the Federal Way Link Extension Final Environmental Impact Statement identified impacts on 35 acres of forested habitat (Sound Transit 2016b). That Final EIS also analyzed impacts associated with the relocation of approximately 1,000 linear feet of stream channel. These impacts will be mitigated through the permitting process with regulatory agencies and local jurisdictions. The project was designed to allow WSDOT to implement fish passage improvements on Bingaman Creek in the future, if necessary (FTA 2017). In addition, by complying with WSDOT and local jurisdictional rules concerning tree replacement, FWLE is expected to increase the amount of vegetated area over the long term.

Table 4.4-1 lists other reasonably foreseeable future projects that could affect ecosystem resources in the study area.

Most of these projects are on developed or partially developed parcels. Nevertheless, possible short-term and long-term impacts of these projects include loss or degradation of vegetation, wildlife habitat, streams, wetlands, and associated buffer areas. Between OMF South, FWLE, and TDLE, there would be substantial clearing of trees and vegetation with adverse cumulative effects on forested habitat, particularly on the alignment routes adjacent to I-5.

Coupled with the impacts of the past, present, and future projects described above, the impacts of the build alternatives could contribute cumulatively to reductions in the area and function of ecosystem resources in the study area. Sound Transit commits to meeting or exceeding requirements for mitigation and compensating for project impacts to ecosystem resources during design and permitting. The potential for future projects to adversely affect ecosystem resources in the study area would be limited by meeting regulatory requirements under federal, state, and local regulations. These reviews and permitting processes would ensure the implementation of measures to avoid or minimize both short-term and long-term impacts on ecosystem resources as well as compensatory mitigation for unavoidable impacts on wetlands, streams, and their buffers. It may take several years for the forested vegetation communities or decades for mature forested communities to return to their preconstruction habitat function.

Table 4.4-1 Ecosystem Resource Impacts from Reasonably Foreseeable Future Projects in the Study Area

Project	OMF South Alternatives Potentially Affected	Potential Ecosystem Impacts
Sound Transit TDLE	Preferred South 344th Street	TDLE is proposed along the west side of I-5 and would impact East Fork Hylebos Tributary, associated wetlands, and riparian buffers.
Federal Way City Center Access Project	Preferred South 344th Street	The project design includes the replacement of three state-owned culverts where East Fork Hylebos Tributary crosses I-5 (WDFW Site ID numbers 995300, 995299, and 992364), plus a privately owned culvert at Winged Foot Way (WDFW Site ID number 420614) that is directly connected to culvert 992364.
The Creekside Commons Townhome Development	Preferred	Proposed on about 10 acres of forested land north of the Preferred Alternative, clearing and site development will reduce the width of the forested buffer on West Fork Hylebos Tributary in that area.
WSDOT I-5/SR 161/SR 18 Triangle	Preferred South 344th Street	Vegetation clearing and ground-disturbing work for this project could affect East Fork Hylebos Tributary south of the OMF

Table 4.4-1 Ecosystem Resource Impacts from Reasonably Foreseeable Future Projects in the Study Area (continued)

Project	OMF South Alternatives Potentially Affected	Potential Ecosystem Impacts
Interchange Vicinity Improvements (project suspended with no resumption date set)		South alternatives in Federal Way. WSDOT plans to replace an approximately 370-foot-long culvert with approximately 560 linear feet of open channel, removing an existing, partial barrier to fish passage and increasing the amount of functioning aquatic and riparian habitat available in the stream system. This project would also remove several other partial or complete barriers to fish passage on this stream downstream of the study area
WSDOT SR 509 Completion Project (part of the Puget Sound Gateway Program)	Midway Landfill	The only proposed project element near the site is an auxiliary lane on southbound I-5. Construction of an auxiliary lane in that area would be unlikely to adversely affect ecosystem resources at or near the Midway Landfill Alternative. WSDOT will be expanding the wetland and stream habitat complex as part of the Program's Riparian Restoration Plan. This entails enhancing over 153 acres of wetland, riparian, and forested habitat, forming a critical link to previously established mitigation sites located downstream of the two Federal Way OMF proposed alternative sites. The proposed site is in Fife, adjacent to I-5 in the area known locally as the Fife curve.

4.4.10 Water Resources

Development throughout the Puget Sound region has substantially altered the hydrology of drainage basins, including substantial changes in water quality and flow in the Hylebos Creek basin. Population growth and the accompanying substantial urbanization and associated increase in pollution-generating impervious surfaces have increased runoff volumes and contaminant loading to surface water bodies and have decreased groundwater infiltration and recharge, which plays a critical role in dry-season baseflow contributions.

The proposed project would be required to manage runoff in compliance with federal, state, and local regulations, which would avoid and minimize impacts on surface and groundwater. The mitigation would include providing flow control and water quality treatment for runoff from some existing impervious and pollution-generating surfaces that may either be currently uncontrolled or not manage to current standards. Updating infrastructure to comply with current regulations can prevent further harm to water resources and could lead to gradual improvements to water quality over time. Advances in flow control methods aim to simulate predevelopment conditions but are typically not able to completely reproduce them.

Over time, other regional new development and redevelopment are expected to bring many existing impervious and pollution-generating surfaces up to current standards of flow control and water quality treatment for stormwater runoff. Improvements in stormwater runoff control and water quality would occur over time, with or without this project, meaning the changes could be expected to be smaller and more gradual. This retrofit through redevelopment would avoid additional impacts to water resources in the area and could result in modest improvements in the hydrology and water quality of the streams within the OMF South study area.

Additionally, the expanded Link light rail system, which the OMF South project would support, would slow the increase in vehicle miles traveled as population in the area increases. This slowing of the increased vehicle use would mean slower increase in polluted runoff and future impacts to water quality.

4.4.11 Geology and Soils

OMF South would be entirely within a highly urbanized area. In general, surface geology and soil conditions have already been substantially altered, particularly for the Midway Landfill Alternative. The proposed earthwork for the Preferred and South 344th Street alternatives would have little or no meaningful impact on existing, long-term geologic, hydrogeologic, or soil conditions in the study area. Similarly, even though the Midway Landfill Alternative could result in a substantial amount of earthwork, depending on the subsurface construction design option, it is not expected to contribute to substantial cumulative impacts when added to potential impacts for other reasonably foreseeable actions expected within the study area.

4.4.12 Hazardous Materials

Similar to other projects in the vicinity, Sound Transit would adhere to applicable regulations regarding the handling and treatment of contaminated materials during construction and long-term operation of the projects. While construction and operation of OMF South at the Midway Landfill Alternative site would have the potential to result in the release of hazardous materials or contamination of air or groundwater, plans for the mitigation, handling, and disposal of contaminated media and hazardous construction debris would be developed in conjunction with the appropriate regulatory agencies. As a result, the proposed project is not anticipated to have an adverse effect and could have a net beneficial impact on the environment. Similarly, all other related projects’ development would require the remediation of any contaminated sites encountered in compliance with state and federal environmental regulations, consequently improving overall environmental quality. Therefore, there would be no cumulative impacts of the related projects when combined with the proposed projects, on hazardous materials in the build alternative sites.

4.4.13 Public Services

The OMF South project would not increase demand for public services; however, planned growth in population, employment, and general urban activity in the study area would affect public service demand, including emergency and public safety services. The FWLE and TDLE projects, supported by OMF South, would support a greater density of development, particularly near planned light rail stations which are generally attractive to businesses and residents. The FWLE Kent/Des Moines Station is within the Midway Landfill Alternative study area, and a new light rail station proposed in South Federal Way for TDLE is within the study area for the Preferred and South 344th Street alternatives. Therefore, the cumulative impacts associated with increased development could lead to additional demand for public services, such as emergency services, within the OMF South study area. These incremental increases are anticipated to be minor.

4.4.14 Utilities, Energy, and Electromagnetic Fields

Utilities

Development near the project would be consistent with what is allowed in the adopted land use plans and current local development regulations. Therefore, the cumulative impacts on utilities would be negligible and in accordance with planned growth.

Energy

The proposed OMF South project would result in net increases in electricity and natural gas consumption and demand under all build alternatives. It is anticipated that PSE would have sufficient capacity and energy resources to accommodate any increase in energy consumption. When considered together with the reasonably foreseeable future projects, as well as ongoing local, regional, and statewide efforts to increase energy efficiency and conservation, the proposed OMF South project would not contribute to a cumulative adverse energy impact. Additionally, the expanded Link light rail system, which the OMF South project would support, would lead to a regional reduction in vehicle miles traveled, which would lead to a reduction in the use of oil, gasoline, and diesel fuels (Sound Transit 2016a).

Electromagnetic Fields

The FWLE Final EIS notes that there are no potentially EMF-sensitive receptors close to the FWLE alignment (Sound Transit 2016b). Similarly, there are also no potentially EMF-sensitive receptors close to the proposed TDLE alignment or OMF South alternatives. No areas were identified where EMFs would combine with past, present, or future actions to result in human health effects or effects on facilities with EMF-sensitive equipment. Therefore, no EMF cumulative impacts would result from the proposed project.

4.4.15 Historic and Archaeological Resources

OMF South is not expected to result in significant impacts to cultural resources. All build alternatives have the potential to affect unidentified archaeological resources within the study area, but the only known historic properties are the Tacoma-Covington No. 2, 3, and 4 and Tacoma-Raver No. 1 transmission lines, which OMF South would not adversely effect. The project has an Inadvertent Discovery Plan to address the potential discovery of archaeological resources during construction. Appendix G4, Historic and Archaeological Resources Technical Report includes the plan.

The reasonably foreseeable future actions in the project vicinity, including the Link system expansion projects that OMF South would support, may have direct impacts on historic or archaeological resources in the study areas. The settings surrounding these resources have been altered by past and present redevelopment and general changes in uses surrounding them. If OMF South encounters unidentified archaeological resources during construction, it could contribute to a cumulative impact on historic and archaeological resources.

4.4.16 Parks and Recreational Resources

No major changes to parks or recreational resources by OMF South or other reasonably foreseeable future projects or actions are anticipated. Population and employment growth are expected to occur under both the No-Build and the build alternatives and would likely increase the use of parks and recreational facilities throughout the project area.

5 COMMENT SUMMARY

See Appendix L for full comments and responses to both the 2021 SEPA Draft EIS and the 2023 NEPA Draft/SEPA Supplemental Draft EIS.

5.1 Overview of the 2021 Draft Environmental Impact Statement Comment Period

Sound Transit published the OMF South SEPA Draft Environmental Impact Statement on March 5, 2021. The comment period was from March 5 to April 19, 2021. Sound Transit extended the required 30-day comment period by an additional 15 days to give reviewers more time to consider the document. Opportunity to comment was provided by online comment form, email, phone, U.S. mail, and verbally during online public hearings. Due to COVID-19 restrictions, the two public hearing events were held virtually during the 45-day comment period.

Sound Transit held two online informational meetings/public hearings using Zoom:

- Wednesday, March 24, 2021, 5:30 p.m. – 7:30 p.m.
- Tuesday, March 30, 2021, 11:00 a.m. – 1:00 p.m.

The meetings/public hearings were held a week apart on different days of the week and at different times of day to accommodate varying stakeholders’ ability to attend and participate. Table 5.1-1 summarizes the type of commenters who provided feedback.

Table 5.1-1 Comments Received by Commenter Type

Commenter Type	Number
Federal Agency	0
Tribe	1
State Agency	2
Regional and Local Agency of Jurisdiction	6
Elected Officials	1
Businesses and Community Groups	12
Individual	250
Total	**272**

5.1.1 Comments from Tribes, Agencies, and Jurisdictions

The Puyallup Tribe of Indians, along with several state, regional, and local agencies, provided comments as summarized below.

5.1.1.1 The Puyallup Tribe of Indians

The Puyallup Tribe of Indians Fisheries Department stated that they prefer that OMF South be placed at the Midway Landfill. The Tribe’s comments primarily concerned impacts to ecosystems (streams, riparian buffers, and downstream fish habitat) as well as water resources (water quality and groundwater recharge). The Puyallup Tribe of Indians Fisheries Department noted the significant effort and resources of the Tribe, the Natural Resource Damage Trustees, the city of Tacoma, the Port of Tacoma, and WSDOT that have been applied towards property acquisition, habitat restoration, cleanup, and stream enhancement throughout the Hylebos Creek watershed over the past two decades as well as future planned improvements to Hylebos Creek downstream of Federal Way, which would be affected by the project.

The Puyallup Tribe of Indians Fisheries Department also highlighted the importance of the protection and treatment of stormwater at OMF sites and the potential downstream effects to Hylebos Creek. The Puyallup Tribe of Indians is opposed to any proposal that would place more of the creek or its tributaries in pipes or culverts. The Tribe is also opposed to any proposal that would reduce water treatment opportunities or recharge of the creek.

Tribal data shows that Chinook salmon have been documented as far north as S 356th Street in Federal Way. The Puyallup Tribe of Indians Fisheries Department asked that the description of the distribution of Chinook salmon be revised to reflect tribal fisheries data in the Final Environmental Impact Statement.

5.1.1.2 State Agencies

Washington State Department of Ecology

Ecology’s comments on the 2021 SEPA Draft EIS focused on the Midway Landfill Alternative, and most comments were on the Midway Landfill Support Documents, Appendices D1 through D4. Generally, Ecology asked questions about the assumptions that were made for the amount and suitability of fill material for reuse, cost estimates associated with excavation scenarios, and the allowed acreage of exposed landfill. They asked how the assumptions and analysis might be different based on what Sound Transit has learned from working within the Midway Landfill on FWLE, including reuse percentages, hazards of landfill materials, and observed schedule risk.

Washington State Department of Transportation

The comments from WSDOT were primarily related to potential impacts to visual and aesthetic resources, the planned mitigation for impacts to roadside vegetation, and the two Resource Conservation Areas along I-5. For example, they noted that Resource Conservation Area mitigation requirements — the primary of which is avoidance — are different from vegetation replacement requirements, and the two should be treated differently. In addition, they asked that the impact to high-sensitivity viewers, such as tourists, sightseers, and people driving for pleasure, be included in the analysis.

WSDOT noted that the Midway Landfill Alternative figures show the potential limits of construction to the edge of I-5. They stated that it is not likely that Sound Transit would be allowed to use or cross through that area during WSDOT’s construction of the SR 509 completion project, anticipated to occur between 2024 and 2028.

Last, WSDOT stated that upcoming state legislation (the new HEAL Act) will require consideration of impacts to environmental justice and vulnerable populations. WSDOT asked how the Board will consider the potential impacts of the OMF South project to these populations in their decision-making process.

5.1.1.3 Regional and Local Agencies and Jurisdictions

King County Metro

King County Metro is primarily concerned with impacts to transit for each of the OMF South alternatives, particularly the proposed use of SR 99 as a haul route during site construction. They noted that construction of OMF South at the Midway Landfill Alternative would likely have the greatest impact to their operations.

Metro asked Sound Transit to include transit-specific mitigation in the Final EIS and to include transit in the construction transportation management plan. Their letter suggested specific traffic study revisions to clarify how LOS is measured and defined at intersections under two-way stop control. Metro also asked to clarify truck traffic impacts at S 272nd Street, Kent-Des Moines Road, and the SR 99 northbound HOV lane during construction for the Midway Landfill Alternative, along with the potential traffic impacts of the proposed mitigation measures for the S 246th Street/SR 99 intersection.

City of Des Moines

The city of Des Moines supports light rail expansion as long as it does not adversely affect the surrounding neighborhoods, including Highline College, the Kent-Des Moines station area, and the business district along SR 99, or livability for current residents, workers, and shoppers. Des Moines supports the Midway Landfill Alternative because its use avoids the impacts associated with the two Federal Way alternatives.

As for specific comments, Des Moines suggested an LOS analysis for construction traffic and for additional intersections, called for a more detailed evaluation of potential mitigation for construction haul routes, and asked whether new PM peak hour trips would be added. In addition, Des Moines asked to be included as a reviewing agency for the Drainage Site Plan, Technical Information Report, and the Stormwater Pollution Prevention Plan and as an affected agency for compliance review of the NPDES Stormwater Discharge Requirements.

If the Midway Landfill Alternative is identified by the Board as the preferred alternative, Des Moines states that Sound Transit will need to more fully develop or acknowledge impacts associated with the construction timeline; impacts on community and businesses from the number and duration of truck trips; and risks to human health from potential release of contamination. The city also asks Sound Transit to acknowledge that unknown risks from working in a Superfund site could affect construction schedule and costs.

City of Kent

The city of Kent does not object to the placement of OMF South within its city limits as long as it is placed at the Midway Landfill. The city asked for clarification on the project’s Purpose and Need, how OMF South fits with FWLE, and why the OMF South annual operating cost estimates would be higher for the Midway Landfill Alternative than for the South 336th and South 344th Street alternatives.

Concerning the transportation analysis, the city of Kent had several comments on LOS thresholds and mitigation and construction-related traffic impacts. Kent updated its Transportation Master Plan in March 2021 and asked that LOS standards and the list of anticipated projects in Kent be revised to reflect the new plan. Kent asked that Sound Transit consult with WSDOT regarding direct access to I-5 to minimize truck trips during construction if the Midway Landfill Alternative is selected by the Board, particularly for the Full Excavation and Hybrid subsurface design options. Additionally, Kent stated that a parking study will be required if the Midway Landfill Alternative is chosen to be built. The city also had several comments concerning impacts to land use and economics, such as asking for more detail on the businesses displaced, noting that the facility would be allowed under a conditional use permit, and asking for identification of the actual number of displaced employees.

As a general comment, Kent asked why OMF South is larger than OMF Central and OMF East. The letter also noted that the sizes of the build alternatives have grown since early discussions with Sound Transit and asked for an explanation.

Kent included several comments about the Midway Landfill Support Documents in Appendix D of the 2021 SEPA Draft EIS. These comments concern assumptions about the design and construction of OMF South at the landfill, such as the excavation work window, areas of open excavation allowed, and the diameter and spacing of drilled shafts. These comments generally ask how these assumptions were made and whether these assumptions could change or be revised to decrease construction cost and duration.

Further, Kent asked for a complete list of assumptions made for the analysis of each alternative. Last, the letter closed with a list of potential funding resources for building OMF South at the Midway Landfill.

City of Federal Way (Mayor and City Council)

The letter, signed by Federal Way’s mayor and all seven of its councilmembers, stated support for the Midway Landfill Alternative and opposition to the sites in Federal Way.

The letter questioned the inclusion of cost estimate information in the 2021 SEPA Draft EIS along with assumptions concerning the city of Federal Way’s approval for vacating public roads and modification of development standards to permit OMF South. The letter also questioned whether there are adequate mitigation opportunities for the identified impacts.

City of Federal Way (Public Works and Community Development Directors)

In a separate letter, the city of Federal Way provided technical comments and input on the 2021 SEPA Draft EIS. The letter began with several questions and comments about cost and schedule and stated that estimated project costs and construction schedules are not required to be considered under SEPA. The city suggested that only environmental impacts should be considered in a SEPA EIS.

The letter requested that several corrections and clarifications be made to the Transportation Technical Report. The city noted that Sound Transit will be required to mitigate all vacated public roadways by incorporating roadways of identical functionality in a manner that complies with the city’s block perimeter requirements and comprehensive plan. Federal Way disagrees with the 2021 SEPA Draft EIS data showing that vacating 20th Avenue S would have very little impact to response times for emergency service vehicles. The city asked that a north-south replacement route be provided.

Federal Way had several comments concerning economic and fiscal impacts related to employee and business displacement in addition to taxable valuations. The city hired an outside consultant (FCS Group) to review the economic analysis and attached their report to the letter. Generally, the city does not believe that the 2021 SEPA Draft EIS analysis considered the opportunity cost difference between the three site alternatives, stating that the Midway Landfill Alternative would have a relatively low opportunity cost in terms of re-developable lands as compared to the site alternatives in Federal Way.

The city's comments about land use impacts concerned the compatibility of OMF South with the surrounding uses and with comprehensive plan policies. The city noted that the project design is not advanced enough to determine whether adequate room exists for appropriate compatibility between land uses. Similarly, related to cumulative impacts, the city noted that TDLE and OMF South (should a Federal Way site be chosen) will convert land in the only light industrial zone in Federal Way, which could lead to sprawl or development of previously undeveloped land. The city stated that the 2021 SEPA Draft EIS should have included a comprehensive analysis of the cumulative impacts of this land conversion.

Federal Way stated that mitigation described in the ecosystems and water resources sections of the 2021 SEPA Draft EIS is written in a broad manner and needs to include more specifics to evaluate the feasibility of the South 336th and South 344th Street alternatives. This concern was noted particularly over mitigation and compliance with city regulations. The city also included comments on the noise and visual analyses. Regarding the visual analysis, the city stated that visual impacts to the historic Weyerhaeuser campus were not adequately addressed. The city also asked about assumptions in Appendix G2, Noise and Vibration Technical Report, concerning verification of project noise levels and audible signals at light rail crossings.

Seattle Public Utilities

SPU provided specific comments on the 2021 SEPA Draft EIS, focusing on the Midway Landfill Alternative. SPU notes concerns over the depth and type of fill and the potential for settlement and offers suggestions to mitigating these concerns. SPU disagrees with the 2021 SEPA Draft EIS's assumption that the construction of OMF South at the Midway Landfill would lead to the greatest conversion of pervious surface to impervious surface, noting that the current landfill cap is designed to be impervious, and therefore there would be little to no conversion.

SPU asked how various assumptions or risks identified in the 2021 SEPA Draft EIS compared to what was experienced during FWLE construction, as SPU implied that the assumptions for OMF South are too conservative. These include managing the landfill gas collection system, construction work windows, landfill material reuse, haul truck size, tolerances for settlement, and mitigation of hazardous materials removal. For example, SPU points to the fact that during FWLE construction, excavation within the landfill was not restricted to 22 weeks and that screened waste was transported in 48-foot containers instead of 20-foot containers.

SPU asked how Sound Transit developed estimates for real estate and relocation costs because they believe the estimate for the Midway Landfill Alternative is high. They also noted that there would likely be less chance of delays and costs associated with appeals or lawsuits for the Midway Landfill Alternative and asked whether Sound Transit should include that as a consideration.

5.1.1.4 Elected Officials

Representative Jesse Johnson

At the time of publication of the 2021 SEPA Draft EIS, Jesse Johnson was the Washington State Representative for the 30th Legislative District, which includes the cities of Des Moines and Federal Way. In his comment, Representative Johnson requested that OMF South not be considered in Federal Way, based on input from his constituents.

5.1.2 Comments from Businesses and Community Groups

Sound Transit received 12 communications from the following potentially affected businesses and community groups:

- Christian Faith Center
- Pacific Christian Academy
- Ellenos Yogurt
- Schindler Family Limited Partnership
- GarageTown
- Red Canoe Credit Union
- Federal Way Custom Jewelers
- Northwest Equipment and Sales
- Race King, LLC
- 1910 and 1934 South 344th Street
- Federal Way Chamber of Commerce
- Protect Federal Way

Christian Faith Center

Christian Faith Center submitted a comment letter stating that they would prefer that the Christian Faith Center property was not part of any alternative. The letter explains that the Christian Faith Center entered into a Development Agreement with the city of Federal Way related to property development, which contains commitments related to stormwater management, site access, mitigation, and recreational areas. The agreement — the Concomitant and Development Agreement and Development Plan — is attached to the comment letter.

The letter also states that since Sound Transit identified the site as a potential alternative, campus development has been “stuck” in place and time. The Christian Faith Center has stopped planning and implementing projects, and their members have been anxious about the future of their church. Under the South 336th Street Alternative, Christian Faith Center would be relocated and start a multiyear redevelopment process. Under the South 344th Street Alternative, the church would also need to be relocated because the smaller site would leave them without the physical space necessary to meet the requirements of the Development Agreement with the city of Federal Way.

Pacific Christian Academy

Pacific Christian Academy notes that it is the largest Christian school in the Federal Way area and has a very diverse student body. The school has looked for options for a new site and has been unable to find an available site in the area. Pacific Christian Academy acknowledges Sound Transit's outreach efforts and meetings with their Board of Trustees. They hope to have Sound Transit's assistance in finding a new location, should their site be chosen for OMF South.

Ellenos Yogurt

The co-founders and current CEO of Ellenos Yogurt submitted a comment letter. They state that relocating their yogurt manufacturing facility would be catastrophic to their business. Ellenos Yogurt plans to start national distribution over the next 3 to 5 years and become a 24/7 operation. The nature of the product is such that it has a short shelf life and cannot be stockpiled while the facility is moved.

Also, they state that a new facility will take a minimum of a year to build and test to ensure it meets product safety and quality parameters, and it would have to be fully functioning before they could close their current location. Ellenos Yogurt believes it would cost tens of millions of dollars to duplicate their existing facility and that the opportunity costs to their business would be virtually incalculable. The letter states that relocation costs alone are estimated to be over $25 million, which does not account for tens of millions of dollars of additional opportunity costs. They ask Sound Transit to choose a different alternative.

Schindler Family Limited Partnership

Stephen Causseaux, the managing partner for the Schindler Family Limited Partnership that owns the Ellenos Building, sent a letter under the letterhead of his law firm, McCarthy and Causseaux, expressing concerns similar to those from Ellenos Yogurt. The letter includes comments on the 2021 SEPA Draft EIS concerning the value of and number of properties to be acquired, the nonexempt status of the Christian Faith Center, and impacts to WSDOT's Resource Conservation Areas. Similar to comments from the Ellenos co-founders and CEO, the letter cites concern over Ellenos Yogurt's need to have a second, fully functioning operation prior to relocation, the costs of relocation, and the lost opportunity costs. The letter states that selecting the South 344th Street Alternative would "put an end to Ellenos Yogurt".

GarageTown Condominium Association

Brad Thorson, the president of the GarageTown Federal Way Condominium Association, submitted two emails with comments on the 2021 SEPA Draft EIS. In his first email, Mr. Thorson notes that the document should treat all 67 of the GarageTown tenants as individual property owners rather than GarageTown being treated as one business and that the parcel count should treat each GarageTown unit as separate parcels. Mr. Thorson states that he does not believe that GarageTown could be relocated in King County with the amount of money they would likely receive from Sound Transit and that their "community would be destroyed" as a result. Other comments concerned such things as the difficulty and cost of relocating Ellenos Yogurt, the number of churches impacted by the South 344th Street Alternative, and the fact that roadway improvements would be needed. He also asked that differences in impacts between sites be made clearer.

In his second email, Mr. Thorson again suggests that GarageTown owners be counted as individual commercial or residential owners so as not to distort the number of individuals impacted.

He mentions the fact that the South 336th Street and South 344th Street alternatives would require excess mainline track if TDLE is not constructed and asks whether Sound Transit has sought out any federal or state grant funds to assist with construction of the Midway Landfill Alternative. Mr. Thorson also mentions that the Christian Faith Center may want to sell to Sound Transit.

Several comment letters were sent by owners of GarageTown units and were similar to the first email from Mr. Thorson.

Red Canoe Credit Union

The Red Canoe Credit Union submitted comments on behalf of their branch at S 336th Street and Pacific Highway South. They are concerned that construction of the South 336th Street Alternative may make it difficult for people to access the bank due to construction vehicle traffic and that access to their site would be closed due to roadway or sidewalk construction. They request that construction truck traffic access the freeway from S 336th Street and Weyerhaeuser Way S rather than using SR 99 and that both lanes of S 336th Street never be closed at the same time. The Credit Union supports the Midway Landfill as the best location for OMF South because it has the least impact on community and businesses and repurposes the landfill.

Federal Way Custom Jewelers

The owner of Federal Way Custom Jewelers supports the Midway Landfill Alternative. He expressed concern over the potential loss of clients if either the Christian Faith Center or Ellenos and other businesses are displaced. His comments note that the south Sound region has high levels of low-wage workers, people of color, and commuters who could rely on transit, yet they are getting light rail after other areas to the north and east.

Northwest Equipment Sales and Rentals

The owner of Northwest Equipment Sales and Rentals expressed concern over the potential displacement of his property at 2011 S 341st Place in Federal Way. He stated that there currently is no available property zoned M2 or M3 and therefore the South 344th Street Alternative could have a devastating effect on his business.

Race King LLC

Scott Halverson submitted a comment letter as the owner of the Race King LLC commercial property along Pacific Highway S (SR 99), within the footprint of the Midway Landfill Alternative. His concern is that further condemnation or easements would render his property unusable for the two businesses he currently runs. Mr. Halverson is willing to sell his property to Sound Transit as long as he could find a suitable replacement.

1910 and 1934 South 344th Street

Greg and Donna Olson shared concerns about their commercial properties within the South 344th Street Alternative footprint. Along with listing information about the properties and their surroundings, they express concern about legal costs due to terminating their current lease agreement, recouping the money spent making capital improvements, and the difficulty of finding comparable properties elsewhere that could provide the same income. They invite Sound Transit to contact them for further discussion as needed.

Greater Federal Way Chamber of Commerce

The Greater Federal Way Chamber of Commerce is focused on economic diversity in Federal Way, including the maximum retention of commercial enterprises and what would be most favorable to new and existing economic opportunities. In their comment letter, the Chamber stated that transportation infrastructure is a priority to meet the demands of a growing business community in the South Puget Sound region and that OMF South is a critical component for the southern expansion of light rail. They ask that the Board note the guiding principles important to the Chamber in the evaluation of the three sites: creation of permanent, sustainable living wage jobs; minimum business displacement for existing jobs; enhanced opportunities for transit-adjacent development; impact of economic multipliers in the community; environmental issues, including health concerns and the stewardship of resources such as wetlands and trails; and cost of strategic growth for transportation infrastructure.

Protect Federal Way

Protect Federal Way is a federally registered, nonconnected Political Action Committee opposed to the selection of the South 344th Street Alternative. Their comment letter restates some of the conclusions of the 2021 SEPA Draft EIS and then states some additional concerns regarding the alternative. Protect Federal Way believes that relocation costs will be increased for businesses at the South 344th Street Alternative due to their industrial nature and states that comparable properties are not available in the area. They note that the site includes the last industrial zone in Federal Way, and they believe the selection of the site will “evict all industrial businesses from Federal Way, permanently.” Protect Federal Way believes that the real estate costs associated with the properties necessary for business relocation should be included in the 2021 SEPA Draft EIS.

Protect Federal Way also believes that many small businesses will close rather than relocate and associated jobs will be lost. They state the South 344th Street Alternative has the most painful and highest cost to their community and ask that it be removed from consideration.

5.1.3 General Public Comments

During the OMF South SEPA Draft EIS comment period, Sound Transit received 250 communications from the general public. The most common general themes in the public comments, outside of statements for or against a particular alternative, concerned impacts to the community or neighborhood due to displacements of residents, businesses, and employees as well as impacts to natural resources such as streams, wetlands, and habitat.

5.1.3.1 Alternative Preference

Most of the communications from the public expressed a preference for or against a specific alternative site. In general, most comments supported the Midway Landfill Alternative and/or opposed the South 344th Street Alternative.

Of the approximately 250 public commenters, about 210 people expressed support for a particular site: 160 people for the Midway Landfill Alternative, 40 people for the South 336th Street Alternative, and 10 people for the South 344th Street Alternative. At the same time, approximately 160 people expressed opposition for a particular site: 10 people against the Midway Landfill Alternative, 40 people against the South 336th Street Alternative, and 110 people against the

South 344th Street Alternative. Many people expressed preferences both for and against multiple site alternatives; each preference statement was tallied individually.

Approximately 30 people suggested alternative sites other than those evaluated in the 2021 SEPA Draft EIS. Some of the suggestions, including the former Weyerhaeuser property and the Puyallup-Kits Corner Landfill, were for OMF South locations that were previously analyzed during the alternatives evaluation and not advanced for further consideration.

The reasons for the alternative preferences are described in the sections below, specific to each of the 2021 SEPA Draft EIS build alternatives.

South 336th Street Alternative

Approximately 80 people expressed opinions regarding the South 336th Street Alternative. The preferences were split, with 47 percent of people supporting the site and 53 percent of people opposing the site.

Approximately 60 people mentioned the Christian Faith Center church and school. Some expressed concerns about impacting the Christian Faith Center because it is a place of worship for many, includes a school and daycare, and contributes to the community. Others mentioned the development agreement that Federal Way made with the Christian Faith Center and questioned how that agreement would apply to OMF South. Finally, others felt the South 336th Street Alternative made sense as compared to the Midway Landfill and South 344th Street alternatives, mentioning that the Christian Faith Center may be looking to sell its property.

The reasons given in support of the South 336th Street Alternative were generally that it struck a balance by having fewer impacts to residents, employees, and businesses than the South 344th Street Alternative and would be less costly, faster, and less risky than the Midway Landfill Alternative.

Opposition to the South 336th Street Alternative centered on impacts to residents, employees, and businesses — including organizations like the Christian Faith Center — and, to a lesser extent, the impacts to the natural environment, such as wetlands and streams. Many commenters expressed concerns over the loss of affordable, single-family residences and the impacts to their neighborhood or community due to the property acquisition and displacements that OMF South would require.

South 344th Street Alternative

Approximately 120 people expressed an opinion regarding the South 344th Street Alternative, and of those, about 93 percent opposed the site.

Public opposition to the South 344th Street Alternative centers on potential impacts to the natural and built environment. Of those who provided reasons for opposing the South 344th Street Alternative, the majority cited the greater impact that it would have to residents, businesses, and jobs (the most of any of the three alternatives). Similar to comments over the South 336th Street Alternative, many comments expressed concerns over the loss of affordable, single-family residences and the impacts to their neighborhood or community due to the property acquisition and displacements that OMF South would require. Others cited impacts to the natural environment, including streams and habitat.

Of those who expressed an opinion about the South 344th Street Alternative, approximately half mentioned concerns over the displacement of GarageTown and Ellenos Yogurt. The comments stressed that there are over 60 individual property owners of GarageTown, many of whom operate businesses out of their respective units, and it would be very difficult if not impossible to relocate the entire facility. In addition to concerns about job loss, the comments pertaining to Ellenos Yogurt emphasized the fact that the current manufacturing facility could not simply be relocated into a new facility; rather, it could take over 2 years to build up a new facility in which to transfer operations before closing the current one.

Approximately eight people supported the South 344th Street Alternative. Reasons for supporting the site included improvements to the neighborhood, the location of the site in relation to the Link system, and because the South 344th Street Alternative has a lower cost and shorter construction schedule compared to the other build alternatives.

Midway Landfill Alternative

Approximately 170 people expressed an opinion regarding the Midway Landfill Alternative, and of those, about 95 percent supported the site. Some people specifically mentioned a preference for the Full Excavation or Platform subsurface construction design options. No commenter expressed a preference for the Hybrid subsurface construction design option.

The reasons most often given for support of the Midway Landfill Alternative were that it would have the fewest impacts to the natural and built environment and that it would provide an opportunity to clean up and improve an otherwise contaminated, vacant site. Of those who provided reasons for supporting the Midway Landfill Alternative, many cited the greater impact that the South 336th Street and South 344th Street alternatives would have to businesses, jobs, residents, and/or the natural environment.

People recognized that the Midway Landfill Alternative would be more expensive and take longer to construct, but many felt it was worth the extra cost and time. Several people suggested that Sound Transit investigate additional funding opportunities via the state and/or federal government for converting the Midway Landfill to a usable OMF site.

Reasons given in opposition to the Midway Landfill Alternative include the larger cost, longer construction time frame (and therefore greater construction impacts), and concerns over potential hazardous materials pollution.

5.2 Overview of the 2023 NEPA Draft/SEPA Supplemental Draft Environmental Impact Statement

The 2023 NEPA Draft/SEPA Supplemental Draft Environmental Impact Statement was published on September 22, 2023. There was a 45-day comment period, during which Tribes, agencies, and members of the public were invited to comment. The comment period ended November 6, 2023.

An online open house was live for the duration of the comment period (September 22 to November 6, 2023). The public could visit the website to review what had changed since the 2021 SEPA Draft EIS, review a summary of the findings of the 2023 NEPA Draft/SEPA Supplemental Draft EIS and supporting materials, and submit comments via an online comment form.

Sound Transit hosted one online public meeting and one in-person public meeting to provide general information about the Draft EIS and offer attendees the opportunity to provide public comment. The online public meeting was held on Zoom on Thursday, October 19, from

11:30 a.m. to 1:30 p.m., with more than 20 people attending. The in-person meeting was held at the Federal Way Performance Arts & Events Center on Tuesday, October 24, from 5:30 to 7:30 p.m., with approximately 25 attendees.

Table 5.2-1 summarizes the type of commenters who provided feedback.

Table 5.2-1 Communications Received by Commenter Type

Commenter Type	Number
Tribe	1
Federal Agency	2
State Agency	1
Local Jurisdiction	1
Business or Community Group	1
Individual	52
Total	**58**

5.2.1 Comments from Tribes, Agencies, and Jurisdictions

Sound Transit received five communications from the following Tribes, federal and state agencies, and local jurisdictions:

- Suquamish Indian Tribe of the Port Madison Reservation (Suquamish Tribe)
- EPA
- FHWA
- WSDOT
- City of Federal Way

5.2.1.1 Tribes

Suquamish Tribe

The Suquamish Tribe confirmed receipt of the 2023 NEPA Draft/SEPA Supplemental Draft EIS and stated that they had no comments or concerns regarding cultural resources based on the analysis in the Historical and Archaeological Resources Technical Report (Appendix G4) and its associated attachments.

5.2.1.2 Federal and State Agencies

Environmental Protection Agency

EPA's comments focused on environmental justice. EPA believes OMF South has "the potential to disproportionately impact communities with environmental justice concerns, including tribal, minority, and low-income communities."

EPA asks that the Final EIS further evaluate and identify communities with environmental justice concerns and suggests specific tools for that evaluation, including EPA's EJScreen and the Washington State Department of Health Environmental Health Disparities Map.

EPA believes the Final EIS should include a more complete description of efforts to meaningfully engage with communities with environmental justice concerns and describe how those engagement efforts were used to develop the proposed project. EPA also asks for more information in the Air Quality analysis to address potential impacts on environmental justice communities.

EPA also suggested that Final EIS include more information on surface water quality and a discussion of the recent EPA-approved Water Quality Standards. The letter also asks for information regarding permitting.

EPA suggested coordinating with other agencies on specific topics, including the EPA Region 10 Superfund Program regarding the Midway Landfill Alternative and USFWS, NMFS, and WDFW regarding potential impacts to biological resources. EPA also recommends the Final EIS describes Tribal coordination and how issues have been addressed.

EPA recommends the Final EIS include more detail on monitoring construction of the project and the development of an adaptive management plan so that any necessary adjustments can be made to meet environmental objectives.

Finally, EPA asks that the Final EIS include an analysis of the social cost of greenhouse gas emissions.

Federal Highway Administration

FHWA’s comments focused on the language accessibility of public outreach and impacts concerning ecosystem and water resources; environmental justice; noise; acquisitions, displacements, and relocations; and transportation.

FHWA asked that the discussion on 6PPD-quinone be expanded to include more recent research on salmonid mortality. There were also comments asking for clarification in the Water Resources analysis concerning pollutant-generating impervious surfaces.

FHWA suggested specifying that there would be fewer noise impacts from the mainline because property acquisitions would increase the distance between sensitive receptors and the track would make the noise analysis more understandable to the reader.

Several comments were made on the Acquisitions, Displacements, and Relocation analysis, mostly relating to definition of terms.

Washington State Department of Transportation

WSDOT provided comments on stormwater, ecosystem resources, community impacts, and hazardous materials. WSDOT asked Sound Transit and FTA to inventory WSDOT-owned and managed facilities that could be affected by the project to ensure adequate mitigation is provided. WSDOT recommended that fish passage barriers be identified with Washington Department of Fish and Wildlife identification numbers and ownership and provided a link to WSDOT’s current 2030 fish passage delivery plans. Additionally, WSDOT asks how the 2019 Memorandum of Understanding between Sound Transit and Ecology concerning stormwater runoff from mainline tracks will apply to OMF South.

5.2.1.3 Local Jurisdictions

City of Federal Way

Federal Way provided comments on the 2023 NEPA Draft/SEPA Supplemental Draft EIS and resubmitted comments made on the 2021 SEPA Draft EIS, incorporating them by reference. Federal Way supports the selection of the Midway Landfill Alternative.

The city provided comments on impacts related to transportation; social resources, community facilities, and neighborhoods; economics; land use; visual and aesthetic resources; noise and vibration; ecosystems resources; and cumulative effects. Their comments focused mainly on transportation and land use. Under transportation, Federal Way believes that the analysis does not adequately analyze the Preferred and South 344th Street alternatives because not all proposed driveways and intersections were included in the analysis and some incorrect driveways were included. Federal Way notes that the city controls all intersections in the study area for the alternatives, including those along state routes, so the analysis should list volume/capacity ratios for all intersections. The city also expressed concern over the safety impacts of the project, noting that the South 344th Street Alternative does not include designs to replace the current bicycle and pedestrian path, which is present at the site.

Federal Way believes there is insufficient information to be able to make an informed decision regarding changes to existing land uses and vacating streets and that supplemental trip generation analysis and volume figures should be provided. Federal Way also asks about replacement parking due to impacts to the Federal Way/S 320th Street Park & Ride.

Federal Way had a number of comments concerning Appendix H2, Land Use Technical Appendix, disagreeing with some of the conclusions regarding zoning and comprehensive plan consistency.

5.2.2 Comments from Businesses and Community Groups

Sound Transit received one communication from a potentially affected business and community group, the GarageTown Condominium Association. The GarageTown Condominium Association continues to support development of the Midway Landfill for the OMF South and strongly opposes the South 344th Street Alternative.

The association commented on the proposed extension of 21st Avenue S with the Preferred Alternative. They are concerned that it would intrude onto the southeast corner of the GarageTown property, reducing the width of GarageTown’s eastern driveway and an emergency secondary access for fire equipment. The association also states that retaining the cul-de-sac at the eastern end of S 344th Street is unnecessary and undesirable, as it is a known site for illicit activity.

The GarageTown Condominium Association is strongly opposed to replacing the culvert under S 344th Street with a fish passable structure due to concern of potential damage to buildings if the existing culvert is excavated. They suggest rerouting the stream instead.

5.2.3 General Public Comments

During the OMF South Draft EIS comment period, Sound Transit received 52 communications (letters, emails, oral comments at public hearings, online comment form) from the general public.

Within the 52 communications there were approximately 139 individual comments, which are summarized in the following subsections. General or project-wide comment topics are described first, followed by comments about specific OMF South alternatives.

5.2.3.1 General or Project-Wide Comments

The most common general themes in the public comments, outside of statements for or against a particular alternative, concerned impacts to the community or neighborhood due to displacements of residents, businesses, and employees as well as impacts to natural resources such as streams, wetlands, and habitat. Six individuals submitted a comment letter that expresses opposition to the Federal Way alternatives and asks Sound Transit to reconsider other sites, particularly in Fife. The letter cites ecosystem concerns, and land use and zoning issues as reasons why the Federal Way sites should not be chosen.

5.2.3.2 Preferred Alternative

Of the 37 commenters who expressed support for a particular site, 10 supported the Preferred Alternative (one supported both the Preferred or South 344th Street alternative), citing the alternative’s proximity to SR 99 and the belief that the current uses on the site could be relocated in the area. Of the 22 commenters that expressed opposition to a particular site, 17 opposed the selection of the Preferred Alternative (nine expressed opposition to both the Preferred and South 344th Street alternatives). Most of these commenters feel that Federal Way has been disproportionately affected by Sound Transit projects.

5.2.3.3 South 344th Street Alternative

Of the 37 commenters who expressed support for a particular site, two supported the South 344th Street Alternative (one supported either the Preferred or South 344th Street alternative) because of its proximity to I-5. Of the 22 commenters who expressed opposition to a particular site, 11 opposed the selection of the South 344th Street Alternative, citing impacts to businesses and employment (nine expressed opposition to both the Preferred and South 344th Street alternatives).

5.2.3.4 Midway Landfill Alternative

Of the 37 commenters who expressed support for a particular site, 22 supported the Midway Landfill Alternative. Supporters cited the relative lack of impacts to businesses and natural resources. Of the 22 commenters who expressed opposition to a particular site, three opposed the selection of the Midway Landfill Alternative: one with no reason cited, the others expressing concern over construction at a Superfund site and the uncertainties around cost and schedule.

5.3 Responses to Common Comments

Sound Transit reviewed all comments submitted during both comment periods. Appendix L, Draft EIS Comments and Responses includes responses to each of the comments received during the comment periods. Many of the comments expressed similar themes, such as support for a particular alternative or concern about a specific issue. Table 5.3-1 provides responses to the most common comments. These responses are also referenced in Appendix L, using the common comment number found in the first column of the table.

Table 5.3-1 Responses to Common Comments

Number	Common Comment	Response
1	Sound Transit underestimated the impacts associated with business and employee displacements. The EIS should report an accurate number of employee displacements, or the total number of jobs gained or lost. Specifically, neither Ellenos Yogurt nor GarageTown could be easily relocated, and the impacts to those properties are not characterized adequately. GarageTown comprises multiple owners.	The number of displaced employees is based on the business building size (taken from King County Department of Assessment data) and the type of business activity using square-foot-per-employee factors from the U.S. Department of Energy and the Institute for Transportation Engineers. While not an actual survey of businesses, it allows an equal comparison between alternatives without having to access confidential or proprietary business information. The Final EIS does not calculate a net job gain or loss because relocation decisions are determined by individual business owners. Some displaced businesses may choose to relocate, while others may choose to permanently close when their property is purchased. As described in Section 3.3., Acquisitions, Displacements, and Relocations, Sound Transit provides relocation assistance to displaced businesses and, on past projects, has successfully helped many businesses that chose to relocate within the project area. To estimate the number of GarageTown owners, Sound Transit used GarageTown's website to count the number of displaced units. The Final EIS acknowledges that both Ellenos Yogurt and GarageTown are unique facilities that would be challenging to relocate. This is described in Section 3.3, Acquisitions, Displacements, and Relocations.
2	There would be too many residential displacements with either of the alternatives in Federal Way. Many of these displacements would affect lower income and/or elderly residents. Relocation of residents of Belmor Mobile Home Park is of particular concern.	The Preferred Alternative would displace up to 97 residences, mostly concentrated in the Belmor residential area. Section 3.3, Acquisitions, Displacements, and Relocations, describes the relocation benefits for displaced residents (both owners and tenants); it also provides specific information about relocation of mobile homes. Displacements from all alternatives would occur in areas with concentrations of minority and low-income populations. Appendix E, Environmental Justice Assessment, discusses how displacements would affect low-income and minority populations and how Sound Transit would provide advisory services to help find comparable housing for these residents. For properties that require relocation, Sound Transit's policies and procedures comply with the Federal Uniform Relocation Assistance and Real Property Acquisition Policies Act of 1970 (as amended) and Washington State's relocation and property acquisitions requirements. In some cases, Sound Transit provides advisory services to property owners above the minimum requirements of federal and state law. Sound Transit would compensate affected property owners in accordance with Sound Transit's Real Estate Property Acquisition and Relocation Policy, Procedures, and Guidelines (Sound Transit 2017). Benefits would depend on the level of impact, available relocation options, and other factors. Sound Transit would offer relocation assistance that includes compensation and supporting services that consider the needs of those being relocated to help reduce inconveniences or hardships. Sound Transit would also satisfy federal and state requirements for residential relocation, which define a "comparable replacement dwelling" as having the following attributes: • Decent, safe, and sanitary. • Adequate in size to accommodate the occupants. • Within the financial means of the displaced person. • Functionally equivalent.

Table 5.3-1 Response to Common Comments (continued)

Number	Common Comment	Response
		• In an area not subject to unreasonable adverse environmental conditions. • In a location generally not less desirable than the location of the displaced person's dwelling with respect to public utilities, facilities, services, and the displaced person's place of employment. To meet these requirements, Sound Transit may identify relocation properties that are in better condition and of higher value than the properties being acquired. If so, tenants may be eligible for a down payment or rent supplement.
3	Hylebos Creek and associated wetlands are important and need to be protected.	Section 3.10, Ecosystem Resources, of the Final EIS discusses the project's anticipated impacts (and proposed mitigation) to two tributaries to Hylebos Creek and associated wetlands. In addition, the Final EIS recognizes that the project would impact existing vegetation, including mature forested buffer areas. Impacts to the two tributaries to Hylebos Creek and wetlands have been avoided and minimized where possible during conceptual design. After publication of the 2021 SEPA Draft EIS, Sound Transit modified the design of the Preferred Alternative to reduce impacts to streams and wetlands. Further avoidance and minimization of wetland impacts would occur during future design and permitting of the project. Native vegetation would be restored in wetlands and buffers temporarily affected by construction. Sound Transit has committed to achieving no net loss of wetland function and area on a project-wide basis. As part of the Section 404 and Section 401 permitting process under the Clean Water Act, Sound Transit would work with Tribes and resource agencies to develop a mitigation approach. As part of this approach, Sound Transit would develop plans for compensatory mitigation for the effects of the project on wetlands, streams, and regulatory buffers on a watershed basis. Potential mitigation areas downstream of the preferred alternative would enhance and restore wetlands and streams that contribute to the overall health of salmonids in the West Fork Hylebos Creek drainage. To the extent possible, off-site compensatory mitigation sites would be identified and would compensate for lost values in kind.
4	Comments limited to expressing a preference or objection to one or more alternatives, including preferences or objections supported by non-substantive comments or analysis already provided in the EIS. In particular, many commenters expressed a preference for the Midway Landfill Alternative based on the following reasons: • Large, mostly vacant site • Relatively few natural environment impacts • Relatively few business displacements • No residential displacements	Sound Transit reviewed all comments submitted during the 2021 SEPA Draft EIS and 2023 NEPA Draft/SEPA Supplemental Draft EIS comment periods. NEPA and SEPA require Sound Transit to respond to substantive comments related to the content of the Draft EIS, but not to questions or comments limited to public policy decisions (e.g., general statements of support or opposition). Before identifying the Preferred Alternative, the Sound Transit Board received a comment summary report that included a copy of all comments submitted on the 2021 SEPA Draft EIS in November 2021. Appendix L of the Final EIS includes copies of the comments and responses to substantive comments made on both the 2021 SEPA Draft EIS and the 2023 NEPA Draft/SEPA Supplemental Draft EIS. The Midway Landfill Alternative was initially identified for study largely due to attributes that many commenters found appealing. While the Board did not identify the Midway Landfill Alternative as the Preferred Alternative for evaluation in the Final EIS, it is being carried forward as an alternative for consideration. After considering the Draft EIS comments, analysis in the Final EIS, and other factors, the Sound Transit Board will select the project to be built.

Table 5.3-1 Response to Common Comments (continued)

Number	Common Comment	Response
	- Brownfield redevelopment potential Commenters opposed the South 344th Street Alternative based on the following reasons: - Greatest number of business and employee displacements - Impacts to GarageTown and Ellenos Yogurt - Ecosystem impacts - Residential displacements due to the mainline alignment Reasons commenters gave for opposing the Preferred Alternative included: - Ecosystem impacts - Displacement of Christian Faith Center - Residential displacements due to the mainline alignment	
5	Sound Transit should identify sources of federal funding for the project. Specifically, there are funds related to Superfund site redevelopment that could lower the costs of developing the Midway Landfill Alternative.	Sound Transit executed a grant agreement with the FTA in December 2023 for $4.9M in 5307 funds for OMF South. Sound Transit will continue pursuing applicable federal funding sources to help fund the project including, but not limited to FTA's Capital Investments Grants programs (e.g., Expedited Project Delivery, Full Funding Grant Agreement), a U.S. DOT Build America Bureau Transportation Infrastructure Finance and Innovation Agreement (TIFIA) loan, and other federal sources such as EPA programs (e.g., Brownfields and Climate Pollution Reduction).

Appendix A3 – Glossary

Air pollutant. Smoke, dust, fumes, or odors in the ambient air that have the potential for harmful effects.

Alignment. Horizontal geometric elements, which define the location of the light rail track or roadway.

Aquatic resource. The physical elements of the aquatic environment, such as streams, rivers, lakes, and shorelands; as well as life forms such as aquatic plants and fish that live within the aquatic environment.

Aquifer. An underground layer of water-bearing permeable rock or unconsolidated materials (gravel, sand, or silt) from which groundwater can be extracted using a water well.

Arterial. A major thoroughfare used mainly for through traffic rather than access to adjacent property. Arterials generally have greater traffic-carrying capacity than collector or local streets and are designed for continuously moving traffic.

At-grade. Term used to express that a feature, such as a rail track or crosswalk, and a roadway meet at the same elevation.

Attainment area. An attainment area is an area considered to have air quality as good as or better than the national ambient air quality standards for specific pollutants as defined in the Clean Air Act.

A-weighted sound level (dBA). To approximate the way humans interpret sound, a filter circuit with frequency characteristics similar to the human hearing system is built into sound measurement equipment. Measurements with this filter enacted are referred to as A-weighted sound levels, expressed in dBA (see Decibel).

Ballast. Gravel or coarse stone used to form the bed of a railroad track or road.

Best management practices (BMPs). Approved physical, structural, and/or managerial practices that, when used singularly or in combination, prevent or reduce pollutant discharges.

Buffer. An area adjacent a critical area (e.g., wetland or stream) that functions to avoid loss or decline in ecological functions and values. In addition to preserving the ecological functions of a wetland system, a buffer physically isolates a critical area from potential disturbance and harmful intrusion, and works to minimize risk to the public from loss of life, well-being, or property damage.

Capacity, vehicle. The maximum number of vehicles that can be accommodated in a given time by a transit or highway facility.

Capital costs. Nonrecurring costs required to construct transit systems, including costs of right-of- way, facilities, rolling stock, power distribution, and the associated administrative and design costs, as well as financing charges during construction.

Carbon monoxide (CO). A colorless, odorless, tasteless gas, and one of the U.S. Environmental Protection Agency's criteria air pollutants released from automobile exhaust.

Census tract. A census tract is a small subdivision of an urban area used by the U.S. Census Bureau to identify population and housing statistics. Census blocks are subdivisions of census tracts and are the smallest unit of census geography for which the Census Bureau collects data. The boundaries of census blocks are generally streets or other notable physical features and often correspond to a city block. A census block group is a combination of census blocks, typically encompassing two to four city blocks.

The U.S. Census collects some information at the block level, some at the block group level, and some at the tract level.

Concentration (also, level). A measure of the air pollutant in the ambient air, having the units of mass per volume.

Conformity (air quality). A process that ensures federal funding and approval goes to transportation activities consistent with federal air quality goals. The Federal Highway Administration and the Federal Transit Administration jointly determine that specific regions meet air quality standards.

Construction staging area. During construction, a site temporarily used for materials or equipment storage, assembly, or other temporary, construction-related activities.

Criteria air pollutants. Those air pollutants that have been recognized by the U.S. Environmental Protection Agency as potentially harmful and for which standards have been set to protect the public health and welfare. The criteria air pollutants are carbon monoxide, sulfur dioxide, particulates, nitrogen dioxide, ozone, hydrocarbons, and lead.

Day night sound level (Ldn). Ldn is a 24-hour equivalent continuous sound level (Leq), but with a 10-dB penalty assessed to noise events occurring at night. Nighttime is defined as 10 pm to 7 am. This strongly weights Ldn toward nighttime noise because most people are more easily annoyed by noise during the nighttime hours when background noise is lower and most people are sleeping.

dBA. The sound level obtained through the use of A-weighting characteristics specified by the American National Standards Institute (ANSI) Standard S1.4-1971. The unit of measure is the decibel (dB), commonly referred to as dBA when A-weighting is used. The “A” weighting scale closely resembles human response to noise.

Decibel. The unit used to measure the loudness of noise.

De minimis. De minimis is a Latin phrase meaning something of insignificance or negligible. De minimis impacts are defined as those elements that do not adversely affect the activities, features, and attributes of a Section 4(f) resource or property.

Dewatering. The temporary removal of ground or surface water from a construction area to allow construction to be done under dry conditions.

Displacement. A property acquisition that would require removing an existing use.

Elevated mainline. A mainline that is positioned above the normal activity level (e.g., elevated structure for light rail to cross over a street).

Emission. Particulate, gaseous, noise, or electromagnetic byproducts of the transit system or vehicle.

Endangered species. According to the Endangered Species Act of 1973, an endangered species is any species in danger of extinction throughout all or a significant portion of its range, other than an insect determined by the Secretary of the Interior to constitute a pest whose protection under the provisions of this act would present an overwhelming and overriding risk to man.

Equivalent level (Leq). Leq is a measure of sound energy over a period of time. It is referred to as the equivalent sound level because it is equivalent to the level of a steady sound which, over a referenced duration and location, has the same A-weighted sound (dBA) energy as the fluctuating sound.

Forest habitat. In the Puget Sound lowlands, a habitat type generally dominated by Douglas fir, western red cedar, and western hemlock, frequently with a hardwood understory. The ground cover is generally lush. Birds and small mammals abound, and larger mammals are common in large stands.

Full acquisition. The full parcel would be acquired, and the current use would be displaced. Full acquisitions include parcels that might not be fully needed for the project but would be affected to the extent that current uses would be substantially impaired (e.g., loss of parking or access).

Glacial till. This type of soil typically consists of a diverse mix of gravelly sand with scattered cobbles and boulders in a clay/silt matrix. It is very dense and is locally referred to as “hardpan.” The predominant glacial till encountered in the project area is Vashon-age glacial till.

Grade separated. Parallel or crossing lines of traffic that are vertically or horizontally physically separated from each other and do not share a common intersection.

Greenhouse gas (GHG). Greenhouse gases include carbon dioxide (CO_2), methane (CH_4), ozone (O_3), water vapor, nitrous oxide (N_2O), hydrofluorocarbons (HFCs), and perfluorocarbons. (PFCs), and sulfur hexafluoride (SF6). These gas emissions are collectively leading to the greenhouse effect, trapping the sun’s solar rays and leading to an increase in Earth temperature.

Groundborne noise. Noise that is transmitted through the ground, typically reported in decibels.

Groundborne vibration. A small but rapidly fluctuating motion transmitted through the ground, typically reported as velocity or acceleration.

Habitat function. Terrestrial plant communities, wetlands, and aquatic systems such as streams provide a variety of functions in the environment. For instance, depending on the condition and location of a wetland, wetland functions might include water quality improvement, groundwater recharge, nutrient and sediment filtering, and habitat for a variety of animals, as well as education and recreation opportunities for people—the habitat function is one of several functions potentially performed by wetlands. Similarly, terrestrial and aquatic systems each also may perform many functions. When they provide habitat for animals, they are said to be performing or providing a “habitat function.”

Habitat value. The value of a plant community’s function as determined by the habitat’s ability to support the needs of biological species. High-value habitats are those that support or may support threatened, endangered, and/or sensitive species as determined by federal, state, and local jurisdictions.

Hazardous materials. Hazardous materials are materials, which, because of their chemical, physical, or biological nature, pose a potential risk to life, health, or property when released. Such materials include hazardous waste, dangerous waste, hazardous substances, and toxic substances.

Headway. The headway between vehicles in public transit systems is the amount of time (usually in minutes) that elapses between two vehicles passing the same point traveling in the same direction on a given route.

High-capacity transit. A system of public transportation services within an urbanized region operating principally on exclusive rights-of-way; examples include light rail transit or express buses on exclusive bus ways and their supporting services.

Hours of service. The number of hours during the day between the start and end of service on a transit route, also known as the service span.

Lead Track. A track connecting a railroad yard or facility with a mainline track.

Ldn. The day/night average noise level.

Leq. The equivalent steady-state sound level that, in a specified time period, would contain the same acoustic energy as the varying sound level during the same period; considers volume capacity, travel speeds, and delay.

Leq(h). The hourly value of Leq**.**

Level of service (LOS). A qualitative measure that represents the collective factors of travel under a particular volume condition. A measure of traffic congestion.

Light rail transit (also light rail). A mode of mass transportation comprising light rail vehicles, which travel on steel tracks and are powered by electricity from overhead wires. This mode is characterized by its ability to operate in at-grade and/or grade-separated environments.

Link. Sound Transit’s light rail system.

Low income. A person whose median household income is at or below the U.S. Department of Health and Human Services poverty guidelines.

Low income population. Any readily identifiable group of low-income persons who live in geographic proximity, and, if circumstances warrant, geographically dispersed/transient persons (such as migrant workers or Native Americans) who will be similarly affected by the project.

Mainline. Track that is used for LRVs or is the principal artery of a system to which other components (such as operation and maintenance facilities) are connected (see Elevated Mainline).

Maintenance area. Maintenance areas are geographic areas with a history of nonattainment of National Ambient Air Quality Standards (NAAQS), but they now consistently meet NAAQS.

Megawatt (MW). 1,000,000 watts.

Minority. A person who is:

- Black - A person having origins in any of the black racial groups of Africa;
- Hispanic or Latino - A person of Mexican, Puerto Rican, Cuban, Central or South American, or other Spanish culture or origin, regardless of race;
- Asian - A person having origins in any of the original peoples of the Far East, Southeast Asia, or the Indian subcontinent;
- American Indian or Alaskan Native - A person having origins in any of the original people of North or South America, including Central America, and who maintains cultural identification through tribal affiliation or community recognition; or
- Native Hawaiian or Other Pacific Islander - A person having origins in any of the original peoples of Hawaii, Guam, Samoa, or other Pacific Islands.

Minority population. Any readily identifiable groups of minority persons who live in geographic proximity, and if circumstances warrant, geographically dispersed/transient persons (such as migrant workers or Native Americans) who will be similarly affected by the project.

Mobility. The ease of continuous movement along the transportation system.

Mode. A particular form or method of travel, such as pedestrian, bicycle, automobile, bus, or light rail.

Model Toxics Control Act (MTCA). The Model Toxics Control Act Cleanup Regulation, WAC 173-340, implements the Model Toxics Control Act, RCW 70.105D, which addresses strict requirements for site discovery and reporting, site assessments, and site remediation. Most important, the regulation defines standard methods used to assess whether a site is contaminated or clean.

National Ambient Air Quality Standards (NAAQS). Federal limits on levels of atmospheric contamination necessary to protect the public from adverse effects on health (primary standards) and welfare (secondary standards).

National Historic Preservation Act of 1966 (NHRA). The Act that established the National Register of Historic Places and State Historic Preservation program and set forth guidelines and regulations for environmental review of projects involving federal funding.

National Register of Historic Places (NRHP). The official list of the nation’s cultural resources determined to be worthy of preservation; the register is maintained by the National Park Service.

Network. A system of real or hypothetical interconnecting links that forms the configuration of transit routes and stops comprising the total system.

Nonattainment area. An area designated by the U.S. Environmental Protection Agency as currently violating the National Ambient Air Quality Standards, based on archival air quality data.

NO_X. Oxides of nitrogen (nitrogen oxide and nitrogen dioxide). The pollutants released during high-temperature combustion of fossil fuels such as diesel.

Off-peak. Those periods of the day when demand for transit service is not at a maximum.

Operating costs. Recurring costs incurred in operating transit systems, including wages and salaries, maintenance of facilities and equipment, fuel, supplies, employee benefits, insurance, taxes, and other administrative costs. Amortization of facilities and equipment is not included.

Ozone. A gas consisting of three oxygen atoms formed in reactions of nonmethane hydrocarbons and nitrogen oxides in the presence of sunlight. Ozone is one of the U.S. Environmental Protection Agency's criteria air pollutants.

Partial acquisition. Part of a parcel would be acquired, but the current use generally would not be displaced. In some instances, such as larger parcels that hold multiple uses, a business or residential unit on a parcel could be displaced, but most uses would remain.

Particulate matter. A mixture of extremely small particles and liquid droplets that is made up of a number of components, including acids (such as nitrates and sulfates), organic chemicals, metals, and soil or dust particles. U.S. Environmental Protection Agency is concerned about particles that are 10 micrometers in diameter or smaller because those are the particles that generally pass through the throat and nose and enter the lungs.

Peak hour. The hour of the day in which the maximum demand for service is experienced, accommodating the largest number of automobile or transit patrons.

Peak period. A time period or periods when travel activity is at its heaviest.

Pollution-Generating Impervious Surface (PGIS). Impervious surfaces considered to be a significant source of pollutants in stormwater runoff. Such surfaces include those subject to vehicular use, industrial activities (as defined in Washington State Department of Ecology's Stormwater Management Manual), or storage of erodible or leachable materials, wastes, or chemicals, and which receive direct rainfall or the run-on or blow-in of rainfall.

Preferred alternative. Following publication of the Draft EIS, the Sound Transit Board identifies a preferred alternative, including route and station options. The Final EIS will further evaluate the preferred alternative as well as other alternatives. A preferred alternative is not an action or decision within the meaning of WAC 197-11-070.

Recessional outwash. Sediment deposited by meltwater streams flowing away from a retreating glacier during the last episode of glaciation.

Reliability. How often transit service is provided as promised; affects waiting time, consistency of passenger arrivals from day to day, total trip time, and loading levels.

Right-of-way. The corridor (horizontal and vertical space) owned by the transit agency for the transportation way.

Riparian habitat. A habitat type associated with stream or river margins and characterized by dense vegetation consisting primarily of willow, alder, and cottonwood species, supporting a wide variety of waterfowl, songbirds, amphibians, and small mammals.

Runoff. The rainwater that directly leaves an area in surface drainage, as opposed to the amount that seeps out as groundwater.

Section 106. Section 106 of the National Historic Preservation Act of 1966 established a procedure to review the potential effects on cultural resources by projects that involve a federal action.

Section 4(f). Section 4(f) of the U.S. Department of Transportation Act restricts the United States Department of Transportation's approval of projects affecting the following properties: publicly owned land from a public park, recreation area, or wildlife and waterfowl refuge, or any land from a significant historic site.

Section 401. Section 401 of the Clean Water Act is a certification program administered by the Washington Department of Ecology under guidelines of the U.S. Environmental Protection Agency to ensure projects applying for a Section 404 permit comply with state water quality standards and other requirements of the state law.

Section 404. Section 404 of the Clean Water Act is a permit program administered by the U.S. Army Corps of Engineers under guidelines by the U.S. Environmental Protection Agency to protect the nation's waters from dredged and fill sources.

Section 6(f). Section 6(f) of the Land and Water Conservation Act of 1965 established restrictions on, and replacement requirements for, the use of land acquired with funds authorized under the Land and Water Conservation Fund Act.

Sensitive receptor (Auditory). A local area or site that supports activities easily disrupted by audio intrusions or distractions, such as a school, historic landmark, or residential neighborhood.

Sensitive view. A view that is identified by local jurisdictions as requiring protection.

Social interaction. Intra-neighborhood communication and circulation using street, sidewalk, and bikeway connections between residential areas and community facilities, retail businesses, and employment centers. Also includes verbal interaction and telecommunications facilities.

Sound Transit 2 (ST 2). A package of high-capacity transit investments in the regional transit system, adopted by the Sound Transit Board in July 2008, which included light rail as the mode choice for the project corridor. ST 2 includes a major expansion of the Link light rail system. ST 2 would extend light rail from North Seattle into Snohomish County, across Lake Washington into East King County, and south of SeaTac International Airport to Federal Way.

Sound Transit 3 (ST 3). Sound Transit 3, for which financing was approved by voters in 2016, includes the expansion of bus, bus rapid transit, commuter rail, and light rail service throughout the region. Under Sound Transit 3, the light rail system in central Puget Sound would grow to 116 miles with over 80 stations. Light rail would expand north to Everett, south to Federal Way and Tacoma, east to Redmond, south Kirkland, and Issaquah, and west to West Seattle and Ballard.

Staging area. Section of land near a construction site designated for equipment and truck storage, maintenance, and warm-up prior to engagement in construction activities.

Stormwater. Stormwater is rain and snow melt that runs off surfaces such as rooftops, paved streets, highways, and parking lots. As water runs off these surfaces, it can pick up pollution.

Stormwater detention. The temporary storage of stormwater runoff and subsequent release at a slower rate.

Stormwater treatment. Stormwater ponds and underground vaults are used to remove sediments and dissolved metals from stormwater. They collect sediments on the bottom of the pond or vault, where maintenance workers can clean them out on a regular basis.

Subduction zone. An area where one crustal plate is descending below another. The Puget Sound area is close to a subduction zone, which is formed by the Juan de Fuca plate descending below the North American plate. This action can cause significant seismic activity.

Threatened species. According to the Endangered Species Act of 1973, any species that is likely to become an endangered species within the foreseeable future throughout all or a significant portion of its range.

Till. A poorly sorted, gravel-like deposit of sediment that is left behind by a glacier, which does not show stratification. Till is sometimes called boulder clay because it is composed of clay, boulders of intermediate sizes, or a mixture of these.

Transit. A transportation system principally for moving people in an urban area and made available to the public usually through paying a fare.

Transit center. A station with shelters where a large number of transit vehicles and passengers can be brought together with safety and convenience.

Transit-oriented development. The Transportation Research Board provides several definitions of transit-oriented development that emphasize high-quality walking environments, mixed land uses, and high-density developments linked to transit. Generally, transit agencies agree that what constitutes a transit-oriented development is a pattern of dense, diverse, pedestrian-friendly land uses near transit nodes that, under the right conditions, translates into higher transit patronage.

Travel time (in vehicle). The time required to travel between two points, not including terminal or waiting time.

Trip. The one-way movement of one person between the origin and the destination, including transfers, and the walk distance to and from the means of transportation.

Unity. In visual analysis, the visual coherence and compositional harmony of the landscape.

Use of Section 4(f) land. According to regulations of the U.S. Department of Transportation, use of Section 4(f) land is defined as: (1) acquisition of title or easement to land, or (2) in unusual circumstances, serious indirect impacts, such as increase in noise, visual intrusion, or access obstruction.

Vehicle hours of travel (VHT). The total vehicle hours expended traveling on the roadway network in a specified area during a specified time period.

Vibration velocity. Vibration velocity is the basic measure of groundborne vibration. It is a measure of the rate at which particles in the ground are oscillating relative to the equilibrium point.

Vibration velocity level. It is generally accepted that, over the frequency range important for groundborne vibration from transit systems, human response to vibration is best correlated to the root mean square (rms) vibration velocity.

Viewer sensitivity. The extent of the viewer’s concern for a particular view or viewshed. Viewer sensitivity to the viewed environment is classified as low, average, or high.

View. A scene observed from a given vantage point.

Viewshed. An area of land, water, or other environmental element that is visible to the human eye from a fixed vantage point.

Visual character. Refers to identifiable visual information, including visual elements and major environmental features.

Visual quality. Refers to the evaluation of the visual experience to the public and is described in terms of vividness, intactness, and unity. *Vividness* refers to the way landscape components combine in distinctive and memorable visual patterns. *Intactness* refers to whether the natural and human-built visual patterns form a consistent landscape, or whether highly contrasting features intrude into the view. *Unity* refers to the visual coherence and compositional harmony of the landscape considered as a whole. Visual quality is an assessment of the visual character and is categorized as low, medium, or high, as follows:

Low visual quality. Views that lack a dominant visual character in which there is a low level of fit between disparate elements. In some cases, these views appear disorganized with features that seem out of place, or are views with some compositional harmony but include eyesore elements that can dominate one’s perception.

Medium visual quality. Views with a unity or compositional harmony between elements of the landscape that produce a pleasing overall impression in which encroaching elements are minor and do not substantially alter the perception of the landscape as a unit. These views lack vivid, memorable features and are generally characterized as common or ordinary.

High visual quality. Views with vivid, memorable, distinctive features in a landscape with compositional harmony or that fit between elements of the landscape that is free from encroaching elements.

Washington State Department of Ecology 303(d) List. The federal Clean Water Act (CWA), adopted in 1972, requires states to restore their waters to be “fishable and swimmable.” The CWA established a process to identify and clean up polluted waters. Every 2 years, all states are required to prepare a list of water bodies that do not meet water quality standards. This list is called the 303(d) list because the process is described in Section 303(d) of the CWA.

Acronyms and Abbreviations

APE	Area of Potential Effect
Belmor	Belmor Mobile Home Park
BPA	Bonneville Power Administration
Corps	United States Army Corps of Engineers
DAHP	Washington State Department of Archaeology and Historic Preservation
Ecology	Washington State Department of Ecology
EIS	Environmental Impact Statement
ELG	Elected Leadership Group
EO	Executive Order
EPA	Environmental Protection Agency
FHWA	Federal Highway Administration
FTA	Federal Transit Administration
IAG	Interagency Group
NEPA	National Environmental Policy Act
OMF	operations and maintenance facility
Puyallup Tribe of Indians	Puyallup Tribe of the Puyallup Reservation
Q&A	questions and answers
SEPA	Washington State Environmental Policy Act
SPU	Seattle Public Utilities
TDLE	Tacoma Dome Link Extension
WDFW	Washington Department of Fish and Wildlife
WISAARD	Washington Information System for Architectural and Archaeological Records Data
WSDOT	Washington State Department of Transportation
“X”	company formerly known as Twitter

APPENDIX B PUBLIC INVOLVEMENT AND AGENCY COORDINATION

The National Environmental Policy Act (NEPA) and the Washington State Environmental Policy Act (SEPA) emphasize the importance of public engagement and agency involvement as key factors in the environmental review process. Sound Transit is committed to engaging interested parties early and often during the development of Operations and Maintenance Facility (OMF) South. Sound Transit has engaged neighborhood and community stakeholders, Tribes, state and federal agencies, transit partners, and the general public leading into and during development of the 2021 SEPA Draft Environmental Impact Statement (EIS), the 2023 NEPA Draft/SEPA Supplemental Draft EIS, and the NEPA/SEPA Final EIS published in 2024.

This appendix summarizes Sound Transit’s Tribal and agency coordination and public outreach activities to date through the environmental review process for the OMF South project. Sound Transit worked with federal, state, and local agencies, Tribes, and local jurisdictions to create an open and collaborative process that provided numerous opportunities to inform and involve the public.

1 OUTREACH GOALS AND OBJECTIVES

The OMF South is part of the mass transit system expansion by Sound Transit, funded by the Sound Transit 3 initiative approved by voters in 2016. Public participation and input played a critical role in identifying a variety of potential locations and narrowing those to the three alternatives for study in the EIS. To meet the project timeline and goals, Sound Transit engaged the public through an intensive public involvement process.

Throughout alternatives development and environmental review, Sound Transit commits to several goals to ensure successful engagement, including:

- **Proactively engaging audiences and communities** most affected by the project in conversations that would lead to identifying a project to be built.
- **Transparent, meaningful, and inclusive communication** that is clear and timely.
- **Sharing information in a variety of ways** to encourage awareness of project progress and its benefits.
- **Clear communication of how feedback informed project decisions** to ensure accountability.
- **Accessible project information** geared toward accessibility for all audiences, with easy-to-read, understandable, and in-language materials.

Sound Transit focuses outreach toward five key audience groups:

- **Tribes, agencies, and local jurisdictions** through the establishment of an Elected Leadership Group (ELG) and an Interagency Group (IAG) that met regularly to provide input and receive project updates.
- **Neighborhood and community stakeholders**, including advocacy groups, businesses, communities of color, community-based organizations and cultural groups, current and future transit riders, immigrant and refugee populations, limited-English-speaking populations, low-income households, people with disabilities, local residents (renters and homeowners), and social service organizations.

- **Property owners**, including homeowners, condominium owners, apartment complex owners and their tenants and staff, small and minority-owned businesses, and commercial property owners and their tenants.
- **Public**, including people who live, work, and commute in, through, and around the Puget Sound region.
- **Print, digital, and broadcast media**, including community, local, and ethnic resources.

Sound Transit combines **in-person, online, and existing community engagement strategies** to continue to reach and engage as many members of the public as possible. English and translated materials have been available throughout the project.

2 CHARTERED GROUP ENGAGEMENT

2.1 Lead Agencies

The Federal Transit Administration (FTA) is acting as the NEPA lead agency with Sound Transit acting as the SEPA lead agency.

2.2 Cooperating Agencies

Cooperating agencies include:

- Federal Highway Administration (FHWA)
- U.S. Army Corps of Engineers (Corps)
- U.S. Environmental Protection Agency (EPA)
- Washington State Department of Transportation (WSDOT)
- City of Federal Way
- City of Kent

2.3 Tribal and Agency Coordination

Sound Transit has engaged with project partners, local jurisdictions, affected Tribes, elected officials, community partners, stakeholders, and partner agencies since the project's beginning. Coordination with agencies and other stakeholders has been primarily through regular meetings with the following two chartered groups.

The ELG was convened starting in February 2018 to provide feedback and recommendations on project alternatives for the Tacoma Dome Link Extension (TDLE) project. The group was composed of elected officials representing the Puyallup Tribe of the Puyallup Reservation (Puyallup Tribe of Indians); the mayors of Federal Way, Milton, Fife, and Tacoma; Sound Transit Board members; and WSDOT. Staff provided OMF South updates to the ELG to keep them informed on the project; however, they were not tasked with making official recommendations due to the technical nature of decisions to site the facility. After Sound Transit identified that OMF South would need to be in south King County to meet operational criteria, limiting the geographic scope north of Pierce County, the Kent mayor was invited to attend all ELG meetings where OMF South updates were discussed beginning in fall of 2018.

Initially, the ELG met approximately every other month and then received updates approximately quarterly during the initial engineering design work and preparation of the 2021 SEPA Draft EIS. A list of meetings is outlined below in Table B.2-1. After the ELG made its recommendations for TDLE in 2019, the group's purpose was achieved. On March 5, 2021, Sound Transit invited the elected officials that composed the ELG to a briefing to provide an overview of findings from the 2021 SEPA Draft EIS and a preview of engagement opportunities during the 45-day comment period. The project team will keep the members of the former ELG informed on major project milestones moving forward, but the group is no longer being convened. ELG meeting dates are listed in Table B.2-1.

Table B.2-1 ELG Meeting Dates

ELG Meeting	Date
1	February 16, 2018
2	March 19, 2018
3	May 18, 2018
4	July 13, 2018
5	October 12, 2018
6	November 30, 2018
7	February 22, 2019
8	May 31, 2019
9	June 14, 2019

Sound Transit is working closely to coordinate with agencies and governments as this project moves forward at a technical level to ensure the project aligns with other city, agency, and Tribal plans and interests. The OMF South IAG is made up of representatives from the Puyallup Tribe of Indians, Muckleshoot Indian Tribe, cities of Federal Way, Kent, and Seattle; Seattle Public Utilities (SPU); Bonneville Power Administration (BPA); FHWA; WSDOT; EPA; Department of Ecology (Ecology); and King County.

The IAG reviewed and commented on the Methodology Memorandums prepared for each element of the environment included in the 2021 SEPA Draft EIS. A list of meetings is outlined below in Table B.2-2. The IAG was kept apprised of development of the site design and the study area used in the environmental analysis as well as the document status. In 2022, the meeting schedule was changed from monthly to quarterly.

Table B.2-2 IAG Meeting Dates

IAG Meeting	Date

2.3.1 Specific Agency Input during Development of Environmental Impact Statement Alternatives

Sound Transit has weighed the input of other agencies during the development of the alternatives considered for study in the EIS. In addition, Sound Transit has initiated discussions on a number of specific issues related to the project. Table B.2-3 lists the coordination meetings that have taken place thus far.

Table B.2-3 OMF South Agency and Local Jurisdiction Coordination Meetings

Agency/Local Jurisdiction	Purpose	Dates
SPU, WSDOT, Federal Way, Kent, Seattle	Midway Landfill workshops	**2019** August 13 October 3

Puyallup Tribe of Indians	Preferred Alternative Culvert and Stream Design	August 30, 2023
Muckleshoot Indian Tribe	Ecosystem Impacts	January 23, 2020

2.3.1.1 Midway Landfill

Public interest in pursuing the Midway Landfill as a potential OMF South site was raised early in the scoping process. The property is a mostly vacant site in an appropriate location within the Link system (South Corridor and adjacent to mainline tracks that will be operational when the facility opens); it is publicly owned and operated by SPU; and it would provide an opportunity to put a cleanup site back into productive use.

During development of the 2021 SEPA Draft EIS, Sound Transit hosted two landfill settlement workshops. Attendees included SPU, WSDOT, Federal Way, Kent, Seattle, and their consultant teams. The workshops centered on analyzing and brainstorming settlement solutions for a potential OMF South on the Midway Landfill. The results of the workshop were then presented to the entire IAG at the meeting on February 11, 2020. Sound Transit also met specifically with representatives of Seattle and SPU to discuss the Midway Landfill and to coordinate investigative field work, particularly geotechnical borings.

Sound Transit also met with Seattle, SPU, Ecology, and EPA to gain further understanding of the constraints that would be faced when working on a Superfund site with an approved cleanup action plan and a regulatory path forward if the Midway Landfill were ultimately selected as the final site for the OMF South.

2.3.1.2 Local Jurisdiction Coordination

On an ongoing basis, Sound Transit has met with Kent and Federal Way to coordinate alternatives development to gain understanding of local land use, permitting and other perspectives. These meetings were approximately monthly.

Once the Preferred Alternative was identified, Federal Way and Sound Transit staff set regular meetings every first, third, and fourth week of the month to discuss the project. The regular meetings with Kent have since ended.

2.3.1.3 Coordination Regarding NEPA

During preparation of the 2021 SEPA Draft EIS, Sound Transit coordinated with FHWA and WSDOT to identify the approach for NEPA compliance in support of future federal approvals for the project. Each build alternative would require work within the interstate/federal right-of-way, which would require approvals from FHWA. Due to this federal nexus, NEPA documentation will be prepared.

After publication of the 2021 SEPA Draft EIS, Sound Transit identified federal funding opportunities with FTA. Due to this, FTA was identified as the lead federal agency, and they determined that an EIS under NEPA would also be required.

Sound Transit and FTA met with EPA in November 2023 and March 2024 to discuss EPA’s comments on the Draft EIS related to environmental justice. EPA’s Draft EIS comment letter identified concerns about the conclusions made in the Draft EIS regarding environmental justice impacts. In the meetings, EPA explained that their approach for assessing disproportionate impacts to environmental justice populations focuses on evaluation of project impacts to overburdened communities that may experience environmental harm due to cumulative impacts.

While FTA evaluates project impacts to environmental justice populations, they also consider offsetting benefits and mitigation when assessing disproportionate impacts. This is consistent with DOT Order 5610.C, U.S. Department of Transportation Actions to Address

Environmental Justice in Minority Populations and Low-Income Populations,[1] which states, “In making determinations regarding disproportionately high and adverse effects on minority and low-income populations, mitigation and enhancement measures that will be implemented and all offsetting benefits to the affected minority and low-income populations may be taken into account, as well as the design, comparative impacts, and the relevant number of similar existing system elements in non-minority and non-low-income areas.”

Consideration of offsetting benefits and mitigation is also consistent with FTA’s policy guidance in Circular C-4703.1, Environmental Justice Policy Guidance for Federal Transit Administration Recipients, that states “Many public transportation projects involve both adverse effects such as short-term construction impacts, increases in bus traffic, etc., and positive benefits such as increased transportation options, improved connectivity, or overall improvement in air quality. Whether adverse effects will be disproportionately high is dependent on the net results after consideration of the totality of the circumstances.”

In response to EPA’s comments, FTA clarified the environmental justice assessment methodology; conducted additional direct impact analysis, including additional cumulative impact analysis using EPA’s EJScreen tool; provided a more detailed description of the project benefits and mitigation; and provided additional documentation of meaningful engagement. In the March 2024 meeting, FTA presented the additional analysis and information to EPA, who acknowledged that the additional actions and updates met the general intent of their comments. However, due to differences between EPA’s suggested approach for making a disproportionate and adverse effects determination and FTA’s established methodology, the agencies were unable to reach agreement on the conclusions of the environmental justice assessment. Pursuant to 23 CFR 771.125(a)(2), every reasonable effort and consultation have been made to attempt to resolve the interagency disagreement with regards to the determination of disproportionate and adverse effects on the EJ population.

2.3.1.4 Coordination Regarding Modification to BPA lines

Sound Transit met with representatives of BPA to discuss the proposed modification to the BPA transmission lines, particularly in regard to BPA’s environmental review process and potential Section 106 compliance. Sound Transit will continue to coordinate with BPA as the project progresses.

2.3.1.5 Coordination Regarding Possible Future Environmental Permits

Sound Transit met with representatives from the Corps, the Muckleshoot Indian Tribe, the Washington Department of Fish and Wildlife (WDFW), and Ecology for a preapplication meeting. The purpose of the meeting was to introduce the project, discuss the three alternative sites and the potential impacts of the Preferred Alternative, and discuss potential permitting under Section 404 of the Clean Water Act, should the Preferred Alternative be selected. The Puyallup Tribe of Indians was invited to the preapplication meeting but was unable to attend. A follow-up call with the Corps was held in May 2021 to discuss the NEPA process and federal requirements for the Section 404(b)(1) Alternative Analysis. A second preapplication meeting with the Corps to provide an update on the three alternative sites and the potential impact of the Preferred Alternative occurred on July 27, 2023, with both the Muckleshoot Tribe and Puyallup Tribe of Indians in attendance. A site visit with the Corps was conducted in December 2023, and a follow-up meeting was held to discuss the federal requirements for the Section 404(b)(1) Alternative Analysis.

---

[1] Executive Order (EO) 14096, Revitalizing Our Nation’s Commitment to Environmental Justice for All, was enacted on April 21, 2023. EO 14096 on environmental justice does not rescind EO 12898, Federal Actions to Address Environmental Justice in Minority Populations and Low-Income Populations, which has been in effect since February 11, 1994, and is currently implemented through DOT Order 5610.2C. This implementation will continue until further guidance is provided regarding the implementation of the new EO 14096 on environmental justice.

Sound Transit conducted a site visit with WDFW to the South 336th Street site to discuss design concepts and potential impacts to streams and wetlands for the Preferred Alternative. In addition, the requirements for permitting geotechnical borings were discussed. Washington Department of Ecology staff were contacted via email in December 2022 regarding stormwater ponds on the Preferred Alternative site. In July 2023, Sound Transit conducted a site visit with Ecology staff to confirm wetland ratings. Sound Transit also met with WDFW and Puyallup Tribe of Indians in August 2023 to discuss the design of fish-passable structures and stream relocations. In addition, Sound Transit discussed the requirements for permitting for geotechnical borings with WDFW in 2023.

2.3.1.6 Coordination Regarding Eligible Historic Resources

Sound Transit surveyed and inventoried a total of 86 historic-period, built-environment resources in the Area of Potential Effects (APE) in addition to five archaeological resources. The results were documented in historic property inventory forms in the Washington State Department of Archaeology and Historic Preservation (DAHP) Washington Information System for Architectural and Archaeological Records Data (WISAARD), as well as in a technical report (Appendix G4, Historic and Archaeological Resources Technical Report). Based on the survey results, in October 2023, FTA determined and DAHP concurred that none of the historic-period, built-environment resources surveyed for this project or the archaeological resources within the APE met criteria necessary for eligibility for the National Register of Historic Places (NRHP). Please see Appendix G4, Historic and Archaeological Resources Technical Report, for a copy of the correspondence with DAHP.

In separate consultations, both BPA and FTA determined that the proposed relocation and reconstruction of the NRHP-eligible towers for the Preferred and South 344th Street alternatives would not constitute an adverse effect. In letters dated August 19, 2021, and October 31, 2023, DAHP concurred with this finding.

2.4 Tribal Coordination

FTA and Sound Transit maintain a government-to-government relationship with the sovereign Tribes in the area. The OMF South build alternatives are not on Tribal lands; however, they are within the Usual and Accustomed Fishing Areas of the Muckleshoot Tribe, the Puyallup Tribe of Indians, the Confederated Tribes and Bands of the Yakama Nation, and the Nisqually Indian Tribe.

FTA and Sound Transit consults with the affected Tribes — in a process that is independent of the public involvement process — in areas that the Tribes will have particular interest, such as streams, fisheries, water quality, ecosystems, and cultural resources.

Sound Transit met with the Puyallup Tribe of Indians and the Muckleshoot Indian Tribe to review and discuss the potential ecosystem impacts, particularly to aquatic resources, including fish. On June 2, 2022, Sound Transit met with the Puyallup Tribe of Indians to discuss the Preferred Alternative and potential opportunities for ecosystem mitigation in the Hylebos watershed. Additional meetings with the Puyallup Tribe of Indians related to potential project impacts and ecosystem mitigation were held on April 18, August 18, and August 30, 2023, and February 28, 2024.

FTA and Sound Transit have also coordinated with affected Tribes under the requirements of Section 106, requesting comments on the project's proposed APE and the Section 106 Eligibility and Effects Determination. Further information is found in Appendix G4, Historical and Archaeological Resources Technical Report.

3 OUTREACH ACTIVITIES AND TOOLS

Beginning in 2018, Sound Transit began agency and public outreach efforts for OMF South in coordination with the TDLE project. Outreach methods included online, in-person, existing community efforts, media, English and translated materials (in Spanish, Korean, Vietnamese, Khmer, and Russian) to ensure continual engagement and availability of information throughout Early Scoping, Scoping, 2021 SEPA Draft EIS publication, 2023 NEPA Draft/SEPA Supplemental Draft EIS publication, and additional outreach efforts. Sound Transit engaged with over 950 people in-person to share project information and gather feedback during these outreach efforts. Once TDLE and OMF South outreach events were no longer done together, materials were not translated in Vietnamese and Khmer because those languages are not as commonly spoken in the OMF South project area. However, translation is available in those languages, if requested.

To ensure widely available, accessible project information, Sound Transit used a variety of communication tools and methods, including email updates, a project website, open houses and drop-in sessions, public hearings, fact sheets and brochures, community events, notifications to potentially impacted properties, press releases, and targeted outreach to underrepresented groups.

Each of the outreach periods included online open houses to supplement in-person events. Print, online and media advertisements and project updates disseminated project information throughout each outreach period. A list of the number of mailings sent for each outreach period is outlined below in Table B.3-1.

Table B.3-1 Outreach Mailings

Outreach Period	Number of Mailers Sent
Early scoping	More than 52,160
September 2018 outreach	More than 67,200
SEPA scoping	More than 74,500
November 2019 outreach	More than 43,000
2021 SEPA Draft EIS comment period	Nearly 9,000
2023 NEPA Draft/SEPA Supplemental Draft EIS comment period	More than 5,100

3.1 GovDelivery Listserv

Individuals interested in receiving project information can sign up to receive periodic project updates through email. Sound Transit maintains a database of individuals who have requested to receive updates on project progress and opportunities for public input using a GovDelivery listserv. The listserv includes email addresses of open house attendees, drop-in session attendees, correspondents, commenters, and other interested individuals; for the 2023 Draft EIS, the listserv reached more than 4,800 subscribers.

3.1.1 Briefings

Sound Transit actively seeks opportunities to provide briefings to community and neighborhood groups, organizations, social service providers and businesses in the OMF South project area. Local community groups receive project information, learn about opportunities to provide project feedback and how to stay engaged, and ask questions at these briefings. Many briefings are one-on-one meetings with local stakeholders and community leaders. A full list of community briefings can be found in Section 5, Outreach Stakeholder Briefings, Interviews, and Tabling Events.

3.2 Open Houses and Drop-In Sessions

Sound Transit held open houses and informational drop-in sessions along the project corridor during Early Scoping, Scoping, the 2021 SEPA Draft EIS comment period, the 2023 NEPA Draft/SEPA Supplemental Draft EIS comment period, and additional outreach periods. During Early Scoping in April 2018, September outreach in September 2018, and Scoping in April 2019, Sound Transit held large open houses in three different locations during each outreach period. The project team shared information about alternatives development, project progress, and proposed route and station alternatives. Members of the public were encouraged to attend to speak with members of the project team, ask questions and provide comments and feedback. In November 2019, Sound Transit hosted a series of informal drop-in sessions along the project corridor to provide a project update and share information on alternatives development. In March 2021, Sound Transit hosted two online public meetings to provide information about the 2021 SEPA Draft EIS and offer attendees the opportunity to submit written questions for answers from a panel of Sound Transit staff who represented different disciplines on the project team, including engineering and design, environmental, and property acquisition and relocation. For the NEPA Draft/SEPA Supplemental Draft EIS comment period, Sound Transit hosted two public meetings in October 2023: one online and one in person. The online public meetings preceded formal public hearings for the comment period; see next section.

3.2.1 Public Hearings

Sound Transit has hosted public hearings at the appropriate points during the SEPA process. Specifically, hearings were held during Early Scoping, Scoping, and as part of the 2021 SEPA Draft EIS and the 2023 NEPA Draft/SEPA Supplemental Draft EIS comment period. The Early Scoping and Scoping hearings were held in person and started with an informational open house, with various stations describing different aspects of the project. Sound Transit and consultant team staff were available to answer questions and engage in discussion. The open house was followed by a presentation by Sound Transit staff. Afterward, members of the public were given the opportunity to make oral comments. There were also forms available for those who wanted to make their comments in writing.

Two hearings were held for both the 2021 and 2023 Draft EIS comment periods. Both 2021 meetings and one 2023 meeting were held virtually; the second meeting in 2023 was in person and was similar in format to the meetings described above. As much as possible, the online hearings kept the same format as the in-person hearings. The virtual public hearings included live-captioning, sign-language interpretation, and simultaneous interpretation in Spanish, Korean, and Russian. The virtual hearings were hosted on Zoom, with on-screen and spoken instructions informing people how to tune into the appropriate audio channel on the Zoom Interpretation feature at the bottom of their screen.

3.3 Fact Sheets and Brochures

Sound Transit distributed OMF South fact sheets and brochures to the public throughout the project lifetime. The fact sheets included general project information and timeline, status of alternatives development, information on preferred alternatives and alternatives to be studied in environmental analysis, project contact information, and the project website URL. The project team also developed a fact sheet focused on summarizing potential fieldwork activities and a folio for potentially impacted property owners along the project corridor that provided an overview of what to expect throughout the project lifecycle. Translated versions of these materials are available in Spanish, Korean, and Russian.

3.4 Community Events

The OMF South project team attends existing events held by community organizations in the project area to connect with audiences that may not receive project information otherwise. By attending these events, Sound Transit builds relationships and establishes an ongoing presence in communities in the project area, provides project information and answers questions, and offers ways to stay engaged through project email updates. The project team has focused on attending events in traditionally underserved communities and providing in-language project information. See Table B5.2 for a full list of community events.

3.5 Project Webpage

Sound Transit maintains a project webpage, https://www.soundtransit.org/system-expansion/operations-maintenance-facility-south, for the OMF South project. The webpage includes a project overview and project maps, information on project stakeholders and partners, news and updates, project timeline and milestones, and a document library of published materials. It is kept up to date and is always accessible to users. Project documents on the OMF South website include:

- OMF South Early Scoping Information Report
- OMF South Early Scoping Report and Appendices
- OMF South Scoping Information Report
- OMF South Scoping Summary Report and Appendices
- OMF South Community Engagement and Communications Plan
- OMF South Project Folio
- OMF South 2021 SEPA Draft EIS
- OMF South Title VI Facility Equity Analysis Report
- OMF South 2021 SEPA Draft EIS Comment Summary Report
- OMF South EIS Public Engagement Summary
- OMF South 2023 NEPA Draft/SEPA Supplemental Draft EIS
- OMF South 2023 NEPA Draft/SEPA Supplemental Draft EIS Comment Summary Report

Visitors can also sign up to receive project email updates on the website.

3.6 News Media

Sound Transit publishes notifications and press releases for project updates, events, outreach periods and board meetings in online and print local news publications along the project corridor. See Table B.3-2 at the end of this section for a full list of publications.

3.7 Notifications to Potentially Affected Properties

Beginning in 2018, the project team has met with potentially affected property owners interested in learning more information or members of the public who have requested a briefing throughout the lifetime of the project. Meetings with property owners have focused on providing an overview of the project, discussing potential impacts in further detail, and answering questions. In addition to these meetings, Sound Transit has conducted door-to-door field visits to provide information about the project and distribute project factsheets and brochures. In 2019, Sound Transit began reaching out to potentially affected residents and businesses to coordinate fieldwork efforts to inform design for site alternatives. The property-owner outreach team conducted field visits to key properties within each of the six initial sites during the 2019 Scoping period. In fall 2019, the project team called property owners, hand-distributed flyers, and conducted door-to-door knocking to notify potentially affected areas.

In January 2020, Sound Transit conducted door-to-door outreach to potentially affected properties and properties adjacent to each of the site alternatives. The goal of this outreach was to keep property owners informed and to encourage them to stay engaged with the project as the environmental review process continues.

In January 2021, Sound Transit mailed individual letters to approximately 150 potentially affected property owners identified in the 2021 SEPA Draft EIS for the alternatives being evaluated. The letters included details of the property's inclusion in the 2021 SEPA Draft EIS, and an offer to meet with the project team to discuss individual property impacts in person. Due to the large number of potentially affected properties and the potential for non-responsive property owners, the project team aimed to offer at least 50 percent of potentially impacted property owners the opportunity to engage in a two-way conversation with Sound Transit prior to the release of the 2021 SEPA Draft EIS.

In January 2022, Sound Transit mailed individual letters to potentially affected property owners identified in the 2021 SEPA Draft EIS. The letters informed property owners of Sound Transit Board's identification of the South 336th Street Alternative as the Preferred Alternative in December 2021 and next steps. The letter also invited them to schedule a briefing with the project team for more information. Letters were mailed to the following groups: those potentially affected by the Preferred Alternative (20), those potentially affected by the South 336th Street and Midway Landfill alternatives (125), and those potentially affected by the mainline tracks (11).

Sound Transit also invited mobile home tenants of the Belmor Mobile Home Park (Belmor) to schedule a briefing with the project team to learn about the OMF South project and relocation benefits available to mobile homeowners. The project team held large group briefings with Belmor tenants on March 8 and April 5, 2021, and August 22, August 30, and November 1, 2023, to provide information on potential effects to Belmor, project alternatives and design options, the property acquisition and relocation processes, and findings from the 2021 and 2023 Draft EISs. Sound Transit also sends periodic OMF South project updates to Belmor residents through their monthly newsletter to keep them informed of project progress.

Sound Transit will continue to communicate transparently with property owners about potential impacts to their property, create and maintain relationships with property owners, and answer questions to help clarify the property acquisition process.

3.8 Targeted Outreach

Sound Transit is committed to equitable engagement and inclusive outreach towards community groups, organizations, residents, businesses, and underrepresented populations who do not typically participate in traditional in-person and online open houses or engagement opportunities. The project team has conducted targeted outreach to populations with limited English proficiency, low incomes, and people of color to build long-term relationships and provide meaningful opportunities to engage in the project planning, design, and environmental review processes. The project team reached out to community organizations and social service providers, when possible, to learn more about individual community needs and events to attend.

Sound Transit conducted a preliminary demographic analysis to identify low-income, minority, and limited-English-proficiency populations in the project area. Based on the demographic analysis, Sound Transit provided project literature in Spanish, Korean, Vietnamese, Khmer, and Russian when outreach was coordinated with TDLE. Sound Transit has continued providing materials in Spanish, Korean, and Russian for the OMF South project.

Sound Transit engages with social service providers, community leaders and organizations and other representatives through targeted outreach efforts. Through these efforts, the project team can share project information, build relationships with the community, and how environmental justice populations may experience adverse impacts or benefits from the project. Sound Transit is using several types of targeted outreach, including:

- **Briefings**: Sound Transit met with representatives of individual communities or organizations to provide a project update, answer questions, and learn more about individual circumstances and better ways to engage with their community. Attention and care have been taken to meet people in locations where they may be more comfortable engaging with government agencies. Briefings were adapted to meet the needs of specific audiences, including presentation content, as well as interpretation/translation.
- **Open houses:** Sound Transit chose locations and times that were accessible for the audiences within the project corridor. At open houses, project outreach staff set up tables of materials and resources, answered questions and participated in facilitated conversations. Advertised availability for translation, ASL interpretation, and tactile interpretation was used by individuals who requested these services.
- **Fair or festival booths:** Project staff attended fairs, festivals, and community/cultural celebrations in the project area (Federal Way and Kent) to distribute project information and answer questions from the general public. Outreach staff have hosted a Sound Transit booth with project-specific materials and general South Puget Sound materials. Booths were open to the public and provided basic information, as well as a chance to discuss specific questions in detail.
- **Tabling and drop-in sessions:** Project outreach provided project information and updates and answered questions at community spaces, including transit centers, UW Tacoma, grocery stores, and community centers to reach a wider audience. These tabling sessions were held at multiple days and times (weekdays/weekends, daytime, and evening) to meet varying schedules of community members. Events were open to the public and provided basic information as well as a chance to discuss specific questions in detail.

- **Stakeholder interviews:** The project team conducted a series of interviews with social service organizations and community advocacy groups in the project area to understand their preferred methods of engagement, establish relationships, and introduce them to the OMF South project.
- **Property owner meetings:** Project staff met with property owners along the project corridor to discuss specific questions and concerns; some with language interpretation.
- **Outreach toolkits:** The project team distributed outreach toolkits to social service organizations along the project corridor to encourage sharing of information by trusted leaders with their audiences during outreach periods and to generate additional feedback. The toolkits included project emails, posters, factsheets, Facebook posts and tweets for organizations to post and share.
- **Door-to-door outreach:** Project staff distributed posters and fliers to share project information, advertise upcoming events, and solicit project feedback. This often included outreach to small businesses and property owners in the project areas, particularly those likely to be affected by future alignments or stations.

The targeted outreach efforts and engagement dedicated towards historically underrepresented groups and underserved populations through the strategies outlined above is vital to build connections and gather project related feedback from these communities. Sound Transit has been able to engage with various audiences and involve people representative of the project corridor through these efforts.

Table B.3-2 lists the print and online publications that have been used to advertise project information.

4 OUTREACH DURING ENVIRONMENTAL IMPACT STATEMENT PROCESS

4.1 Early Scoping

The early scoping process was conducted between April 2 and May 3, 2018. Early scoping was conducted concurrently with the TDLE project. More details about early scoping are included in the Tacoma Dome Link Extension and Operations and Maintenance Facility South Early Scoping Summary Report (June 2018) located on the TDLE project website (https://www.soundtransit.org/system-expansion/tacoma-dome-link-extension/documents).

The early scoping notice was published in the Ecology SEPA Register on March 28, 2018, with the comment period beginning on April 2, 2018. Sound Transit also mailed postcards to properties along the corridor, placed print and online advertisements, and posted notices to social media sites. An agency meeting and three community open houses were held during the comment period. Sound Transit asked members of the public to comment on the following:

- The route (alignment), stations, potential alternatives, benefits, and impacts for TDLE
- The potential location, benefits, and impacts for an OMF in the South Corridor (South King and Pierce counties)
- The purpose and need for the project

To support early scoping, Sound Transit held three public open houses in Tacoma, Federal Way, and Fife.

- Open House – Tacoma
  Tuesday, April 17, 2018, 6 to 8 p.m.
  Best Western Plus Tacoma Dome Hotel, 2611 East E Street
- Open House – Federal Way
  Wednesday, April 18, 2018, 6 to 8 p.m.
  Todd Beamer High School, 35999 16th Avenue S
- Open House – Fife
  Tuesday, April 24, 2018, 6 to 8 p.m.
  Fife Community Center, 2111 54th Avenue E

More than 190 people attended the in-person open houses.

In addition, an online open house was available from April 2 to May 3, 2018, to inform the public about the project and provide an opportunity to comment on the project purpose and need, potential sites, and their benefits and impacts. All materials presented at the open house were available online.

Between April 2 and May 3, 2018, over 2,470 unique visitors accessed the online open house.

Over 560 written comments were gathered in person and from online comment forms. Public comments were accepted in various ways, including through email, the online open house, open house comment forms, and mail. In addition, an interactive map tool in the online open house allowed users to place notes at specific locations on a map, and users could indicate if they liked or disliked other commenters' notes. Similarly, at the community open houses, attendees placed Post-it Notes with their input on large maps.

The most common themes in the public comments concerned the following:

- Alignment and station location suggestions
- Parking
- Potential for transit oriented development
- Multimodal connections
- General support and expediting construction
- Concern about taxes and project cost
- Light rail operations and future expansion
- Increased access to employment areas
- Environmental concerns such as air quality, wetlands, vegetation, hazardous materials, geologic hazards, and environmental justice

Outreach activities were advertised with the following methods:

- Mailer notifications sent to over 52,160 homes, apartments, and businesses
- Two news releases on April 2 and April 16, 2018
- Online and print ads in 12 local online and print publications
- Posters distributed to 150 different locations between Kent and Tacoma (included translated versions in Spanish, Korean, Vietnamese, Khmer, and Russian)
- Facebook and "X" (formerly Twitter) ads that reached 30,047 subscribers and 81,500 followers
- Five project updates sent to approximately 5,300 recipients on April 2, April 12, April 16, April 24, and May 2, 2018

4.2 September 2018 Outreach

Between early scoping and scoping outreach, Sound Transit focused on inclusive outreach through stakeholder interviews, briefings, tabling events, and fairs and festivals with community groups, organizations, residents, businesses, and underrepresented populations along the project corridor in mind (more information below). This included a project update during a series of three open houses and an online open house. Sound Transit offered shared project updates for the OMF South and TDLE and sought feedback on initial route and station concepts. Although OMF South was not the focus of this outreach and no feedback was sought for the project, staff was available to answer questions and provide updates about the project. A display was presented at the three open houses and the online open house and provided general updates on the OMF siting process since early scoping.

Outreach Activities:

- Open House – Federal Way
  Tuesday, September 11, 2018, 6 to 8 p.m.
  Federal Way Performing Arts Center, 31510 Pete von Reichbauer Way S
- Open House – Fife
  Wednesday, September 12, 2018, 6 to 8 p.m.
  Fife High School, 5616 20th Street E
- Open House – Tacoma
  Wednesday, September 19, 2018, 6 to 8 p.m.
  Best Western Plus Tacoma Dome Hotel, 2611 East E Street

More than 175 people attended the three in-person open houses to provide comment and feedback on the route and station concepts for TDLE.

These activities were advertised as follows:

- Postcard notifications distributed to over 67,000 homes, apartments, and businesses in the project area
- Three project email updates sent to more than 6,200 recipients on the project listserv
- Posters distributed to over 150 locations throughout Federal Way, Fife, Milton, Tacoma, and Tribal areas
- Print and online display advertisements in 11 local publications
- Facebook posts on the Sound Transit page, reaching over 13,000 users and engaging over 600 people
- Sound Transit tweets, reaching over 18,000 “X” users and engaging 271 users with 16 retweets and 17 likes
- One news release on August 30, 2018
- Notification toolkits distributed to local community organizations

4.3 SEPA Scoping

When Sound Transit initiated the formal SEPA scoping process, the OMF South environmental review had been split from the TDLE process. Unlike early scoping, which addressed both projects, the SEPA scoping process described here solely addressed the OMF South project. This section also discusses how the scoping process influenced the development of alternatives.

During scoping, Sound Transit asked for comments on the proposed range of alternatives, the purpose and need for the project, the environmental effects and benefits to be analyzed, the probable significant adverse impacts, mitigation measures, and license or other approvals that may be required.

4.3.1 Public Comment Period and Scoping Meetings

Sound Transit published the Determination of Significance/Scoping Notice in the SEPA Register on February 19, 2019. The comment period for scoping was from February 19 to April 1, 2019. This period exceeded the 30 days required under SEPA regulations and allowed additional time for public, agency, and Tribal comment.

During this period, two open houses were held to inform and obtain input from the community (one in Federal Way and the other in Kent):

- Open House – Federal Way
  Tuesday, March 12, 2019, 6 to 8 p.m.
  Federal Way Performing Arts and Events Center, 31510 Pete von Reichbauer Way S
- Open House – Kent
  Wednesday, March 20, 2019, 6 to 8 p.m.
  Highline College, 2400 S 240th Street, Des Moines

In addition to the open houses, a meeting was held for Tribes, agencies, and cities on March 12, 2019.

- Agency Scoping Meeting
  Tuesday, March 12, 2019, 1 to 2:30 p.m.
  Federal Way Performing Arts and Events Center, 31510 Pete von Reichbauer Way S

Information on the purpose and need of the project, potential OMF South site locations with maps and technical details, details about the environmental review process, and the project timeline were presented at the open houses.

All public meeting locations were accessible to persons with disabilities. Alternative formats and translation services were available, including an accessible laptop with screen reader software. American Sign Language interpretation was requested and provided at the Federal Way open house. Visitors were able to comment on the site options with written comment forms, online comment forms on the online open house with laptops provided, or verbally to a court reporter who transcribed comments. More than 370 people attended the in-person public scoping meetings and 15 agency representatives attended the agency scoping meeting.

During the scoping process, an online open house was available from February 19 to April 1, 2019, and allowed the public to review and provide feedback on potential site locations. The online open house featured the project purpose and need, information about the scoping period and the EIS, and the advantages and disadvantages of each of the six potential OMF South sites. The website included all information that was presented at the in-person open houses. Users were asked to provide comments on the six potential site options.

Between February 19 and April 1, 2019, the online open house received more than 3,400 unique visitors who used a social share widget and shared over 25 times.

Commenters had several ways to comment during the scoping period in addition to the open houses and online open house. They could also comment via email, mail, or phone. Over 1,400 comments were received via in-person and online comment forms during the scoping period, as well as over 2,000 email comments leading up to scoping. Outreach activities and opportunities and ways to provide comment during the scoping process were advertised as follows:

- Newsletters mailed to over 74,000 households and businesses
- Posters distributed to 301 locations throughout Federal Way, Fife, Milton, Tacoma, and Tribal areas
- Four project email updates sent to more than 6,200 recipients on the South Sound email list
- Notification toolkits sent to 13 local organizations to share with constituents and members
- Print and online display advertisements in 10 local publications
- Social media posts, reaching over 9,000 Facebook users and engaging over 250 “X” users

How Comments Were Used

After the end of the comment period on April 1, 2019, Sound Transit collected and considered the comments received and prepared a scoping report to summarize the comments. The report was publicly available on the project website.

The comments received during the scoping period were considered by Sound Transit Board to identify the alternatives to study in the 2021 SEPA EIS.

Scoping Comment Summary

The OMF South Scoping Summary Report (Sound Transit 2019) summarizes the comments received during scoping. Generally, public, agency, and Tribal comments focused on the following:

- Concern over potential site alternatives that commenters believed could preclude future transit oriented development opportunities, specifically the S 240th Street and SR 99 site, which includes Dick’s Drive-In
- Concern about potential business displacements and other economic impacts
- For the alternatives in Federal Way, concerns about potential impacts to Hylebos Creek and its associated wetlands

Most commenters who expressed a site preference stated that one or either of the Midway Landfill sites were superior to the others.

4.4 Public Outreach during 2021 SEPA Draft Environmental Impact Statement Development

4.4.1 November 2019 Outreach Activities (November 13 to December 6, 2019)

In November and December of 2019, Sound Transit held a series of drop-in sessions to provide the public opportunities to learn more about both TDLE and OMF South. There was also an online open house available from November 13 through December 6, 2019. More than 250 people attended the drop-in sessions, and over 1,600 users participated in the online open house.

These were primarily opportunities for information sharing. Although it was not a formal comment period, Sound Transit received approximately 20 comments from in-person and online comment forms. Commenters primarily had questions about Sound Transit's property acquisition process and timeline and how the recent passage of I-976 could affect the project. Commenters who expressed a site preference generally encouraged Sound Transit to choose the Midway Landfill Alternative.

The drop-in sessions were conducted at the following locations:

- Federal Way Link Extension Open House
  Wednesday, November 13, 2019, 6 to 8 p.m.
  Highline College, 2400 S 240th Street, Des Moines
- Drop-in session – Federal Way
  Saturday, November 16, 2019, 10 a.m. to noon
  Federal Way Library, 34200 1st Way S
- Drop-in session – Kent
  Tuesday, November 19, 2019, 8 to 10 a.m.
  Fred Meyer, 25250 Pacific Highway S
- Federal Way Link Extension Open House
  Wednesday, November 20, 2019, 6 to 8 p.m.
  Federal Way Performing Arts Center, 31510 Pete von Reichbauer Way S
- Drop-in session – Federal Way
  Wednesday, December 4, 2019, 5 to 7 p.m.
  Federal Way Community Center, 876 S 333rd Street

An online open house was available from November 13 to December 9, 2019. All materials from the drop-in sessions were available on the site. The site provided a project update on the three sites to be studied in environmental review and laid out the timeline for the project as well as the next opportunity for the public to provide comments and feedback.

The site had a landing page translated into Khmer, Korean, Russian, Spanish, and Vietnamese, with instruction on how to use Google Translate to navigate the site. The site also included in-language content for all aforementioned languages.

Between November 13 and December 9, 2019, the online open house had more than 1,600 unique visitors. These visitors used a social share widget on the site, sharing it 18 times. These activities were advertised with the following:

- Mailers and notifications sent to over 43,000 homes and businesses
- Social media posts reaching over 16,000 Facebook users and engaging over 5,000 "X" users
- Posters distributed to 105 different locations throughout SeaTac, Kent, Des Moines, and Federal Way
- Three project email updates sent to more than 6,200 recipients on South Sound email lists
- Notification toolkits sent to 12 local organizations to share with constituents and members
- Print and online display advertisements in eight local publications

4.5 2021 SEPA Draft Environmental Impact Statement Comment Period

Sound Transit published notification of the availability of the 2021 SEPA Draft EIS in the SEPA Register on March 5, 2021. The 45-day comment period was from March 5 to April 19, 2021. Public comments could be submitted through comment forms on the 2021 SEPA Draft EIS website (see online open house below), email, letter, voicemail, or as verbal comments during the public hearing portion of two online public meetings and hearings on March 24 and March 30. Sound Transit received more than 270 comments on the 2021 SEPA Draft EIS. See the 2021 SEPA Draft EIS public engagement summary for more details. It is posted online at www.soundtransit.org/sites/default/files/documents/operations-and-maintenance-facility-south-public-engagement-summary-20211110.pdf.

4.5.1 Public Comment Period, Online Open House, and Public Meetings and Hearings

Online Open House

The online open house launched on March 5, 2021, and concluded on April 19, 2021. Information presented on the online open house included project background and history, details about the environmental review process, analysis of the three OMF South build alternatives with maps and statistical comparisons, and the project timeline. The online open house was fully translated into Spanish, Korean, and Russian and included Google Translate so users could translate webpage text into additional languages. Users were able to submit comments on the 2021 SEPA Draft EIS findings via a comment form on the online open house. Over 2,400 users visited the online open house during the comment period.

Online Public Meetings and Hearings

During this period, Sound Transit hosted two online public meetings and hearings via Zoom Webinar to provide general information about the 2021 SEPA Draft EIS and offer attendees the opportunity to provide public comment. A live captioner provided simultaneous subtitles in English. Spanish, Korean, and Russian interpreters provided simultaneous interpretation in audio channels. Sound Transit staff communicated the language and accessibility features throughout the meetings and hearings to ensure attendees understood how to fully participate. More than 120 people attended the virtual public meetings and hearings.

- Online public meeting and hearing #1
  Wednesday, March 24, 2021, 5:30 to 8:30 p.m.
  Zoom Webinar
- Online public meeting and hearing #2
  Tuesday, March 30, 2021, 11 a.m. to 1 p.m.
  Zoom Webinar

The first hour of the meeting consisted of a prerecorded presentation and a live question-and-answer segment. The presentation provided an overview of the OMF South project and the 2021 SEPA Draft EIS comment period. The Q&A segment offered the public the opportunity to submit written questions for answers from a panel of Sound Transit staff who represented different disciplines on the project team, including engineering and design, environmental, and property acquisition and relocation.

During the public hearing section of the virtual meeting, a representative of Sound Transit was present to listen to attendees who wanted to provide public comments. A court reporter documented the verbal public comments for incorporation into the 2021 SEPA Draft EIS. While all members of the public were invited to provide comments, in an effort to center on equity and provide access to people who have historically been excluded from public processes, Sound Transit invited attendees who identified as people of color, people with disabilities, and anyone working with an interpreter the opportunity to speak first before opening the floor to the rest of the attendees. Ten people submitted comments during the public hearing section of the virtual meeting.

The dates of the online open house and virtual public meetings and hearings were advertised as follows:

- Legal notices in The Seattle Times, The News Tribune, and Seattle Daily Journal of Commerce
- Several posts on Sound Transit's Facebook page (33,433 subscribers) and "X" account (88,700 followers)
- 8,962 mailers sent to homes, apartments, and businesses in Kent and Federal Way within 0.5 mile of the build alternatives. The mailer included translations in Korean, Russian, and Spanish
- One news release and three update notices to an email list with approximately 7,000 subscribers
- Display advertisements and online community calendar postings in seven local online and print publications and promoted posts on Facebook for zip codes in the project area

2021 SEPA Draft Environmental Impact Statement Comment Summary

The OMF South Comment Summary Report summarizes the comments received during the comment period. The Comment Summary Report was made available on Sound Transit's website on November 21, 2021. The Sound Transit Board considered the 2021 SEPA Draft EIS analysis and the comments received before identifying the Preferred Alternative for the project.

4.6 2023 NEPA Draft/SEPA Supplemental Draft Environmental Impact Statement Scoping

FTA and Sound Transit published a Notice of Intent in the Federal Register on July 19, 2023. The notice initiated a 30-day comment period where agencies, Tribes, and members of the public were invited to comment on the proposed scope of the EIS, particularly on changes made to the proposal since the 2021 SEPA Draft EIS.

4.7 2023 NEPA Draft/SEPA Supplemental Draft Environmental Impact Statement Public Comment Period

The Draft EIS was published on September 22, 2023. There was a 45-day comment period, during which Tribes, agencies, and members of the public were invited to comment. The comment period ended November 6, 2023.

4.7.1 Public Comment Period, Online Open House, and Public Meetings and Hearings

Public engagement for this comment period included:

Online Open House (omfsouth.participate.online)

An online open house was live for the duration of the comment period (September 22 to November 6, 2023). The public could visit the website to review what had changed since the 2021 SEPA Draft EIS and review a summary of the findings of the NEPA Draft/SEPA Supplemental Draft EIS and supporting materials, along with submitting comments via an online comment form. In addition to English, the website was also available in Korean, Russian, and Spanish. The website contained accessibility features, including screen-reader-friendly content and detailed alternative text. Digital factsheets and documents throughout the site were made into accessible PDFs. A total of 1,321 people visited the online open house including the following: 1,241 visitors to the English site, 72 visitors to the Spanish site, two visitors to the Korean site, and six visitors to the Russian site.

Public Meetings and Hearings

Sound Transit hosted one online public meeting and one in-person public meeting to provide general information about the Draft EIS and offer attendees the opportunity to provide public comment.

The online public meeting was held on Zoom on Thursday, October 19, from 11:30 a.m. to 1:30 p.m. More than 20 people attended the meeting. The first portion of the virtual meeting consisted of a presentation and a live question-and-answer (Q&A) segment. The presentation provided an overview of the OMF South project and the 2023 NEPA Draft/SEPA Supplemental Draft EIS comment period. The Q&A segment offered the public the opportunity to submit written questions for answers from a panel of Sound Transit staff who represented different disciplines on the project team, including engineering and design, environmental, and property acquisition and relocation. The second portion of the online meeting consisted of a public hearing with a representative of Sound Transit listening to attendees who wanted to provide a public comment. Public hearing comments were captured by a court reporter.

The in-person meeting was held at the Federal Way Performance Arts & Events Center on Tuesday, October 24, 2023, from 5:30 to 7:30 p.m. More than 25 people attended the meeting. The in-person meeting included an open house where members of the public could browse displays with information on the environmental review process and Draft EIS findings. Sound Transit subject-matter experts were available to answer questions from the public. The event also included an overview presentation on OMF South and the NEPA Draft/SEPA Supplemental Draft EIS comment period. Following the presentation, members of the public could return to the open house or participate in the public hearing, with a representative of Sound Transit listening to attendees who wanted to provide a public comment. Public hearing comments were captured by a court reporter and attendees were also able to fill out a written comment form at the meeting.

Both meetings utilized standard accessibility features. The online meeting featured live captioning (in English) and was screen-reader accessible. Sound Transit offered simultaneous interpretation in American Sign Language, Spanish, Korean, and Russian at the online and in-person meetings. The in-person meeting also included translated materials in Spanish, Korean, and Russian. Sound Transit staff communicated the language and accessibility features throughout the public meetings and hearings to ensure attendees understood how to fully participate. Languages available for interpretation were based on the demographic data of the study area.

Mailers

The project team sent 5,170 mailers to residences and businesses within 0.5-mile of site alternatives. The mailer included translations in Korean, Russian, and Spanish. The content included information about the comment period, an overview of site locations, directions on how to comment, and resources about where recipients could find more information about the OMF South environmental review process and access the NEPA Draft/SEPA Supplemental Draft EIS.

Posters

To increase awareness of the comment period, the project team distributed posters to eight community gathering spaces and other areas where the public is likely to congregate in Kent and Federal Way. The poster included information on the online open house, public meeting and hearing dates, and how to submit a comment. The poster included translations in Korean, Russian, and Spanish.

Online and Print Display Ads for South Sound Publications

Sound Transit ran print display ads and online ad campaigns in six publications throughout the comment period. Ad placements included English, Spanish, Korean, and Russian publications to reach audiences in the project area and region. Online ads were geo-targeted, when possible, to focus on audiences in Kent and Federal Way. The ad messaging communicated learning more about the NEPA Draft/SEPA Supplemental Draft EIS and providing new comments on it. The project team placed ads in the following publications: Kent Reporter, Federal Way Mirror, International Examiner, El Siete Dias, Korean Times Seattle, Russian Town Seattle, and Facebook (geotargeted ads in English, Spanish, and Russian).

Legal Notices

Sound Transit ran a legal notice about the availability of the NEPA Draft/SEPA Supplemental Draft EIS for public comment in the Seattle Times, the Tacoma News Tribune, and the Daily Journal of Commerce. Legal notices were run on September 22, September 29, and October 6, 2023. The legal notice provided information on the project, availability of the SEPA Draft/NEPA Supplemental Draft EIS, public meeting times and locations, and how to comment.

Sound Transit Project Listserv Updates

The project team sent four email updates regarding the NEPA Draft/SEPA Supplemental Draft EIS comment period to over 4,800 subscribers of the OMF South project listserv. The purpose of these listserv updates was to announce publication of the document and the comment period, direct recipients on how to access the document and submit comments, and invite people to the online public meetings and hearings.

Social Media

Sound Transit promoted the OMF South 2023 Draft EIS comment period and online open house through content on Sound Transit’s Facebook account. This included posts and events for the two public meetings and hearings on Facebook reaching 224 people.

Sharing Physical Materials

To increase accessibility for the community, project staff mailed physical copies of the NEPA Draft/SEPA Supplemental Draft EIS to frequently visited community hubs, including the Federal Way Library, Federal Way 320th Library, Federal Way Community Center, Federal Way City Hall, Kent Library, Kent Commons Community Center, and Kent City Hall, and to other locations by community request.

Outreach Toolkits

During the comment period, the project team distributed four outreach toolkits to local organizations and governments so they could amplify the EIS comment period and the opportunity to comment to their respective networks. The outreach toolkit included a digital flyer and social media posts.

5.4 NEPA Draft/SEPA Supplemental Draft Environmental Impact Statement Comment Period

Sound Transit sought briefings with agency partners to continue building relationships. Discussion topics included the EIS process, updated Draft EIS findings, and next steps for the OMF South project. Sound Transit met separately with the cities of Federal Way and Kent.

Property owners have had the opportunity to request briefings with members of the project through an online scheduling tool. Briefings with property owners included project updates and information on the property acquisition and relocation process.

Sound Transit met separately with GarageTown (2 attendees) and Belmor residents (59 attendees) during the comment period to speak about NEPA Draft/SEPA Supplemental Draft EIS findings, answer questions, and share how to comment on the Draft EIS.

1 INTRODUCTION

The Central Puget Sound Regional Transit Authority (Sound Transit) proposes to construct an operations and maintenance facility (OMF) in the South Corridor to support Sound Transit's Link light rail system expansion. Sound Transit is evaluating three alternatives for the Operations and Maintenance Facility South (OMF South) Project in its South Corridor service area: two in Federal Way and one in Kent. Both cities are located in King County, Washington.

This appendix of the OMF South Final Environmental Impact Statement (EIS) documents the environmental justice analysis conducted for the No-Build and build alternatives for the OMF South project. The analysis defines and describes the minority and low-income populations present in the study area; describes the project effects on minority and low-income populations; identifies measures to avoid, minimize, or mitigate potential adverse effects; and makes a determination of whether the project has disproportionate and adverse effects on these populations. This appendix also summarizes the public outreach to minority and low-income populations within the project area.

1.1 Project Background

1.1.1 Sound Transit Mission

As stated in the 2020 Five-Year Agency Strategic Plan (Sound Transit 2020), Sound Transit's mission statement is:

> Connecting more people to more places to make life better and create equitable opportunities for all.

1.1.2 Sound Transit System Planning

Sound Transit's system planning has served to develop transit improvements throughout the three-county Sound Transit service district. The service district consists of King, Pierce, and Snohomish counties. Sound Transit is currently implementing Sound Transit 3: The Regional Transit System Plan for Central Puget Sound (Sound Transit 3). Sound Transit 3 builds on the programs of Sound Move and Sound Transit 2 and seeks to expand the regional light rail system north to Everett; south to Federal Way and Tacoma; east to downtown Redmond, south Kirkland, and Issaquah; and west to Ballard and West Seattle, totaling 116 miles with over 80 stations. See Figure 1-1 for a map of Sound Transit's planned future expansion.

Figure E.1-1 Link System Future Expansion and OMF Site Locations

As shown in Figure E.1-1, the Sound Transit light rail system will serve four corridors: north, central, east, and south. Future improvements, including existing and planned maintenance facilities, for each of the corridors are outlined below.

- North Corridor: Sound Transit 3 would extend light rail north from the Lynnwood Transit Center that is under construction to downtown Everett via the Southwest Everett Industrial Center. The line includes six stations serving the areas of West Alderwood Mall: Ash Way, Mariner, Southwest Everett Industrial Center, State Route (SR) 526 near Evergreen Way, and the area at the existing Everett Station. A future light rail OMF would be located in the North Corridor, with similar programming functions to OMF South. The facility will maintain and store a portion of the light rail fleet for the future Everett to Alaska Junction and Mariner Way to Downtown Redmond services.
- Central Corridor: Sound Transit 3 would add two light rail extensions in Seattle. The first would extend light rail from downtown Seattle to West Seattle, with stations serving the sports stadiums; the SODO, Delridge, and Avalon districts/neighborhoods; and the Alaska Junction business district. In addition, light rail would extend to Ballard, with stations serving the International District/Chinatown, Midtown, Westlake, Denny, South Lake Union, Seattle Center, Smith Cove, Interbay, and Ballard districts/neighborhoods. Three infill stations would be added serving NE 130th Street, S Graham Street, and S Boeing Access Road near Interstate 5 (I-5). Connections to the existing OMF Central would be built to service vehicles operating in this corridor. The existing OMF Central would maintain and store a portion of the light rail fleet for multiple lines.
- East Corridor: Sound Transit 3 would extend light rail east of Seattle, connecting Redmond, Bellevue, south Kirkland, and Issaquah to each other and to the regional system. Eastside investments include two stations serving southeast Redmond and downtown Redmond that are currently under construction, along with a new light rail line from south Kirkland to Issaquah via Bellevue. Four stations would be included on the light rail extension, serving south Kirkland, the Richards Road area, Eastgate near Bellevue College, and central Issaquah. Maintenance needs in the east corridor would be served by the recently completed OMF East, which will maintain and store a portion of the light rail fleet for the Mariner Way to Downtown Redmond and South Kirkland to Issaquah services.
- South Corridor: Sound Transit 3 would extend light rail south from Kent/Des Moines to Federal Way, with stations serving South 272nd Street and the Federal Way Downtown Station. These are currently in construction. From there, light rail would continue south to Pierce County, with stations in south Federal Way, Fife, and Tacoma, where it would provide a multimodal connection to the existing Tacoma Link, the Sounder commuter rail, the Sound Transit Express Bus, and Amtrak. Sound Transit 3 also includes an expansion of Tacoma Link to Tacoma Community College, with six stations. OMF South (the proposed project) would be built in the South Corridor to maintain and store a portion of the future light rail fleet for FWLE (currently under construction) and the West Seattle/Ballard to Tacoma Dome service and to receive, test, commission, store, maintain, and deploy new light rail vehicles (LRVs) and materials for maintenance of the mainline track for the entire system.

1.1.3 OMF South Purpose and Need

The purpose of OMF South is to:

- Provide a facility with the capacity to receive, test, commission, store, maintain, and deploy vehicles to support the intended level of service for the system-wide light rail system expansion.
- Support efficient and reliable light rail service that minimizes system operating costs.

- Support and connect efficiently to the regional system and be technically and financially feasible to build, operate, and maintain, consistent with Sound Transit 3 and Sound Transit's Regional Transit Long-Range Plan.

The project is needed because:

- The current regional system lacks a facility with sufficient capacity and suitable location to support the efficient and reliable long-term operations for system-wide light rail expansion, including the next phase of expansion in King and Pierce counties.
- New light rail maintenance and storage capacity needs to be available with sufficient time to accept delivery of and commission new vehicles to meet the expansion needs outlined in Sound Transit 3 and to store existing vehicles while the new vehicles are tested and prepared.

The OMF South project is necessary to support the addition of approximately 144 LRVs as part of the Sound Transit 3 system expansion. The facility includes functions that support the entire Link light rail system, such as receiving, testing, and commissioning new LRVs. In addition, OMF South would include Maintenance of Way facilities and a Link System-Wide Storage building to receive and store vehicle, track, and station parts and components.

1.2 Regulatory Framework

The environmental justice analysis was performed in compliance with:

- Presidential Executive Order (EO) 12898, Federal Actions to Address Environmental Justice in Minority Populations and Low-Income Populations, February 11, 1994
- U.S. Department of Transportation (DOT) Order on Environmental Justice, Department of Transportation Order 5610.2C – Actions to Address Environmental Justice in Minority Populations and Low-Income Populations, May 14, 2021
- Circular FTA C-4703.1, Environmental Justice Policy Guidance for Federal Transit Administration Recipients, August 15, 2012
- Executive Order 14096, Executive Order to Revitalize our Nation's Commitment to Environmental Justice for All, April 21, 2023

EO 12898 provides that ". . . each Federal agency shall make achieving environmental justice part of its mission by identifying and addressing, as appropriate, disproportionately high and adverse human health or environmental effects of its programs, policies, and activities on minority populations and low-income populations in the United States and its territories and possessions, the District of Columbia, the Commonwealth of Puerto Rico, and the Commonwealth of the Mariana Islands." The EO addresses the importance of public participation in the review process. EO 14096 – "Revitalizing Our Nation's Commitment to Environmental Justice for All" was enacted on April 21, 2023. EO 14096 requires agencies to "identify, analyze, and address disproportionate and adverse human health and environmental effects (including risks) and hazards of Federal activities, including those related to climate change and cumulative impacts of environmental and other burdens on communities with environmental justice concerns." EO 14096 on environmental justice does not rescind EO 12898, which has been in effect since February 11, 1994, and is currently implemented through the May 14, 2021 DOT Order 5610.2C. This implementation will continue until further guidance is provided regarding the implementation of the new EO 14096 on environmental justice.

The U.S. DOT issued DOT Order 5610.2(a), which established the procedures to use to comply with EO 12898, to avoid disproportionate and adverse effects on minority and low-income populations. The order has been superseded twice and is now U.S. DOT Order 5610.2C. The DOT order requires agencies to observe the following principles (DOT Order 5610.2C, § 6(b)):

1. Planning and programming activities for policies, programs, and activities that have the potential to have a disproportionately high and adverse effect on human health or the environment shall include explicit consideration of the effects on minority populations and low-income populations.
2. Steps shall be taken to provide the public, including members of minority populations and low-income populations, access to public information concerning the human health or environmental impacts of programs, policies, and activities, including information that will address the concerns of minority and low-income populations regarding the health and environmental impacts of the proposed action. This includes ensuring that information is made available in languages other than English and in accessible formats for persons with disabilities.

The DOT order further explains that "In making determinations regarding disproportionately high and adverse effects on minority and low-income populations, mitigation and enhancement measures that will be implemented and all offsetting benefits to the affected minority and low-income populations may be taken into account, as well as the design, comparative impacts, and the relevant number of similar existing system elements in non-minority and non-low-income areas." (DOT Order 5610.2C, § 9(b)).[1] The following definitions are from the DOT order for disproportionate and adverse effects, minority persons, and low-income persons:

Disproportionate and adverse effect on minority and low-income populations means an adverse effect that is predominantly borne by a minority population and/or a low-income population or will be suffered by the minority population and/or low-income population and is appreciably more severe or greater in magnitude than the adverse effect that will be suffered by the non-minority population and/or non-low-income population (DOT Order 5610.2C, Appendix § 1(g)).

Minority person means a person who is:

- Black: a person having origins in any of the black racial groups of Africa.
- Hispanic or Latino: a person of Mexican, Puerto Rican, Cuban, Central or South American, or other Spanish culture or origin, regardless of race.
- Asian American: a person having origins in any of the original peoples of the Far East, Southeast Asia, the Indian subcontinent.
- American Indian or Alaskan Native: a person having origins in any of the original people of North America and South America (including Central America) and who maintains cultural identification through tribal affiliation or community recognition).
- Native Hawaiian and Other Pacific Islander: a person having origins in any of the original peoples of Hawaii, Guam, Samoa, or other Pacific Islands (DOT Order 5610.2C, Appendix § 1(c)).

---

[1] Under EO 14096, agencies will continue their efforts to advance environmental justice in ways that complement and deepen prior work. EO 14096 uses the term "disproportionate and adverse" as a simpler, modernized version of the phrase "disproportionately high and adverse" used in EO 12898. Those phrases have the same meaning but removing the word "high" eliminates potential misunderstanding that agencies should only be considering large disproportionate effects. FACT SHEET: President Biden Signs Executive Order to Revitalize Our Nation's Commitment to Environmental Justice for All | The White House.

Low-income person means a person whose median household income is at or below the Department of Health and Human Services poverty guidelines (DOT Order 5610.2C Appendix § 1(b)).

For the purposes of this assessment, a low-income person is defined as a person whose median household income is less than or equal to two times the Federal Poverty Level, which in 2018 was $24,280 for an individual. This is consistent with the local threshold that Sound Transit and other regional transit agencies use in determining eligibility for reduced fare programs and reflects the increasingly high cost of living in the region. In this assessment, individuals considered low income will include persons living below this threshold.

In addition to the relevant regulations considered for all environmental analyses, the following list of federal, state, and local regulations; executive orders; and plans and/or policies that guide the assessment of environmental justice effects are considered as part of this analysis:

- Title 49 of the Code of Federal Regulations Part 21 (49 CFR 21), Nondiscrimination in Federally Assisted Programs of the Department of Transportation, Effectuation of Title VI of the Civil Rights Act of 1964.
- Uniform Relocation Assistance and Real Property Acquisition Policies Act of 1970, as amended (Uniform Relocation Act, 42 U.S. Code 61). This act defines the federal regulations governing property acquisition and relocation for federally funded projects.
- Washington State Department of Transportation Environmental Manual, Chapter 458, Social and Community Effects, and Chapter 460, Environmental Justice (WSDOT 2023).

2 METHODS AND APPROACH

The purpose of this analysis is to identify, analyze, and address potential disproportionate and adverse effects on minority or low-income populations from the OMF South project. The regulatory framework and definitions of these populations is included in Section 1.2 above.

The OMF South environmental justice analysis follows FTA Circular C 4703.1 Chapter II, Conducting Environmental Justice Analysis, to determine whether the project would result in disproportionate and adverse effects. This includes:

- Creating a residential demographic profile through demographic data to help determine where environmental justice populations are located, including census data and supplemental data, such as elementary school statistics and information collected through community engagement.
- Implementing a targeted public engagement plan that encourages the meaningful engagement by all members of the affected communities to inform the environmental justice analysis.
- Identifying the potential for disproportionate burdens on environmental justice versus non-environmental justice populations by comparing the percentage of low-income and minority populations in the study area to the Sound Transit service district average. This is used to understand how the distribution and concentration of minority and low-income populations that could be affected by the project relate to the broader geographic area where Sound Transit provides services. The Sound Transit service district includes the area that would experience impacts and receive benefits of Sound Transit projects and consists of the urbanized areas of King, Pierce, and Snohomish counties that are within the Sound Transit taxing district.
- Identifying adverse effects of the project.
- Analyzing whether adverse effects are disproportionate. This includes wholistic consideration of the project impacts, mitigation, and benefits. The FTA Circular states that “Many public transportation projects involve both adverse effects such as short-term construction impacts, increases in bus traffic, etc., and positive benefits such as increased transportation options, improved connectivity, or overall improvement in air quality. Whether adverse effects will be disproportionately high is dependent on the net results after consideration of the totality of the circumstances.”
- Determining whether the adverse effect would be borne by environmental justice populations by considering:
  - Whether the adverse effects on environmental justice populations exceed those borne by non-environmental justice populations.
  - Whether cumulative or indirect effects would adversely affect an environmental justice population.
  - Whether mitigation and enhancement measures will be taken for environmental justice and non-environmental justice populations.
  - Whether there are off-setting benefits to environmental justice populations as compared to non-environmental justice populations.

2.1 Study Area

The study area for the environmental justice analysis encompasses an approximately 0.5-mile radius from the project's potential construction limits for each of the build alternatives. This area is where direct and indirect project impacts could occur to adjacent populations based on the analysis in Chapter 3, Affected Environment, Environmental Impacts, and Mitigation Measures, of the OMF South Final EIS. A 0.5-mile study area also captures and reflects the demographic characteristics of the affected population more accurately than a larger study area. For example, for OMF South, a larger 1-mile study area would include populations that are unlikely to experience adverse effects and would also decrease the percentage of affected low-income and minority populations considered in the analysis. This could unintentionally mask or underestimate the project's potential adverse effects to environmental justice populations.

2.2 Data Sources

The environmental justice analysis is based on U.S. Census Bureau data reported at the census tract and block-group levels. A census tract is a small subdivision of an urban area used by the U.S. Census Bureau to identify population and housing statistics. Census blocks are subdivisions of census tracts and are the smallest geographical units for which the U.S. Census Bureau collects data. The boundaries of census blocks are generally streets or other notable physical features and often correspond to a city block. A census block group is a combination of census blocks, typically encompassing two to four city blocks, and is the smallest geographical unit for which yearly census data are published. This analysis uses demographic data at the block group level to provide a more accurate portrayal of environmental justice populations within the OMF South alternative study areas, given the localized nature of the project's potential impacts.

The analysis compares minority and low-income population data between the study area for each OMF South alternative, the cities of Federal Way and Kent, and the Sound Transit service district. The purpose of these comparisons is to understand how minority and low-income populations could be affected by the proposed project and how the distribution and concentration of those populations within the project study areas compare to the broader relevant geographic area where Sound Transit provides services.

Available datasets from the U.S. Environmental Protection Agency (EPA) EJScreen (Environmental Justice Screening and Mapping) and the Council on Environmental Quality's Climate and Economic Justice Screening tool were used to validate environmental justice characteristics in the study area (EPA 2022).

Elementary school data were used to enhance Sound Transit's understanding of the communities surrounding the project. Elementary school data were used primarily because they better represent the project study area they overlap since the attendance areas are geographically smaller than middle or high school attendance areas. The data source was the 2022–2023 school year Washington State Report Card published by the Washington State Office of Superintendent of Public Instruction (OSPI 2022).

Affordable housing was identified in the study areas by reviewing information from the U.S. Department of Housing and Urban Development and King County Housing Authority to identify properties and housing developments that provide subsidized housing or housing assistance for low-income and cost-burdened families.

3 AFFECTED ENVIRONMENT

The following section summarizes the population demographics and community facilities within the 0.5-mile study area for each OMF South build alternative. As a comparison, this section also summarizes the population demographics of the Sound Transit service district. This section largely relies on publicly available data for the basis of the analysis; sources are noted where additional information from in-person contacts, local knowledge, and other research was used.

3.1 Study Area Demographics

Demographic characteristics for minority and low-income populations within 0.5-mile of each build alternative were determined based on estimates from the U.S. Census Bureau's 2016–2020 5-year American Community Survey (ACS) data.

As noted above, in addition to U.S. Census data, available datasets from EJScreen were used to validate environmental justice characteristics in the study area. The EJScreen reports are included in Attachment A. Further analysis into elementary school demographics was conducted based on Washington State Report Card data published by OSPI.

Table E.3-1 summarizes the study area's demographic characteristics and compares them with those of the cities of Federal Way, Kent, and Des Moines, and the Sound Transit service district. Table E.3-2 summarizes race and ethnicity characteristics and compares them across the same study areas and jurisdictions.

In addition to Tables E.3-1 and E.3-2 below, geographic information system maps were developed to visually illustrate demographic characteristics within each study area. Figures E.3-1 through E.3-3 depict minority populations for each build alternative, and Figures E.3-4 through E.3-6 show low-income populations at the census block group level.

These data show that the study area for each build alternative has relatively similar concentrations of low-income and minority populations. Minority persons account for approximately 66 to 68 percent of the total population residing within 0.5 mile of each build alternative, and low-income individuals account for approximately 39 to 44 percent of the population in the same area. The study area for each build alternative has higher concentrations of low-income and minority persons than found within the surrounding jurisdictions (12 to 14 percent greater) or the Sound Transit service district as a whole (18 to 23 percent greater).

Given the overlap of potential construction limits of the Preferred and South 344th Street alternatives, demographic characteristics between these alternatives are nearly identical. The study areas represent between approximately 8,500 and 9,500 residents, and both have the same proportion of minority residents (66 percent) and relatively similar median household incomes, at approximately $51,000. However, the Preferred Alternative has slightly higher proportions of low-income individuals than the South 344th Street Alternative.

Table E.3-1 Comparison of Demographic Characteristics

	Preferred Alternative	South 344th Street Alternative	Midway Landfill Alternative	Sound Transit Service District	Federal Way	Kent	Des Moines
Total Population[1]	8,452	9,482	10,712	3,189,953	96,812	130,038	31,983
Minority Population[2]	66%	66%	68%	42%	57%	58%	48%
Low-Income Persons[3]	40%	39%	44%	21%	28%	30%	33%
Population under 5 years old	7%	7%	10%	6%	7%	7%	6%
Population over 64 years old	15%	15%	7%	13%	14%	11%	18%
Households with Limited English Proficiency[4]	18%	18%	15%	6%	9%	10%	5%
Median Household Income	$51,029	$51,580	$61,212	$96,803	$68,672	$73,891	$70,268

Source: U.S. Census Bureau, American Community Survey (ACS) 2016–2020 5-Year Estimates

Notes:

(1) Data represent the latest U.S. Census 5-year estimates based on 2016–2020 survey data. Survey data are not available at the census-block level; the data represent an estimate of minority and low-income persons in block groups within 0.5 mile of each project alternative.

(2) Minority is defined as all but Non-Hispanic White Alone.

(3) Low-income is defined as the percentage of a block group's population in households where the household income is less than or equal to twice the federal poverty level. This threshold is used by Sound Transit and other regional transit agencies to determine eligibility for reduced-fare programs and reflects the increasingly high cost of living in the region.

(4) Limited English proficiency refers to anyone above the age of 5 in households who reported speaking English less than "very well," as classified by the U.S. Census Bureau.

Table E.3-2 Comparison of Race and Ethnicity Characteristics

	Preferred Alternative	South 344th Street Alternative	Midway Landfill Alternative	Sound Transit Service District	Federal Way	Kent	Des Moines
Hispanic or Latino	21%	21%	30%	11%	17%	16%	20%
Black or African American	18%	18%	13%	7%	15%	12%	9%
Asian	18%	17%	14%	16%	14%	22%	16%
American Indian and Native Alaskan	<1%	<1%	<1%	1%	1%	<1%	3%
Native Hawaiian/ Pacific Islander	1%	2%	3%	1%	2%	2%	4%
Two or More Races and Other	7%	7%	8%	7%	7%	7%	7%

Source: U.S. Census Bureau, American Community Survey (ACS) 2016–2020 5-Year Estimates

The Midway Landfill Alternative in Kent has a higher proportion of low-income and minority residents compared to the two alternatives in Federal Way. The study area for the Midway Landfill Alternative represents approximately 10,700 residents. Of these residents, approximately 68 percent are reported as minorities, and 44 percent are reported as low-income. The Midway Landfill Alternative study area also reported the highest median household income of the three alternatives at approximately $61,000.

FIGURE E.3-6
Low-Income Populations
Midway Landfill Alternative

OMF South

ACS data report a 5-year average for a small sample size, which potentially results in high margins of error. To supplement the ACS demographic data, additional demographic data from public elementary schools within the study area were reviewed. Demographic information from local public elementary schools is used because the attendance boundaries are smaller than public middle and high schools, and they tend to approximate the boundaries of the study area more precisely.

The study areas for the Preferred and South 344th Street alternatives is entirely within the Federal Way School District, while the study area for the Midway Landfill Alternative is split between the Federal Way and Highline school districts. This assessment focuses on minority and low-income populations within the three elementary schools (Internet Academy, Sunnycrest Elementary, and Parkside Elementary) located within the study areas. Table E.3-3 summarizes environmental justice characteristics for elementary schools within the study area for each build alternative.

Table E.3-3 Public Schools within Build Alternative Study Areas

School Name	School District	Study Area	Total Students	Minority Population	Low Income Population
Internet Academy	Federal Way School District	Preferred and South 344th Street Alternatives	895	633 (71%)	507 (57%)
Sunnycrest Elementary	Federal Way School District	Midway Landfill Alternative	505	434 (86%)	402 (80%)
Parkside Elementary	Highline School District	Midway Landfill Alternative	415	346 (83%)	310 (75%)
Total Students			**1,815**	**1,413 (78%)**	**1,219 (67%)**

Source: Washington State Office of Superintendent of Public Instruction (OSPI), 2021-2022. Washington State Report Card.

The Internet Academy is a public virtual school that is part of Federal Way Public Schools and is located within the study areas for the Preferred and South 344th Street alternatives. The proportions of low-income and minority populations for the Internet Academy are higher than the populations present within the Preferred and South 344th Street alternatives study area based on ACS information (Table E.3-1). Parkside Elementary and Sunnycrest Elementary are located within the Midway Landfill Alternative study area. Similarly, the proportions of low-income and minority populations at both elementary schools are higher than the proportions of low-income and minority populations within the Midway Landfill Alternative study area based on ACS information (Table E.3-1). This suggests that low-income and minority populations may be more prevalent in these areas than indicated by ACS information.

3.2 Community Facilities

For the purpose of this environmental justice assessment, community facilities are defined as facilities that likely provide substantial services or assistance to minority and low-income populations. Examples include social and human health services, homeless shelters, affordable housing developments, schools, and places of worship. The specific community facilities identified within each study area for each OMF South project alternative are summarized in the Environmental Justice, Social Resources, Community Facilities, and Neighborhoods section of the Final EIS (Section 3.6). These resources are shown in Figures E.3-7 and E.3-8.

Social Resources
Midway Landfill Alternative
OMF South

The Preferred and South 344th Street alternatives have substantially more community facilities within their study areas than the Midway Landfill Alternative study area. Places of worship account for the majority of these facilities, including those that serve environmental justice populations. Based on communication with schools and social/human service organizations, these community facilities within the Preferred and South 344th Street alternatives study areas also serve low-income and minority individuals.

Affordable housing was identified in the study areas by reviewing information from the U.S. Department of Housing and Urban Development and King County Housing Authority to identify properties and housing developments that provide subsidized housing or housing assistance for low-income and cost-burdened families. Affordable housing in the study areas for the Preferred and South 344th Street alternatives includes Kings Court and Evergreen Court Apartments (each with 30 two- to three-bedroom units open to families, seniors aged 55 and over, and disabled persons). Affordable housing in the study area for the Midway Landfill Alternative includes Campus Court Apartments (12 three-bedroom units open to families, seniors aged 55 and over, and disabled persons) (King County 2024).

Additional nonsubsidized below-market-rate housing within the study area is available through private developments, such as apartment complexes, manufactured or mobile home developments, and RV parks. In the study areas of the Preferred and South 344th Street alternatives, these nonsubsidized below-market-rate housing developments include Meridian Court Apartments, Willamette Court Apartments, Villa Esperanza Apartments, Belmor Mobile Home Park (Belmor), Charwood Mobile Home Park, Celebration Senior Living, and Kitts Corner Apartments. In the study area for the Midway Landfill Alternative, these nonsubsidized below-market-rate housing developments include Green Acres Mobile Home Park, Mar Villa Mobile Home Park, Jackson Mobile Home Park, Tip Top Trailer Park, New Alaska Trailer Park, Midway Mobile Home/RV Park, and West Hill Mobile Home Park. These social resources are depicted in Figures E.3-7 and E.3-8 above.

4 OUTREACH TO MINORITY AND LOW-INCOME POPULATIONS

Sound Transit conducted public outreach during the OMF South early scoping period and throughout the State Environmental Policy Act (SEPA) and National Environmental Policy Act (NEPA) EIS processes and will continue to perform targeted outreach throughout the project development process.

Sound Transit is required to provide meaningful opportunities for minority, low-income, and limited-English-proficiency groups to engage in the planning process by (1) the agency's community engagement procedures, (2) EO 12898 and EO 14096, (3) U.S. DOT Order 5610.2C, and (4) FTA Circular C 4703.1. Title VI of the Civil Rights Act of 1964 prohibits discrimination based on race, color, or national origin. These directives make environmental justice a part of the decision-making process by identifying and addressing disproportionate and adverse human health and environmental effects of Sound Transit's programs, policies, and activities on minority and low-income populations.

Sound Transit conducted a preliminary demographic analysis to identify low-income, minority, and limited-English-proficiency populations. Based on this analysis, Sound Transit used the following strategies to engage these populations during the early scoping and scoping periods described below:

- Provided translated text on posters in Spanish, Korean, and Russian.
- Provided translated meeting handouts in Spanish, Korean, and Russian.
- Publicized events online and in print with language-specific media publications.
- Provided translated text on the online open house web pages as well as the embedded Google Translate tool, which can translate text into over 100 languages.

The following sections describe in more detail Sound Transit's outreach efforts to engage minority and low-income populations. The text also summarizes what Sound Transit heard from the community in response to the proposed project. All of the in-person outreach efforts described below offered opportunities for the public to engage with Sound Transit project staff to ask questions and offer ideas and comments. As the project moves forward, Sound Transit will continue to engage community leaders, jurisdictions, and social service providers to seek input, assess outreach methods, and identify additional ways to reach low-income, minority, and limited-English-proficiency populations. A summary of all public outreach efforts is documented in Appendix B, Public Involvement and Agency Coordination.

4.1 Scoping Outreach

4.1.1 Early Scoping

In March 2018, Sound Transit published the Tacoma Dome Link Extension and Operations and Maintenance Facility South Early Scoping Information Report (Sound Transit 2018). Early scoping was intended to initiate the public conversation before the start of environmental studies and was conducted for both projects concurrently. The public comment period for early scoping was from April 2 to May 3, 2018.

To support early scoping, Sound Transit held three community open houses in Tacoma, Federal Way, and Fife to ask for public, tribal, and agency input on the project's Purpose and Need statement, the Tacoma Dome Link Extension (TDLE) "representative project alignment" and other alternative alignments, and alternative locations for an OMF in the south corridor. All public meeting locations were accessible to persons with disabilities. Alternative formats and translation services were available. In addition, an online open house was available during the early scoping period to share information and receive feedback about the project using social media tools. All materials presented at the community open house were posted on the online open house.

Sound Transit advertised the community open houses through a variety of methods, including:

- Postcards to over 52,160 households and businesses, including both owners and renters
- Online and print advertisements in 12 publications, including RussianTownSeattle.com and KoreaTimes.com
- Posters at 150 locations in the corridor, including translated versions in Spanish, Korean, Vietnamese, Khmer, and Russian
- Two news releases and five email update notices to members of the public who signed up for updates on the project website
- Social media posts on Sound Transit’s Facebook account
- Project website

To reach minority populations, advertisements were published in El Siete Dias, Korea Daily, Korean Times Seattle, Northwest Vietnamese News, and Tu Decides.

In September 2018, Sound Transit conducted a series of stakeholder interviews, briefings, and tabling events around initial route and station concepts for TDLE. Although the OMF South project was not the focus of this outreach, Sound Transit presented information about OMF South, and staff were available to answer questions and provide updates about the project.

During the outreach associated with early scoping, Sound Transit received approximately 2,160 email comments between late January and early February 2019, prior to the start of the scoping period. Major themes for pre-scoping comments included opposition to the S 240th Street and SR 99 site, support for the Midway Landfill site, and concerns about business displacements and community impacts.

4.1.2 SEPA Scoping

Sound Transit initiated formal SEPA scoping for OMF South in early 2019. Unlike early scoping, which invited input on the OMF South and TDLE projects, the SEPA scoping process described here solely addressed the OMF South project.

During scoping, Sound Transit asked for comments on the proposed range of alternatives, the purpose and need for the project, environmental effects and benefits to be analyzed, probable significant adverse environmental impacts, potential mitigation measures, and permits, licenses, or other approvals that may be required. The comment period for scoping was from February 19 to April 1, 2019. This period exceeded the 30 days required under SEPA regulations and allowed additional time for public, agency, and Tribal comment.

During this period, two public scoping meetings were held to inform and obtain input from the community (one each in Federal Way and Kent). All public meeting locations were accessible to persons with disabilities. Alternative formats and translation services were available. Staff were present to share information, answer questions, and receive input, and written comment forms and computers were available to access the online comment form at the public scoping meetings, along with a court reporter who took verbal comments. In addition to the online open house, comments could be submitted through emails to the project scoping inbox (OMFsouthscoping@soundtransit.org), regular mail, and leaving voicemails on a transcription line. Buell Realtime Reporting is the professional service used to transcribe the voicemails.

Sound Transit advertised the in-person scoping meetings and online open house through a variety of methods, including:

- Newsletters to over 74,000 households and businesses, including both owners and renters
- Online and print advertisements in 10 publications, including Korea Daily and Tu Decides to reach minority populations
- Posters at over 300 locations in the corridor
- Two news releases and four email update notices
- Social media posts
- Project website

During the outreach associated with SEPA scoping phase, Sound Transit asked for comments on:

- Site options and locations
- Social, economic, environmental, and transportation impacts
- The draft Purpose and Need statement

Sound Transit received approximately 730 emails, 480 online open house communications, 180 in-person communications, 50 voicemail messages, and 20 letters. Within these communications, approximately 2,500 comment statements were made. The scoping summary report contains a full record of these comments. The report is available at https://www.soundtransit.org/get-to-know-us/documents-reports/operations-maintenance-facility-south-scoping-summary-report.

Comments related to low-income or minority populations included the following:

- The Federal Way Public Schools District asked that Sound Transit build the OMF South on one of the Midway Landfill sites to lessen community impacts, including those to residents, businesses, and faith-based organizations. The District noted that its students draw from a diverse community, with 60 percent qualifying for a free or reduced fee lunch and 20 percent who are learning English as a second language. The District asked Sound Transit to consider the impacts to these families in its analysis.
- About 185 comments mentioned employment, business, or economic-related impacts. Several comments expressed concern about business and job displacements, the relative cost of OMF site alternatives, and impacts to planned economic growth in the South Sound.
- About 40 comments were concerned with potential impacts to low-income populations and displacement of affordable housing by the OMF sites. Additionally, some potentially impacted businesses submitted comments concerning financial hardships that might occur if they were relocated.
- South 240th Street and SR 99 site: Commenters were concerned about impacts to nearby small businesses and affordable housing, including the Midway Mobile Home Park, and how their removal would affect low-income populations. About 150 comments concerned impacts to Highline College and its students, and about 20 comments involved the

displacement of the mobile home park. This site alternative was not carried forward for further consideration.

- South 316th Street and Military Road site: Many commenters were concerned about residential displacements and neighborhood impacts. Comments mentioned zoning inconsistencies and noise concerns in a residential area, in addition to displacement of low-income or minority populations. This site alternative was not carried forward for further consideration.

In the fall of 2020, Sound Transit conducted several stakeholder interviews with representatives of social service agencies and community groups to solicit input on how to best communicate with them in the future. These agencies and community groups included the Federal Way Black Collective, the Voice of Hope Church, the KAC Baptist Church, and the Multi-Service Center in Federal Way.

Sound Transit conducted focused OMF South outreach in November and December 2019, which included a series of drop-in presentations and engagement sessions to provide the public with opportunities to learn more about the OMF South project and offer suggestions on how public engagement could be improved. Sound Transit also launched an online open house and survey for the project, which was available from November 13 through December 6, 2019. The online open house site included a landing page translated into Khmer, Korean, Russian, Spanish, and Vietnamese, with instruction on how to use Google Translate to navigate the site. The site also included content in each of these languages.

4.2 2021 SEPA Draft EIS Outreach

In conjunction with the release of the 2021 SEPA Draft EIS, Sound Transit hosted an online open house between March 5 and April 19, 2021. Information presented on the online open house website included project background and history, details about the environmental review process, analysis of the three OMF South build alternatives with maps and statistical comparisons, and the project timeline. The online open house was fully translated into Spanish, Korean, and Russian and included the Google Translate function so users could translate webpage text into additional languages. Users were able to submit a comment on the 2021 SEPA Draft EIS findings via a comment from on the online open house.

In addition to the online open house, Sound Transit hosted two online public hearings during the 45-day comment period. The hearings provided attendees the opportunity to engage with Sound Transit staff, submit written questions for answers from a panel of Sound Transit staff, or provide verbal public comments on the 2021 SEPA Draft EIS. While all members of the public were invited to provide comments, in an effort to center equity and provide access to people who have historically been excluded from public processes, Sound Transit invited attendees who identified as people of color, people with disabilities, and anyone working with an interpreter the opportunity to speak first before opening the floor to the rest of the attendees.

Sound Transit received, in total, approximately 280 communications during the 2021 SEPA Draft EIS comment period. A majority of these communications were from the general public, and the remainder were from government sources, such as Tribes, agencies, jurisdictions, and elected officials, and from affected businesses and community groups.

Most of the communications from the public expressed a preference for or against a specific alternative site. In general, most comments supported the Midway Landfill Alternative and/or opposed the South 344th Street Alternative. The most common general themes in the public comments, outside of statements for or against a particular alternative, concerned impacts to the community or neighborhood due to displacements of residents, businesses, and employees as well as impacts to natural resources such as streams, wetlands, and habitat.

After the end of the comment period, Sound Transit collected and considered the comments received and prepared a Comment Summary Report (Sound Transit 2021). After considering the potential impacts disclosed in the 2021 SEPA Draft EIS and the comments received from Tribes, agencies, and the public, including the Environmental Justice Analysis, the Sound Transit Board of Directors identified the South 336th Street Alternative as the Preferred Alternative (Motion M2021-81, December 2021).

4.3 NEPA Scoping

FTA and Sound Transit published a NEPA Notice of Intent in the Federal Register on July 19, 2023. The notice initiated a 30-day comment period where agencies, Tribes, and members of the public were invited to comment on the proposed scope of the NEPA EIS, particularly on changes made to the proposal since the 2021 SEPA Draft EIS.

The only substantive comment related to low-income and minority populations received during scoping was from EPA, which concerned guidance on the methods and tools used to produce the environmental justice assessment. Specifically, EPA encouraged the use of EJScreen, which is EPA's environmental justice screening and mapping tool. EPA also provided recommendations specific to the Comprehensive Environmental Response, Compensation, and Liability Act, climate change, air and water quality, and water resource impacts.

4.4 2023 NEPA Draft/SEPA Supplemental Draft EIS Outreach

The NEPA Draft/SEPA Supplemental Draft EIS was published on September 22, 2023. There was a 45-day comment period, during which Tribes, agencies, and members of the public were invited to comment. The comment period ended November 6, 2023. Comments are summarized in Chapter 5, Comment Summary, of the Final EIS, and the full text of the comments received and the responses are in Appendix L, Comments and Responses, of the Final EIS.

Public engagement for the comment period included an online open house that lasted the duration of the comment period. The public could visit the website to review what had changed since the 2021 SEPA Draft EIS, review a summary of the findings of the NEPA Draft/SEPA Supplemental Draft EIS and supporting materials, along with submitting comments via an online comment form. In addition to English, the website was also available in Korean, Russian, and Spanish. The website contained accessibility features including screen reader-friendly content and detailed alternative text. Digital factsheets and documents throughout the site were made into accessible PDFs. A total of 1,321 people visited the online open house including:

- 1,241 visitors to the English site
- 72 visitors to the Spanish site
- Two visitors to the Korean site
- Six visitors to the Russian site

Additionally, there were two public meetings: one in-person and one online. The first portion of the meetings included a presentation from Sound Transit staff followed by a live question-and-answer segment. In addition, the in-person meeting began with an open-house format for attendees to engage with Sound Transit staff. The second portion was a public hearing that allowed participants to formally provide comments on the Draft EIS. The comments were captured by a court reporter. Both meetings used standard accessibility features. The online meeting featured live captioning (in English) and was screen-reader accessible. Sound Transit offered simultaneous interpretation in American Sign Language, Spanish, Korean, and Russian at the online and in-person meetings. The in-person meeting also included translated materials in Spanish, Korean, and Russian. Sound Transit staff communicated the language and accessibility features throughout the public meetings and hearings to ensure attendees understood how to fully participate. Languages available for interpretation were based on the demographic data of the study area.

FTA and Sound Transit received a total of 58 communications during the comment period. As before, most commenters were members of the general public. The most common general themes in the public comments, outside of statements for or against a particular alternative, concerned impacts to the community or neighborhood due to displacements of residents, businesses, and employees as well as impacts to natural resources, such as streams, wetlands, and habitat.

4.5 Additional Targeted Outreach and Community Feedback

As part of the environmental review process, Sound Transit prioritized and targeted outreach to populations that have been historically underrepresented in previous public engagement processes. In 2021 and 2023, Sound Transit partnered with community-based organizations to distribute information regarding the Draft EISs and request quality control for translated content.

Organizations that Sound Transit has partnered with include El Centro de la Raza, Voice of Hope Church, Federal Way Black Collective, Korean Women’s Association, the Multi-Service Center, KAC Baptist Church, and Centro Rendu. Project materials, including the online open house, the guide to the Draft EIS, and comment forms, were fully translated into Spanish, Korean, and Russian to ensure language access. Interpretation in Spanish, Korean, and Russian was provided for the online public meetings and hearing.

The OMF South project team attends events held by community organizations in the project area to connect with audiences that may not receive project information otherwise. By attending these events, Sound Transit builds relationships and establishes an ongoing presence in communities in the project area, provides project information and answers questions, and offers ways to stay engaged through project email updates. The project team has focused on attending events in traditionally underserved communities and providing in-language project information. Examples include the Kent Farmers Market and the Federal Way Farmers Market.

Outreach and engagement with property owners has occurred throughout the environmental review process. In 2019 and 2020, Sound Transit distributed fliers to businesses and residential homes neighboring the proposed OMF South site alternatives to provide them with information about the OMF South project. In early January 2021, Sound Transit mailed a letter to potentially affected property owners. The letter notified each property owner of potential effects to their property and offered to meet with them. Information provided at a briefing for property owners included an overview of the project background, environmental review process, and property acquisition and relocation process. The project team called potentially affected businesses to offer briefings to learn more about the project, the property acquisition and relocation process, and how to comment on the 2021 SEPA Draft EIS.

Sound Transit has continued to meet with potentially affected and neighboring property owners to answer questions regarding current designs and continues to offer briefings upon request. Project representatives also met with the following property owner groups to provide project updates and answer questions:

- Belmor leadership and residents
- Pacific Christian Academy
- Christian Faith Center
- KAC Baptist Church
- GarageTown

The primary topics heard through these outreach efforts were around the opportunity for living-wage jobs and concerns over impacts to businesses, employees, and residents. Other comment themes included concerns about noise and vibration impacts along the proposed mainline guideway, effects on social and community cohesion, and concerns about construction duration and extent of impacts.

Sound Transit has and continues to meet regularly with residents of Belmor, which is a residential mobile home community potentially impacted by the OMF South project. The community engagement team has provided four separate briefings to residents and sent multiple mailers during formal comment periods, including mailings to advertise resident briefings, a frequently asked questions flyer to respond to common concerns around the project process and relocation, and notifications regarding potential early acquisition of a portion of the mobile home park.

In these meetings, the residents have been provided information on the OMF South project, potential site selection, the EIS, and the acquisition and relocation process. As some mobile homes would be acquired by Sound Transit as real property, these briefings have primarily centered on the acquisition and relocation process, including how displaced residents would have a fully dedicated assigned agent working with them throughout the process. In addition to the scheduled briefings, many more individuals have contacted Sound Transit’s Community Outreach Team via email and letters to inquire about the project and potential impacts to their community.

Feedback heard during engagement with the Belmor community included:

- Questions on why Sound Transit identified a route that will impact so many senior citizens on fixed incomes
- Questions about which units would be displaced
- Concern about losing access to the golf course and other Belmor amenities
- Changes to OMF South project schedule, which makes people feel more in limbo and “trapped”
- Concerns about where residents would be able to afford to move
- Concerns from some residents about having mortgages and new mobile homes
- Concerns that some of the older mobile home units (built in the 1970s or earlier) are either not eligible or feasible to be moved
- Concerns about the park ownership (Hynes Group) not communicating with the residents

5 PROJECT IMPACTS, BENEFITS, AND MITIGATION

Section 5.1 summarizes the potential for adverse effects on minority or low-income populations for the project alternatives along with potential avoidance, minimization, and mitigation measures specific to those impacts. Sections 5.2 through 5.4 describe indirect impacts, cumulative impacts, and project benefits, respectively.

5.1 Direct Impacts and Mitigation Measures

5.1.1 No-Build Alternative

Under the No-Build Alternative, no impacts from the project to environmental justice populations are expected and benefits to environmental justice populations would not occur. For the purposes of the Final EIS, the No-Build Alternative assumes that by the design year 2042, FWLE and all planned Sound Transit 3 projects, including TDLE, are built along with the other public and private projects planned within the study area. If TDLE is constructed as proposed, the mainline track associated with the Preferred and South 344th Street alternatives would be built later in time.

Under the No-Build Alternative, Sound Transit would not have the capacity to receive, test, commission, store, maintain, and deploy the expanded fleet of LRVs needed to support existing and planned future expansions of the Link light rail system at planned service levels under Sound Transit 3. As a result, light rail operations would be less efficient than they would otherwise be with the facility, and Sound Transit would not be able to meet the expected ridership demand.

Reduced service levels would limit benefits to environmental justice populations who use the system. Based on 2018–2019 survey data, approximately 43 percent of Sound Transit ridership across all modes (Link light rail, Regional Express bus, and Sounder) are minorities, many of whom use transit for more than commuting purposes. Approximately 22 percent of minority riders and 13 percent of non-minority riders made less than $33,000 annually, indicating the importance of transit availability to lower income riders.

5.1.2 Build Alternatives

For the project alternatives analyzed in the Final EIS, Table E.5-1 summarizes impacts, mitigation measures, and where project impacts and benefits would affect minority and low-income populations. As shown in Table E.5-1, the project would not adversely impact many elements of the environment. These elements are not further analyzed. For elements of the environment where the project potentially causes adverse effects to minority and low-income populations, a more detailed discussion of the potential impacts and avoidance, minimization, and mitigation measures for these resources is provided in sections below the table (Section 5.1.2.1, Transportation; Section 5.1.2.2, Acquisitions, Displacements, and Relocations; Section 5.1.2.3, Economics; Section 5.1.2.4, Visual and Aesthetic Resources; and Section 5.1.2.5, Social Resources, Community Facilities, and Neighborhoods). All identified project impacts have proposed in-kind mitigation measures. Further information can be found in Chapter 3 of the Final EIS (Affected Environment, Environmental Impacts, and Mitigation Measures).

Table E.5-1 Summary of Potential Impacts and Mitigation

Type of Impact	Impact Summary for Build Alternatives	Mitigation Summary	Impacts on Minority and Low Income Populations	Benefit(s) to Minority and Low Income Populations
Transportation[1]	• No long-term impacts on freight, transit, parking, or nonmotorized facilities are anticipated. • The alignment of the mainline tracks for the Preferred and South 344th Street alternatives would be constructed immediately adjacent to the southbound I-5 clear zone within the I-5 right-of-way. While portions of the mainline alignment would maintain clear zone standards, there may be locations where the minimum widths cannot be met. • All the build alternatives would require demolition activities and earthwork that would generate truck trips during the construction effort. Depending on the subsurface construction design option chosen, the Midway Landfill Alternative could require up to 564 round trip truck trips per day during the most intense periods of site preparation activities.	• There would be avoidance and minimization measures to address potential traffic congestion during construction, such as developing a traffic management plan and avoiding traffic disruptions during peak travel times. • In locations where the mainline tracks for the Preferred and South 344th Street alternatives reduce the available clear zone below standards, Sound Transit would reestablish a clear zone by regrading or installing guardrails, barriers or impact attenuators. These measures would not adversely affect transportation safety in the study area.	• There are no adverse transportation impacts expected for the Preferred and South 344th Street alternatives. • Construction truck trips would be substantially greater for the Midway Landfill Alternative, which has a high percentage of environmental justice populations within its study area. • While I-5 and the arterials surrounding the Midway Landfill Alternative have the capacity to accommodate the additional truck traffic, the large number of daily truck trips over several years necessary for site preparation could exacerbate existing traffic congestion along some roadway segments and be perceived by the community as an adverse impact. • Construction traffic could cause noise and visual impacts to residents adjacent to the project site and haul routes. See the Visual and Aesthetics Resources and Noise and Vibration sections of this table for more detail.	• OMF South would support the system-wide expansion of light rail as called for in the Sound Transit 3 plan, including expansion into the south corridor from Federal Way to Tacoma. As a result, improved regional connectivity and mobility would accrue to a larger extent for minority and low-income residents as a primary and affordable means of transportation. • The Preferred Alternative would replace 20th Avenue S with an extension of 18th Place S, which would include a multi-use path for pedestrians and bicyclists.

Notes:

(1) See Section 5.1.2.1 for more detail on transportation impacts and mitigation.

Table E.5-1 Summary of Potential Impacts and Mitigation (continued)

Type of Impact	Impact Summary for Build Alternatives	Mitigation Summary	Impacts on Minority and Low Income Populations	Benefit(s) to Minority and Low Income Populations
Acquisitions, Displacements, and Relocations[2]	OMF South would acquire public and private property for the mainline track and OMF site. As a result of these acquisitions, some residences, businesses, and public uses would be displaced. • Preferred Alternative with 40 mph Alignment displacements: 86 residences, 11 businesses, and 1 religious facility. • Preferred Alternative with 55 mph Design Option displacements: 92 residences, 11 businesses, and 1 religious facility. • South 344th Street Alternative with 40 mph Alignment displacements: 91 residences, 17 businesses, and 4 religious facilities. • South 344th Street Alternative with 55 mph Design Option displacements: 97 residences, 17 businesses, and 4 religious facilities. • Midway Landfill Alternative displacements: 4 businesses, 0 residences, and 0 religious facilities; the least impacts of all alternatives. Most of the residential displacements for the Preferred and South 344th Street alternatives would be mobile homes at Belmor.	• Consistent with the Uniform Relocation Act, residents and businesses displaced by the project would receive compensation and relocation assistance in accordance with Sound Transit's adopted real estate property acquisition and relocation policy, procedures, and guidelines (Sound Transit 2002 and 2011). • There may be opportunities for relocation of some residents, social resources, and businesses in the project vicinity, including limited relocation opportunities within Belmor for residents of the potentially impacted mobile home park. • For residential relocations, Sound Transit relocation specialists would work with affected residents to help them relocate nearby to a dwelling that is as comparable to their current dwelling as possible. • Sound Transit would ensure that comparable housing is made available, whether the displaced resident owns or rents their home. Aside from the level of advisory services required by each displaced resident, the mitigation provided to these populations would be the same as for the general population, regardless of low-income or minority status. Compensation for rent differentials includes additional considerations for low-income households.	• Minority and low-income populations would be impacted by the acquisition, displacement, and relocation of residences and businesses. Sound Transit would ensure that comparable housing is made available, whether the displaced resident owns or rents their home.	• None.

Notes:

(2) See Section 5.1.2.2 for more detail on acquisitions impacts and mitigation.

Table E.5-1 Summary of Potential Impacts and Mitigation (continued)

Type of Impact	Impact Summary for Build Alternatives	Mitigation Summary	Impacts on Minority and Low Income Populations	Benefit(s) to Minority and Low Income Populations
Land Use	• All alternatives would require acquisitions and conversion of existing land uses (commercial, single-/multi-family residential, public/institutional, vacant) to a transportation-related land use. • Construction activities would not affect land use patterns in the study area.	• No mitigation would be required.	• No impacts.	• None.
Economics[3]	• Direct economic impacts include business and employee displacements, associated potential tax impacts, and changes in development patterns and regional freight mobility. • The Preferred Alternative would result in 12 business (including religious facilities) displacements and 126 employee displacements[4]. • The South 344th Street Alternative would result in 21 business displacements (including religious facilities) and 212 employee displacements. • The Midway Landfill Alternative would result in 4 business displacements and 43 employee displacements. • Construction activity may disrupt current economic activity by increasing traffic delays and may result in other negative impacts, such as increased noise adjacent to the construction site. • Construction would bring revenue into the economy with the jobs that it produces, and the money spent by the construction employees in the surrounding community.	• Long-term operation of OMF South is not anticipated to result in adverse economic effects that would require mitigation. • Relocation assistance for business displacements is discussed in Final EIS Section 3.3, Acquisitions, Displacements, and Relocations. • Construction mitigation plans would be developed to address the needs of businesses that may be affected during construction.	• Based on the demographic characteristics of the study areas, some displaced businesses are likely minority owned and include minority and/or low-income employees.	• By supporting the development of light rail service, OMF South indirectly provides improved access to employment centers and expanded employment opportunities for minority and low-income persons residing in the project corridor and the Puget Sound region. • Project would result in the creation of approximately 610 permanent living-wage jobs at the OMF site and would include classroom space to be compatible with future apprentice programs. • Construction could generate $3.2 billion to $6.8 billion in economic output and support hundreds of jobs throughout the region. Sound Transit includes project labor agreements and has a DBE program to support hiring persons of color, with a goal to eliminate barriers, create opportunities, and build capacity for underrepresented and women-own businesses.

Notes:

(3) See Section 5.1.2.3 for more detail on economic impacts and mitigation.

(4) The number of displaced employees is based on the business building size (King County Department of Assessment data) and the type of business activity using square-foot-per-employee factors from the U.S. Department of Energy and the Institute for Transportation Engineers and not on an actual survey of businesses. The analysis for estimating employees assumes that the businesses are not abandoned or vacant.

Table E.5-1 Summary of Potential Impacts and Mitigation (continued)

Type of Impact	Impact Summary for Build Alternatives	Mitigation Summary	Impacts on Minority and Low Income Populations	Benefit(s) to Minority and Low Income Populations
Social Resources, Community Facilities, and Neighborhoods[5]	• All OMF South build alternatives include residential and commercial property acquisitions and land use conversions. • The Preferred Alternative would displace residential units within Belmor, disrupting social cohesion. It would also adversely affect social resources, including displacement of the Christian Faith Center, which includes a child-care center and the Pacific Christian Academy school, and 11 businesses, including a home-based daycare. • The South 344th Street Alternative would have the most impacts on social resources of the build alternatives. It would have the same impacts as the Preferred Alternative on Belmor and would also displace 4 religious facilities and 17 businesses. • The Preferred Alternative and the South 344th Street Alternative with the 40 mph Alignment would relocate one golf hole and shorten the associated fairway at the northeast corner of the Belmor private golf course. The 55 mph Design Option would affect an additional hole and associated fairway. Both mainline design options would also alter the golf course path. • The Midway Landfill Alternative would displace 4 businesses. • Community resources and neighborhoods in proximity to construction activities would be impacted by increased truck traffic, localized impacts to air and visual quality, and increased noise and vibration.	• Specific design features, BMPs, and mitigation measures would be used to minimize adverse impacts to social resources, community facilities, and neighborhoods. • Generally, Sound Transit identified that there is a sufficient supply of housing in the study area and adequate space to relocate religious facilities, childcare centers, and other businesses that serve environmental justice populations. • Access to community facilities would be maintained during construction to the extent practicable. • Sound Transit would relocate the golf hole(s) and golf course path. • Avoidance, minimization, and mitigation measures for long-term operational and short-term construction impacts, including transportation, visual, air, and noise impacts, are described under elements of the environment in in this table.	• Based on the demographic characteristics of the corridor, all build alternatives would displace businesses that serve or employ minority or low-income populations. • The Preferred and South 344th Street alternatives would displace social resources, including religious institutions that serve low-income and minority populations in the study area. • The Preferred Alternative would displace the Christian Faith Center and an associated school and childcare center, which would be challenging to relocate due to its size. • The Preferred Alternative would displace a home-based daycare that offers subsidized childcare and dual language programs.	• Public space on the north side of the Preferred Alternative along S 336th Street to be developed in coordination with the city of Federal Way would include amenities such as multi-use path, seating, landscaping, artwork, and educational signage. • A multi-use path along the extension of 18th Place S for the Preferred Alternative would allow for community connectivity and two-way travel by people walking, rolling, and biking that would be separated from the road by a curb and planting strip.

Notes:

(5) See Section 5.1.2.5 for more detail on social resource impacts and mitigation.

Table E.5-1 Summary of Potential Impacts and Mitigation (continued)

Type of Impact	Impact Summary for Build Alternatives	Mitigation Summary	Impacts on Minority and Low Income Populations	Benefit(s) to Minority and Low Income Populations
Visual and Aesthetic Resources[6]	• All the build alternatives would change visual conditions by removing existing landscape features and constructing new buildings, retaining walls, and elevated structures. • Preferred and South 344th Street alternatives: Belmor residents near the mainline would experience adverse visual impacts. • Preferred and South 344th Street alternatives: residents along 24th Avenue S would experience adverse visual impacts • The South 344th Street Alternative tail tracks would impact WSDOT Resource Conservation Areas adjacent to the I-5 right-of-way. • Midway Landfill Alternative: residents north and south of the site could experience adverse visual impacts. • Construction could result in a temporary decrease in visual quality.	• Preferred and South 344th Street alternatives: planting of trees and shrubs and architectural treatment of walls would soften visual impacts of the mainline through Belmor and along 24th Avenue S. • Sound Transit would consult with WSDOT and FHWA to develop site-specific measures for impacts to WSDOT Resource Conservation Areas along I-5 through replacement property or other measures. • Midway Alternative: existing fencing and vegetation along with new landscaping would screen views of OMF South for nearby residents.	• There is a high percentage of low-income (56 percent) and minority populations (87 percent) in the block group encompassing the residents along 24th Avenue S. The residents would experience high visual impacts from the Preferred and South 344th Street alternatives from the removal of trees and vegetation and the addition of large-scale project features • There is a high percentage of low-income (34 percent) and minority populations (68 percent) in the block group encompassing the residents north and south of the Midway Landfill Alternative. These residents would experience moderate visual impacts from the Midway Landfill Alternative site. • Construction activities, including truck traffic, could result in temporary decreases in visual quality.	• None.
Air Quality and Greenhouse Gases	• Long-term emissions associated with employee commutes, material deliveries, and on-site vehicle maintenance are not anticipated to exceed air quality standards. • During construction, short-term degradation of air quality may occur due to the release of particulate emissions generated by excavation, grading, hauling, and other activities.	• Sound Transit would implement construction BMPs to minimize the impact of construction-related emissions and nuisance dust on existing residential and recreational uses.	• No adverse impacts.	• None.

(6) See Section 5.1.2.4 for more detail on visual and aesthetic resource impacts and mitigation.

Table E.5-1 Summary of Potential Impacts and Mitigation (continued)

Type of Impact	Impact Summary for Build Alternatives	Mitigation Summary	Impacts on Minority and Low Income Populations	Benefit(s) to Minority and Low Income Populations
Noise and Vibration	• There are no FTA noise impacts or WAC exceedances associated with operation of any of the OMF sites. • Preferred and South 344th Street alternatives: both mainline alignments would result in vehicle traffic noise impacts from removal of the berm along I-5 for about one to three residences. • Preferred and South 344th Street alternatives: The mainline 55 mph Design Option would result in noise impacts to four single-family residences in Belmor for both the Preferred and South 344th Street alternatives. • There are no vibration impacts associated with operation of any of the build alternatives. • Construction may result in temporary noise and vibration impacts for all build alternatives. • Residences at Belmor may experience temporary vibration impacts depending on construction methods used for the Preferred and South 344th Street alternatives.	• In accordance with the Sound Transit Link Noise Mitigation Policy, the project would mitigate all noise and vibration impacts with noise walls or other measures. Based on the current design, noise impacts along the mainline through Belmor would be mitigated with a noise wall. • A construction management plan would be developed during the design phase of the project detailing BMPs to minimize impacts on local businesses and residents, including noise and vibration impacts.	• After mitigation, there would be no operational noise impacts from the project. • Minority and low-income people within close proximity to construction activities would experience temporary noise and vibration impacts during construction.	• None.
Ecosystem Resources	• All build alternatives would have direct long-term impacts on ecosystem resources where permanent features, such as project facilities, overlap ecosystem components, such as wetlands, wetland buffers, streams, stream buffers, or native forest. • Temporary construction-related impacts would occur where wetlands, wetland buffers, streams, stream buffers, or native forest are affected by clearing and ground-disturbing work and would be revegetated following construction.	• For unavoidable long-term impacts on wetlands, streams, and their buffers, Sound Transit would develop compensatory mitigation during the permitting phase in accordance with applicable federal, state, and local requirements and guidelines. That could include onsite restoration, replacement sites, and the use of the King County In-Lieu Fee Program or other approved mitigation banks.	• No adverse impacts.	• None.

Table E.5-1 Summary of Potential Impacts and Mitigation (continued)

Type of Impact	Impact Summary for Build Alternatives	Mitigation Summary	Impacts on Minority and Low Income Populations	Benefit(s) to Minority and Low Income Populations
Water Resources	• All build alternatives would add both pollution-generating impervious surfaces and non-pollution-generating impervious surfaces in the study areas for all project alternatives and would require stormwater management BMPs, such as flow control or treatment. • Construction of all build alternatives could affect surface and groundwater quality by increasing flooding or erosion or cause potential degradation of water quality when runoff is generated in construction areas.	• With the application of required stormwater BMPs, such as flow control or treatment facilities, no temporary or long-term adverse impacts on water resources are expected and no mitigation would be required. • Stormwater pollution prevention and sediment and erosion control plans would be developed that would specify BMPs for managing water runoff, protecting water quality, and preventing erosion	• No adverse impacts.	• None.
Geology and Soils	• The project would be designed to meet current seismic standards and to address any concerns over slope stability, minor settlement, and corrosive soils to prevent long-term impacts. • Construction impacts could include erosion of soils within the construction area and potential impacts on shallow groundwater quality from construction activities that would be addressed with standard BMPs.	• No mitigation would be required.	• No adverse impacts.	• None.

Table E.5-1 Summary of Potential Impacts and Mitigation (continued)

Type of Impact	Impact Summary for Build Alternatives	Mitigation Summary	Impacts on Minority and Low Income Populations	Benefit(s) to Minority and Low Income Populations
Hazardous Materials	• For all build alternatives, operation of the project could cause long-term impacts on the environment if an accidental release of hazardous materials occurs, such as a fuel spill. • Construction impacts of the Midway Landfill Alternative could include the potential release of contaminated air, soil, and groundwater due to its characterization as a high-risk hazardous materials site.	• Mitigation would be required for construction of the Midway Landfill Alternative, which would include replacement of the landfill cap and other measures.	• Minority and low-income residents adjacent to the construction of the Midway Landfill Alternative could be exposed to the release of contaminated air, soil, and groundwater, due to the landfill's characterization as a high-risk hazardous materials site. Census data indicate that there is a higher percentage of low-income (34 percent) and minority (68 percent) population immediately adjacent to the site than the Sound Transit service district average.	• None.
Public Services	• OMF South is not anticipated to result in adverse impacts to public services.	• No mitigation would be required.	• No adverse impacts.	• None.
Utilities, Energy, and Electromagnetic Fields	• OMF South operation would not result in any long-term adverse impacts to existing utilities in the project corridor. • Construction could result in temporary impacts such as service disruptions due to utility relocations. • There are no potential or adverse electromagnetic field impacts in the study area. • No adverse impacts on energy are anticipated.	• Temporary utility impacts would be avoided or minimized by maintaining required access to utilities and through communication with customers to inform them of planned or potential service disruptions. No mitigation would be required.	• OMF South would not result in any long-term adverse impacts to existing utilities. • Minority and low-income residents within the vicinity of the project could experience temporary service disruptions due to utility relocations.	• None.
Historic and Archaeological Resources	• None of the build alternatives are anticipated to have impacts on historic or archeological resources.	• No mitigation would be required.	• No adverse impacts.	• None.

Table E.5-1 Summary of Potential Impacts and Mitigation (continued)

Type of Impact	Impact Summary for Build Alternatives	Mitigation Summary	Impacts on Minority and Low Income Populations	Benefit(s) to Minority and Low Income Populations
Parks and Recreational Resources	• None of the build alternatives would have long-term impacts on public parks or other public recreation facilities within the study area. • There would not be any direct construction impacts to parks or recreational facilities, but construction of the mainline tracks for the Preferred and South 344th Street Alternatives could cause temporary light, noise, and dust impacts to Cedar Grove Park.	• Construction impacts would be addressed through public outreach and other BMPs to maintain access and minimize light, noise, and dust impacts. No mitigation would be required.	• There would be no long-term adverse impacts on public parks or other public recreational facilities within the study area. • Construction of the mainline tracks for the Preferred and South 344th Street Alternatives could cause temporary light, noise, and dust impacts to Cedar Grove Park, or affect access due to temporary detours, lane closures, or other traffic impacts.	• None.
Section 4(f) and 6(f) Resources	• None of the alternatives would acquire land from or result in the use of any recreational 4(f) or 6(f) resources. • FTA determined that the mainline for the Preferred or South 344th Street alternative would have a *de minimis* impact to the BPA powerlines, which have been determined eligible for the National Register of Historic Places.	• No mitigation would be required.	• No adverse impacts.	• None.

Notes:

BMP = best management practice; BPA = Bonneville Power Administration; DBE = Disadvantaged Business Enterprise; FHWA = Federal Highway Administration; FTA = Federal Transit Administration; I-5 = Interstate 5; OMF = operations and maintenance facility; WSDOT = Washington State Department of Transportation

The following sections focus on the five elements of the environment that would potentially impact environmental justice populations that are identified in Table E.5-1: Transportation; Acquisitions, Displacements, and Relocations; Economics; Visual and Aesthetic Resources; and Social Resources, Community Facilities, and Neighborhoods.

To better understand the demographics of the populations that would be impacted by the project, Sound Transit identified the block groups in which quantifiable impacts would occur. Tables E.5-2 through E.5-4 list the block groups in the study area for each alternative, the percent of minority and low-income populations within each block group, and the potential displacements and visual impacts in each block group. Figures E.3-1 through E.3-3 show the block groups in the study area for each alternative.

Displacements and visual impacts for the Preferred and South 344th Street alternatives occur in three block groups: 530330303131, 530330303132, and 530330303133. As all block groups in this analysis start with the same six digits (530330), the text will herein refer to the block groups without the repeating digits for readability.

The majority of residential displacements (about 83 percent) for the Preferred and South 344th Street alternatives occur in Block Group 303131, within which the proportion of minority and low-income population is similar to the Sound Transit service district average. The remaining residential replacements are within Block Groups 303132 and 303133, which have a higher proportion of minority and low-income populations relative to the Sound Transit service district average. All business and community facility displacements occur in block groups with a higher proportion of low-income and minority populations than the Sound Transit service district average. Most of the businesses displaced by the Preferred and South 344th Street alternatives serve an area larger than the study area, such as the greater Federal Way or Puget Sound area, and some have multiple locations, as described further in Section 5.1.2.3, Economics.

High visual impacts from the Preferred and South 344th Street alternatives would occur along 24th Avenue S in Block Group 303132, which has a higher percentage of low-income and minority populations than the Sound Transit service district. Other high visual impacts would occur in Block Group 303131, which has similar low-income and minority populations as the Sound Transit service district average.

Displacements for the Midway Landfill Alternative are all within Block Group 290041. This block group has a higher percentage of minority and low-income population than the Sound Transit service district average. There are no high visual impacts associated with this alternative. Moderate visual impacts would occur north and south of the site, where there is a higher percentage of low-income and minority populations. Construction traffic impacts from the Midway Landfill Alternative are not shown in the table due to the dispersed nature of the impact; these impacts are described further in Section 5.1.2.1, Transportation.

5.1.2.1 Transportation

Long-term transportation impacts are relatively similar for all three build alternatives; however, construction impacts would differ. During construction, each build alternative would require some preparatory demolition and earthwork that would generate truck trips in addition to material delivery and general construction vehicle activity throughout the duration of construction. Most construction-period traffic would occur during import and export of material to and from the site during site preparation. The Preferred and South 344th Street alternatives would require similar peak daily truck trips during construction. However, the Midway Landfill Alternative would require up to nearly three times the number of truck trips, depending on the subsurface construction design option.

Additionally, construction duration varies between the Preferred and South 344th Street alternatives and the Midway Landfill Alternative. For the Preferred and South 344th Street alternatives, site preparation would take approximately 1 year and 6 months, assuming 12-hour workdays, 6 days per week. For the Midway Landfill Alternative, site preparation could take up to 5 years and 7 months, using the same assumptions.

The extensive site preparation work required for the Midway Landfill Alternative subsurface construction design options would expose the residents within the study area, which has a higher concentration of environmental justice populations than the surrounding community, to construction impacts over a longer period of time. In particular, it would result in higher volumes of construction traffic for exporting and importing the vast quantities of fill material. While I-5 and the arterials surrounding the Midway Landfill Alternative should accommodate the additional truck traffic, the substantial number of daily truck trips necessary for those subsurface construction design options could exacerbate existing congestion in some locations and be perceived as an adverse impact.

Avoidance, Minimization, and Mitigation

OMF South is not anticipated to result in long-term or construction impacts to freight, transit, nonmotorized transportation, or parking. Therefore, no mitigation for those transportation elements is proposed. However, there would be avoidance and minimization measures to address potential traffic congestion during construction, such as developing a traffic management plan and avoiding traffic disruptions during peak travel times.

For all build alternatives, a construction transportation management plan would be developed to address potential traffic and transportation impacts to the community, including minority and low-income populations. The plan would address site access, traffic control, hauling routes, impacts to transit, construction employee parking, impacts to local businesses, and pedestrian and bicycle control in the area. It would be prepared per city of Federal Way or city of Kent requirements and in coordination with WSDOT and FHWA, as applicable. Sound Transit would strive to maintain access to all properties as needed. However, if temporary driveway closures are required, access to these properties would be maintained to the extent practical through alternative routes. If access to a business could not be maintained during construction, the specific construction activity would be reviewed to determine whether it could occur during non-business hours or whether the parking and users of this access could be accommodated at an alternative location.

Depending on the subsurface construction design option, construction of the Midway Landfill Alternative could require ingress and egress by a substantially greater number of large trucks, over a much longer duration, than for the Preferred or South 344th Street alternatives. To avoid potential traffic impacts on SR 99 from the number of additional trucks, short acceleration and deceleration lanes could be added to the construction entrance to the landfill site to allow outbound trucks to get up to speed and allow inbound trucks to slow down outside of the general-purpose lanes.

5.1.2.2 Acquisitions, Displacements, and Relocations

During the environmental review process, Sound Transit developed preliminary estimates for acquisitions and relocations using conceptual designs for the OMF South build alternatives. As the project continues to progress, these estimates will continue to be refined. This section focuses on residential displacements. Business displacements are detailed in Section 5.1.2.3, Economics, and displacement of social resources is discussed in Section 5.1.2.5, Social Resources, Community Facilities, and Neighborhoods.

The South 344th Street Alternative would have the most residential and business displacements, and the Midway Landfill Alternative would have the least. For both the Preferred and South 344th Street alternatives, most residential displacements would occur within Belmor from the addition of the mainline tracks. Belmor is a manufactured/mobile home community for people aged 55 and older and is comprised of one large parcel (approximately 63 acres) with capacity for over 300 mobile homes and several resident amenities, including a golf course, club house, and pool. Each resident rents the land on which the mobile homes sit, and some of the mobile homes are owned by residents, while others are rented.

Belmor makes up almost one quarter of the area of Census Block Group 303131; more than half of the remaining area is devoted to commercial land uses. Additionally, the population within Belmor likely represents more than half of the total population of the block group. That means that the demographics within the census block group are likely a good representation for the demographics within Belmor. The population in this particular block group is 46 percent minority and 23 percent low income, which are both lower than the average minority and low-income populations in the study areas for the Preferred and South 344th Street alternatives and Federal Way as a whole (Table E.3-1) and similar to the Sound Transit service district average of 42 percent minority and 21 percent low income.

The census data are largely confirmed by information gathered by Sound Transit during targeted outreach with Belmor residents (discussed in Section 4.5 above). Through this outreach, Sound Transit learned that many Belmor residents are retired and living on fixed incomes — though they are not necessarily considered low-income — and that the population is largely English speaking.

In addition to displacements in Belmor from the mainline tracks, the Preferred and South 344th Street alternatives would displace between 15 and 20 additional residences, respectively, associated with the OMF site. For the Preferred Alternative, displaced residences north of S 336th Street include five single-family homes and one four-unit multi-family building. These residences are in a relatively small census block group (303132) that is 87 percent minority and 56 percent low-income, which are above the averages for the Sound Transit service district, the Preferred Alternative study area, and Federal Way (Table E.3-1).

Both the Preferred and South 344th Street alternatives would displace residents along S 340th Street. Displaced residences along S 340th Street are all single-family homes and are in a much larger census block group (303133), so it is more difficult to accurately assign representative demographics. The population in this block group is 73 percent minority and 48 percent low income, both of which are above the averages for the Sound Transit service district, the Preferred, and South 344th Street study areas, and Federal Way (Table E.3-1).

The South 344th Street Alternative includes displacement of residents along 18th Place S in the same census block group (303133) as described above. As noted, these displacements occur in census block groups with a higher percentage of low-income and minority populations than the Sound Transit service district average and Federal Way.

After the Sound Transit Board selects the project to be built and the real estate process moves forward, a detailed residential occupancy survey will be completed for all potentially affected property owners and tenants. The purpose of this survey is to determine specific needs of those being relocated, and it includes questions about income, ethnicity, family size, and replacement preferences.

Avoidance, Minimization, and Mitigation

When developing the OMF South alternatives, Sound Transit used several measures to avoid and minimize potential acquisition impacts. The prospective OMF South sites were analyzed for potential property impacts, and the build alternatives evaluated in this Final EIS were ultimately identified, in part, to avoid or minimize impacts to residents and businesses. During design, the OMF South sites were configured to meet programming requirements while minimizing, to the extent feasible, acquisitions, displacements, and relocations. The mainline tracks have been located near or within public rights-of-way to reduce the number of private property impacts.

For all residential relocations, a qualified relocation agent is assigned to work with each resident through the process of relocation and transition to replacement housing. The goal of the relocation agents is to facilitate a smooth transition to replacement housing. A relocation agent would contact each resident personally to explain relocation assistance, eligibility, and entitlements. For all relocations, a Sound Transit relocation agent would interview the affected individuals to:

- Determine any special needs and requirements.
- Explain the relocation process, entitlements, and payments.
- Offer relocation advisory assistance.
- Offer transportation, if necessary.
- Offer language translation services, as necessary.
- Ensure the availability of at least one comparable property in advance of displacement.
- Provide referral to comparable properties.
- Provide the amount of the maximum replacement housing entitlement and the basis for the determination in writing 90 days or more before the required vacate date.
- Inspect replacement properties to ensure they meet the Uniform Relocation Act's standards for decency, safety, and sanitary acceptability.
- Supply information on other federal, state, and local programs that offer assistance to displaced persons.
- Minimize hardship to persons adjusting to relocation by providing reimbursement for counseling services and advice on other sources of assistance that may be available.
- Recommend obtaining and provide reimbursement for a professional home inspection when purchasing a replacement dwelling.

Sound Transit's property acquisition and relocation handbooks for residential and nonresidential properties detail the agency's compensation and acquisition procedures (Sound Transit 2014a, 2014b). Sound Transit would pay normal expenses of sale, including escrow fees, title insurance, prepayment penalties, mortgage release fees, recording fees, and typical costs incurred as part of conveying title. In addition to compensating owners for property rights, other forms of compensation could include moving expenses, replacement housing payments, nonresidential reestablishment, and other eligible expenses. The relocation agent would also explain and provide the displaced person with information about the process for filing an appeal, should they disagree with any entitlement or decision made regarding their relocation.

Residents who own their home may be eligible for a purchase price differential in addition to the acquisition price paid for their property if the available comparable housing is more than the value of their current property. Additionally, they may be eligible to receive a mortgage interest differential payment if the interest rate on their new mortgage exceeds their present mortgage rate.

Residents who rent their home are eligible for a rent supplement if the rent plus utilities of the selected comparable is higher than their current rent plus utilities. A rent supplement is designed to enable a resident to rent a comparable replacement dwelling for a 3.5-year period (42 months). The resident could elect to receive the full value of the rent supplement at once in order to use it as a down payment to purchase a home and to pay certain incidental expenses to purchase a replacement dwelling. This creates a potential opportunity for someone who is currently renting their home to purchase a home if they are interested.

Additional considerations are given for residents who rent their home and are determined to be low-income based on the Uniform Relocation Act income limits (generally, low income for Uniform Act purposes is income that does not exceed 80 percent of the median family income for the applicable area, as determined by the U.S. Department of Housing and Urban Development). The basis for the calculated entitlement for those residents who rent their homes and are determined to be low income is their rent plus utilities, or 30 percent of their income, whichever is less. This would result in the same or better rental assistance payment as someone who is not determined to be low income. In most cases, 30 percent of their income is less than the current rent plus utilities. This can result in a larger rental assistance payment.

A person would not be required to move unless at least one comparable replacement dwelling is made available. Although property uses may change before construction of OMF South, research indicates that there would be available locations for displaced residents to be relocated within the same general area.

There are several different types of relocation options potentially available for displaced Belmor residents:

- Relocate within Belmor.
- Relocate to another 55-plus park, renting or purchasing a mobile home within that park, or moving their current mobile home to that park.
- Relocate to a family park, renting or purchasing a mobile home within that park, or moving their existing mobile home to that park.
- Rent or purchase a vacant lot and relocate their existing mobile home to the site.
- Relocate to a purchased or rented single-family residence, condominium, or apartment.

Other options could include senior living, retirement community housing, or assisted living facilities.

Relocation of mobile home residents could be challenging because there is little availability in mobile home communities within Pierce or King counties. However, the owners of Belmor own and lease 24 single-wide mobile home units within the project area and have indicated they plan to relocate those impacted units to other areas within Belmor and continue to rent to the tenants who wish to remain.

5.1.2.3 Economics

For all build alternatives, long-term economic impacts are mainly associated with business displacements and employment changes. Religious facilities (e.g., churches) were included in total business displacements for the purpose of analysis in the EIS but impacts to these facilities are detailed in Section 5.1.2.5, Social Resources, Community Facilities, and Neighborhoods.

The South 344th Street Alternative would displace the most businesses and employees, all of which are associated with the OMF site. The Preferred Alternative would displace roughly half as many businesses, and the Midway Landfill Alternative would displace even fewer. As shown in Tables E.5-2 through E.5-4, displacements for all alternatives are within block groups with a higher percentage of low-income and minority populations than the Sound Transit service district. For the Preferred and South 344th Street alternatives, a majority of the business displacements in Federal Way are related to automotive or equipment industries that serve an area that is greater than the study area. Additionally, the Preferred Alternative would displace an in-home childcare center (see Section 5.1.2.5, Social Resources, Community Facilities, and

Neighborhoods below), and the South 344th Street Alternative would displace two specialized facilities — Ellenos Yogurt and GarageTown. The Midway Landfill Alternative would displace an insurance firm, a vison care center, and a paint sales and recycling center.

The effects of potential business displacements are complex. Substantial displacement of local businesses can affect residents and businesses alike. Often the direct impacts for displaced businesses are financial, but there can be other consequences as well. Firm size and community importance may determine the level of impact on employment and to the community. For example, small and minority-owned businesses that rely on a localized customer base may have more difficulty finding substitute locations. Businesses that use machinery or hazardous substances may require large parcels or have additional challenges that may make relocation difficult. Further, a business may have a suitable place to relocate, but the new location could limit access to its existing labor pool.

Similar to residential relocations, a detailed business survey will be completed after the Sound Transit Board selects the project to be built and the real estate process moves forward. The purpose of a business survey is to collect general information that can help determine if businesses are owned, employed, or frequented by environmental justice populations. With the exception of the in-home childcare center (see Section 5.1.2.5, Social Resources, Community Facilities, and Neighborhoods), based on outreach and community input to date, businesses displaced by the project alternatives are not key resources, employers, or gathering places for environmental justice populations. There are similar retail businesses in the area that would be accessible to the community.

Avoidance, Minimization, and Mitigation

For business relocations, adequate commercial and industrial spaces may be available in the market to relocate building owners and tenants displaced as part of the project. Industrial users requiring specific lot sizes and utilities may be more difficult to relocate, including properties such as GarageTown and Ellenos Yogurt that have specific needs, like storage facilities or specialized machinery.

Businesses and nonprofit organizations displaced by the project would be offered relocation assistance, advisory services, and monetary benefits. Qualified relocation agents are assigned to work with displaced business throughout the process of locating a replacement property and making the transition to the new location. The goal of the relocation agent is to assist the displaced business or nonprofit organization in locating a replacement site and successfully completing their move.

A relocation agent would personally visit each displaced business to explain the following:

- Explain relocation services and payments available, eligibility requirements, and procedures for obtaining assistance.
- Determine the relocation needs and preference for the operation by completing an occupancy survey form.
- Offer language translation services, as necessary.
- Provide advice on other sources of assistance and technical help.
- Explain substitute personal property and actual direct loss of tangible personal property so that the business owner can make informed decisions regarding the relocation.

The level of advisory services may be different for each displaced business depending on the complexity of the business operation. Sound Transit would provide information on the availability, purchase price, and rental costs of suitable commercial properties and locations and/or refer the displaced business to real property specialists in the area. The relocation agent would assist a business to become established in a replacement location. Businesses are eligible to receive relocation benefits including moving expenses, reestablishment expenses, or a fixed moving payment. Reestablishment expenses of up to a maximum of $50,000 may include, but are not limited to:

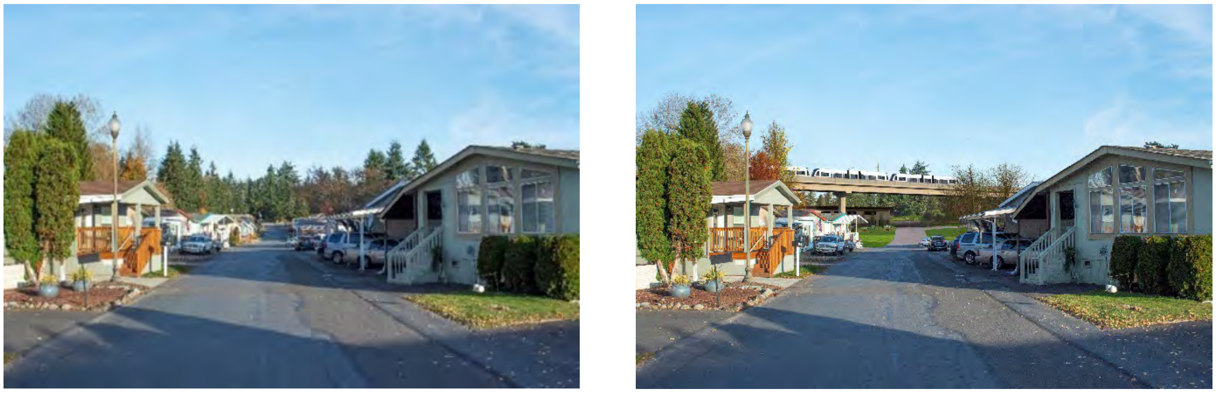
- Repairs or improvements to the replacement real property as required by federal, state, local law, codes, or ordinances.
- Modifications to the replacement property to accommodate the business operation or make replacement structure suitable for conducting the business.
- Construction and installation costs, for exterior signing to advertise the business.
- Redecoration or replacement of soiled or worn surfaces (e.g., carpeting, paneling, or painting).
- Advertising of replacement location.
- Estimated increased costs for 2 years at the replacement site for such items as lease or rental charges, personal or real property taxes, insurance premiums, and utility charges (excluding impact fees).

Additionally, if they prefer, businesses may be eligible for a fixed payment in lieu of moving, site search, and reestablishment expenses. The fixed payment is based on the average net earnings of the business for 2 taxable years immediately preceding the taxable year in which it would be displaced. The fixed payment entitlement is a minimum of $1,000 and a maximum of $40,000.

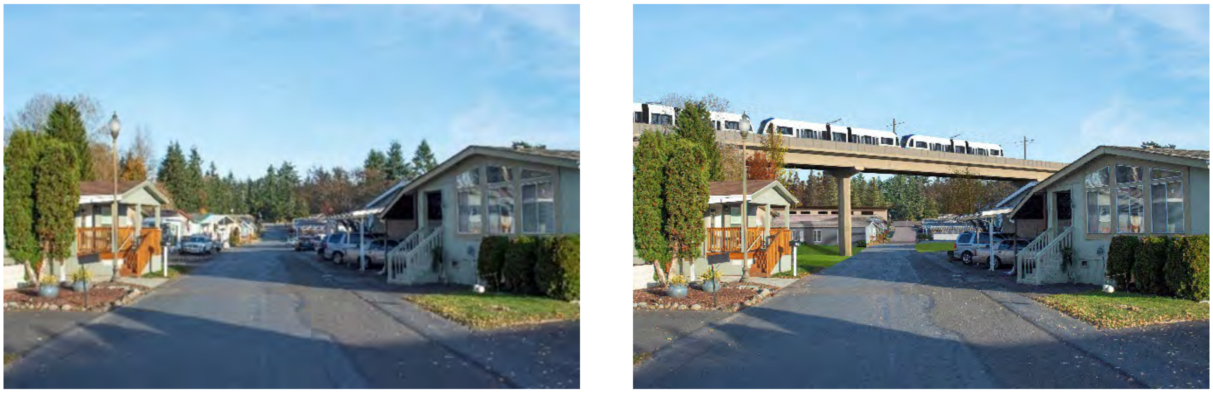
5.1.2.4 Visual and Aesthetics Resources

The Preferred and South 344th Street alternatives would cause visual impacts along the mainline track to adjacent residences. Visual impacts would occur from the removal of trees and vegetation and introduction of the large-scale light rail mainline track. As shown in Tables E.5-2 through E.5-4, visual impacts would occur in two block groups, one with similar percentages of low-income and minority populations to the Sound Transit service district and one with higher percentages. Figures E.5-1 and E.5-2 show visual simulations from these areas.

The Midway Landfill Alternative would have low to moderate visual impacts to residences north and south of the site from prominent buildings, retaining walls, and the lead track. As shown in Table E.5-4, visual impacts would occur in a block group with higher concentrations of minority and low-income populations than the Sound Transit service district.

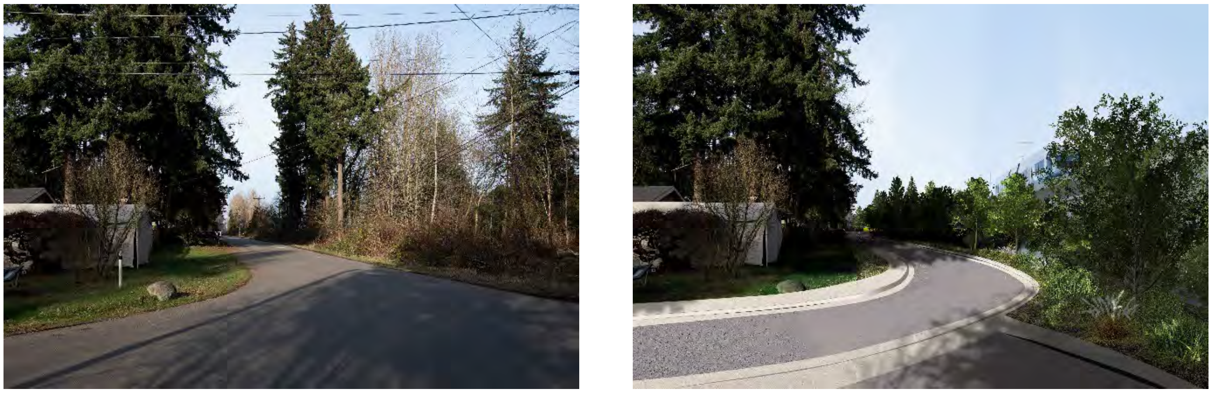


Existing Condition *Simulation of Mainline with 40 mph Alignment*



Existing Condition *Simulation of Mainline with 55 mph Design Option*

Figure E.5-1 Mainline Tracks Looking East from Belmor



Existing Condition *Simulation of Proposed Conditions approximately 10 years after planting*

Figure E.5-2 Mainline Tracks Looking North from 24th Ave S

Avoidance, Minimization, and Mitigation

As described in Final EIS Section 3.7, Visual and Aesthetic Resources, when developing the OMF South build alternatives, Sound Transit worked to minimize the height of structures to avoid and minimize potential visual impacts. As the design advances, Sound Transit would consider site context, adhere to landscape guidelines in the Sound Transit Design Criteria Manual, and include context-sensitive design measures with input from affected communities and jurisdictions.

In addition to the avoidance and minimization measures, Sound Transit would implement mitigation measures in areas near residences to reduce sensitive impacts. These measures would include the following:

1. In areas adjacent to residences, where there is adequate space, add on-site landscaping adjacent to residential areas to help screen views of project components while ensuring safety and security.

2. In areas adjacent to residences, where not enough room exists for landscaping to screen views of retaining or noise walls, Sound Transit would treat the walls with visually interesting elements, such as design treatments that incorporate textures, patterns, color, or climbing vines.

While these mitigation measures would help soften the view of project elements, visual impacts from the Preferred and South 344th Street alternatives would not be fully mitigated at Belmor or along 24th Avenue S due to the large-scale nature of the mainline track and limited opportunities for screening.

5.1.2.5 Social Resources, Community Facilities, and Neighborhoods

Impacts to social resources are primarily related to displacement of religious facilities, which could affect community cohesion in neighborhoods surrounding the OMF South build alternatives. Section 5.1.2.3, Economics, provides additional information about Sound Transit's property acquisition and relocation policies and procedures that would be applied to all displaced social resources and community facilities.

The Preferred Alternative would displace one religious facility, the Christian Faith Center church, which includes an associated day care center (CF Kidz) and separate religiously affiliated school (Pacific Christian Academy). The Christian Faith Center is a large-capacity church; therefore, it could be challenging to relocate a religious facility of this size and displacing it would impact the members of the service population from within and beyond the 0.5-mile study area. Based on outreach with the Christian Faith Center, they serve minority and low-income populations and serve a broad geographic area. In addition to CF Kidz at the Christian Faith Center, the Preferred Alternative would displace an in-home childcare center for children ages 2 to 13. This childcare center offers programs in English and Somali and accepts subsidized payments.

Both the 40 mph Alignment and the 55 mph Design Option would permanently impact the private Belmor golf course. The 40 mph Alignment would modify the northeast corner of the course by relocating one golf hole and shortening its associated fairway. The golf course path in that area would also be altered but would serve the same function. The 55 mph Design Option would permanently affect a second hole and its associated fairway and further alter the cart path. However, its function would be maintained.

The South 344th Street Alternative would displace four religious facilities: Family Life Community Church, Voice of Hope Church, and Redwood Church of God and Tabernacle Temple of Praise, which share a building. Based on project engagement and other research, these churches offer services in multiple languages and serve minority populations. For example, the Family Life Community Church offers services in English and Spanish, and the Voice of Hope Church offers services in Russian. The displacement of religious facilities could affect community cohesion if relocation of these facilities is not able to be accommodated in proximity to the study area; however, because these churches are currently located in commercial or industrial buildings, it is likely that they could be relocated to comparable properties nearby.

During construction, the Preferred and South 344th Street alternatives could also temporarily impact surrounding social resources and religious facilities, such as El Centro de la Raza, the Iglesia Ni Cristo Church, the KAC Baptist Church, and the Russian-Ukrainian Seventh Day Adventist Church. Each of these religious facilities provide church services in languages other than English and their congregations are likely largely made up of minority populations. The mainline design options would also affect the private golf course as described above for the Preferred Alternative.

There would be no long-term or construction impacts to social resources or community facilities within the Midway Landfill Alternative study area. The Midway Landfill Alternative would have the fewest impacts to social resources and community cohesion compared to other build alternatives.

Avoidance, Minimization, and Mitigation

Relocations of social resources, like religious facilities and childcare centers, would be treated similarly to business relocations described in Section 5.1.2.3, Economics. With the exception of the Christian Faith Center, displaced religious facilities may be less complex to relocate due to their smaller size and location in commercial buildings. The Christian Faith Center and Pacific Christian Academy may be challenging to relocate because of their large size.

As discussed in the impact section above, the Preferred Alternative would displace two childcare centers — one at the Christian Faith Center and one in-home facility. At the time of writing, there is one other childcare facility within the 0.5-mile study area. Within an expanded 1-mile buffer, there are five additional childcare facilities, all of which accept subsidized payments. Based on outreach to these facilities, there is available capacity for new children to attend at this time.

As part of the OMF South project, specific design features, BMPs, and mitigation measures would eliminate or minimize impacts to social resources, community facilities, and neighborhoods. These measures are summarized below.

- There would be avoidance and minimization measures to address potential traffic congestion during construction, such as developing a traffic management plan and avoiding traffic disruptions during peak travel times.
- Sound Transit's policies and procedures comply with federal, state, and local property acquisition and relocation policies and, in some cases, provide advisory services to property owners above the minimum requirements of federal and state law.
- In areas adjacent to residents, where there is adequate space, add on-site landscaping adjacent to residential areas to help screen views of project components while ensuring safety and security. In areas adjacent to residences where not enough room exists for

landscaping to screen views of retaining or noise walls, Sound Transit would treat the walls with visually interesting elements, such as design treatments that incorporate textures, patterns, color, or trellises with climbing vines.

- For the Preferred and South 344th Street alternatives, noise barriers are proposed for mitigation along the 55 mph Design Option elevated mainline tracks.

5.2 Indirect Impacts

OMF South is anticipated to result in minimal adverse indirect impacts. As described in more detail in Section 5.4, Project Benefits, OMF South would support system-wide Link light rail expansion for the approved Sound Transit 3 program. With the system-wide expansion, it may be reasonably expected to increase the potential for future private commercial and/or residential development activity near Link stations, which could increase property values near stations and augment tax revenues. However, this activity may also affect the availability of low-income housing opportunities and may result in the loss of affordable housing and/or displacement of low-income people. Housing goals and policies of local jurisdictions will influence future affordable housing options near Link stations. Sound Transit's Equitable Transit Oriented Development Policy encourages affordable housing development on any potential surplus property near future Link stations, which could help mitigate cumulative impacts (Sound Transit 2018).

5.3 Cumulative Impacts

To help inform the cumulative impact analysis, Sound Transit used EPA's EJScreen tool. EJScreen is a mapping tool that combines environmental and demographic socioeconomic indicators. It assesses the following 13 environmental indicators: particulate matter 2.5, ozone, diesel particulate matter, air toxics cancer risk, air toxics respiratory hazard index, toxic release to air, traffic proximity, lead paint, risk management plan facility proximity, hazardous waste proximity, superfund proximity, underground storage tanks, and wastewater discharge. It also includes supplemental indexes to offer a perspective on the community-level vulnerability based on income, employment, limited English speaking, education, and life expectancy.

The EJScreen tool identified that the OMF South study area is in the 80th and 90th percentiles for many of the indexes when compared to national and state data. This indicates that the study area has been historically overburdened and there is a high potential for future projects to have cumulative impacts. Note that the census block results presented by EJScreen are actually census tract values distributed homogeneously across all census blocks within a census tract. As described in Section 3.2 above, this environmental justice analysis uses demographic data at the block group level to provide a more accurate portrayal of environmental justice populations within the project study area, given the localized nature of the project's potential impacts.

Sound Transit analyzed potential direct and cumulative impacts of the OMF South project related to the EJ indicators. These impacts included air quality, traffic, hazardous materials, and wastewater. They are discussed in the Final EIS in Chapter 3, Affected Environment, Environmental Impacts, and Mitigation Measures, and in Chapter 4, Cumulative Effects Analysis. Based on this analysis, with implementation of best management practices, OMF South would not contribute cumulative impacts to the EJScreen environmental indicators

The OMF South project, in addition to the TDLE and FWLE projects and other investments in regional transportation infrastructure, would enable more frequent Link service and improve overall mobility within the region, in addition to improving local connections to economic opportunity, goods, and services. Improved transit service and mobility and access to opportunity would be considered a benefit to low-income and minority populations in the study area and the region as a whole.

If OMF South were constructed at similar times as other large infrastructure projects, residents and businesses could experience increased short-term construction impacts due to cumulative increases in congestion, noise, and access limitations. This would include impacts to communities that have greater a percentage of low-income and minority populations than the Sound Transit service district. However, after mitigation and implementation of avoidance and minimization measures, adverse impacts would be reduced.

As part of the City Center Access project in Federal Way, transportation improvements and stream culvert work would displace Belmor residents in the vicinity of the OMF South mainline tracks for the Preferred and South 344th Street alternatives. Some of these mobile home displacements may overlap with OMF South displacements, or there may be additional displacements. Because the City Center Access project does not have construction funding, it is likely that OMF South would begin the acquisition and relocation process before Federal Way begins project construction. Therefore, the two projects are unlikely to have overlapping construction impacts, but may have cumulative impacts within Belmor, depending on the OMF South mainline track option and the final design for the City Center Access project.

5.4 Project Benefits

Under DOT Order 5610.2C, the benefits of a proposed transportation project may be considered when determining whether any disproportionate and adverse effects on minority and low-income populations would occur. The OMF South project would have indirect and direct benefits.

5.4.1 Indirect Benefits

OMF South would support the system-wide expansion of light rail as called for in Sound Transit 3, including expansion of the Link light rail system north to Everett; south to Tacoma; east to downtown Redmond, south Kirkland, and Issaquah; and west to Ballard and West Seattle, totaling 116 miles with over 80 stations. It would support reliability of the Sound Transit 3 system expansion by providing capacity to meet projected ridership demands. This would, in turn, improve regional connectivity and mobility and provide a reliable means of transportation for populations reliant on public transit, including low-income and minority populations. This would include improved access to jobs, social services, and medical care. Conversely, if OMF South were not built, maintenance of the LRV fleet would be reduced, which could lead to less system reliability and a poor rider experience, which may discourage ridership.

While all populations within the Sound Transit service area would realize these benefits to the same extent, they could accrue to a higher degree for minority and low-income residents as a primary and affordable means of transportation. As described in Section 5.1.1, 2018–2019 survey data identified that approximately 43 percent of Sound Transit ridership across all modes (Link light rail, Regional Express bus, and Sounder) are minority, many of whom use transit for more than commuting purposes, and approximately 22 percent of minority riders and 13 percent of non-minority riders made less than $33,000 annually. Additionally, data from the American Public Transportation Association (2008) indicate that in 2007, approximately 60 percent of all transit passengers in the United States were minorities. Data from a 2006 report (Center for Housing Policy 2006) illustrated that families with annual household incomes between $20,000 and $50,000 have transportation costs as high as or higher than housing.

5.4.2 Direct Benefits

5.4.2.1 Economic and Employment Benefits

Benefits to all populations, including environmental justice populations, would accrue through the addition of new jobs to build and operate the project. Sound Transit would require project labor agreements that include:

- Commitment to labor stability and a local workforce
- Apprenticeship and employment goals for people of color and women
- Non-discrimination and fairness in employment
- Requirement that 21 percent of all hours be set aside for persons of color (actual Sound Transit practices have resulted in 32 percent of all hours being held by persons of color)

Additionally, Sound Transit would implement its Disadvantage Business Enterprise (DBE) program that:

- Requires that 18.2 percent of all construction and architecture/engineering consultant dollars be set aside for DBE contracts (i.e., contracts with small businesses that are at least 51 percent owned by individuals who are socially and economically disadvantaged).
- Strives to eliminate barriers, create opportunities, and build capacity for underrepresented and women-owned businesses.

Additionally, as described in Final EIS Section 3.5, Economics, the increased purchase and sale of goods and services within the community to facilitate construction and the positive economic effects of construction workers' purchases in food and retail within the community would benefit businesses that are owned by environmental justice populations in the surrounding area.

The OMF South project would also generate about 610 living-wage jobs to operate the facility. The facility would include classroom space so that it is forward-compatible with future apprentice programs.

5.4.2.2 Community Cohesion

The design of the OMF South Preferred Alternative includes elements to support community cohesion within the surrounding neighborhood, which includes a higher percentage of low-income and minority populations than the Sound Transit service district. The Preferred Alternative would include a public space on the northern side of the site along South 336th Street to activate the area. Improvements would be coordinated with Federal Way and the community to help determine the most beneficial and desired uses and could include a multi-use pathway and other amenities, such as seating, landscaping, artwork, and educational signage.

Additionally, the Preferred Alternative would include a multi-use path, separated from the road by a curb and planting strip, along the extension of 18th Place S to allow for two-way travel by people walking, rolling, and biking. This would provide enhanced north-south access adjacent to the site to the communities in the study area to replace the current in-road designated greenway along 20th Avenue S.[2]

---

[2] A greenway is a bicycle facility that consists of shared-lane markings and guide signs along mostly residential or other low-speed or low-volume roads.

6 CONCLUSION

FTA and Sound Transit conducted this environmental justice analysis to identify, analyze and address potential disproportionate and adverse human health and environmental effects of the OMF South project on environmental justice communities. FTA will make the final environmental justice determination for the project following selection by the Sound Transit Board of a project site to be built. As described in Section 2, Methods and Approach, FTA's determination considers who may be affected; whether the net results will be disproportionately high after consideration of the totality of the circumstances, including project impacts, mitigation, and benefits; and whether adverse impacts would be predominantly borne by environmental justice populations. The determination also includes whether there would be a denial of, reduction in, or significant delay in the receipt of benefits by minority or low-income populations. To determine whether adverse impacts would be predominantly borne by environmental justice populations, FTA considers:

- Whether the adverse effects on environmental justice populations exceed those borne by non-environmental justice populations.
- Whether cumulative or indirect effects would adversely affect an environmental justice population.
- Whether mitigation and enhancement measures will be taken for environmental justice and non-environmental justice populations.
- Whether there are off-setting benefits to environmental justice populations as compared to non-environmental justice populations.

This environmental impact analysis for environmental justice populations concludes:

- Sound Transit conducted a robust, meaningful community engagement program that included a demographic analysis to identify low-income and minority populations. The study area includes block groups with concentrations of minority and low-income populations that are higher than the Sound Transit service district average.
- All alternatives would have limited cumulative and indirect impacts, as described in sections 5.2, Indirect Impacts, and 5.3, Cumulative Impacts.
- All build alternatives would result in potential direct impacts, as described in Table E.5-1. Direct impacts would be in areas with both similar and higher percentages of low-income and minority populations than the Sound Transit service district:
    - For the Preferred and South 344th Street alternatives, the majority of residential displacements occur in a block group that has low-income and minority populations similar to the Sound Transit service district. The Midway Landfill Alternative avoids residential displacements.
    - For all alternatives, business displacements occur in block groups that have higher percentages of low-income and minority populations than the Sound Transit service district. The same is true for displacement of social resources associated with the Preferred and South 344th Street alternatives.
    - For the Preferred and South 344th Street alternatives, high visual impacts occur in block groups that have both similar and higher percentages of low-income and minority populations than the Sound Transit service district. The Midway Landfill Alternative has moderate visual impacts in a block group with higher percentage of low-income and minority populations.

- Sound Transit would mitigate impacts for all populations through the application of measures presented in Chapter 3 of the Final EIS and summarized above in Table E.5-1 and Section 5, Project Impacts, Benefits, and Mitigation. Mitigation and enhancement measures would be applied equally between environmental justice and non-environmental justice populations. The design measures, best management practices, and other mitigation measures would address and reduce the project impacts; however, the visual impacts from the Preferred and South 344th Street alternatives would not be fully mitigated because of the scale of the mainline track.
- The project is anticipated to have direct and indirect benefits. Direct benefits include (1) enhanced community connectivity for the Preferred Alternative through public space and a multi-use trail integrated into the site design that would benefit the community the project is within, (2) construction jobs with project labor agreements and a DBE program to support hiring of minority populations, and (3) creation of new jobs to operate the facility that could benefit both environmental justice and non-environmental justice populations. Indirect benefits include supporting the Sound Transit 3 system expansion by providing capacity to ensure transit reliability, access, connectivity, frequency, and improved rider experience. There would be no denial of, reduction in, or significant delay in the receipt of benefits by minority or low-income populations.
- After consideration of the totality of the circumstances, including mitigation, offsetting direct and indirect benefits, and impacts, the net results of the project would not have disproportionate and adverse effects on minority and low-income populations as described under EO 12898, EO 14096, and DOT Order 5610.2C.

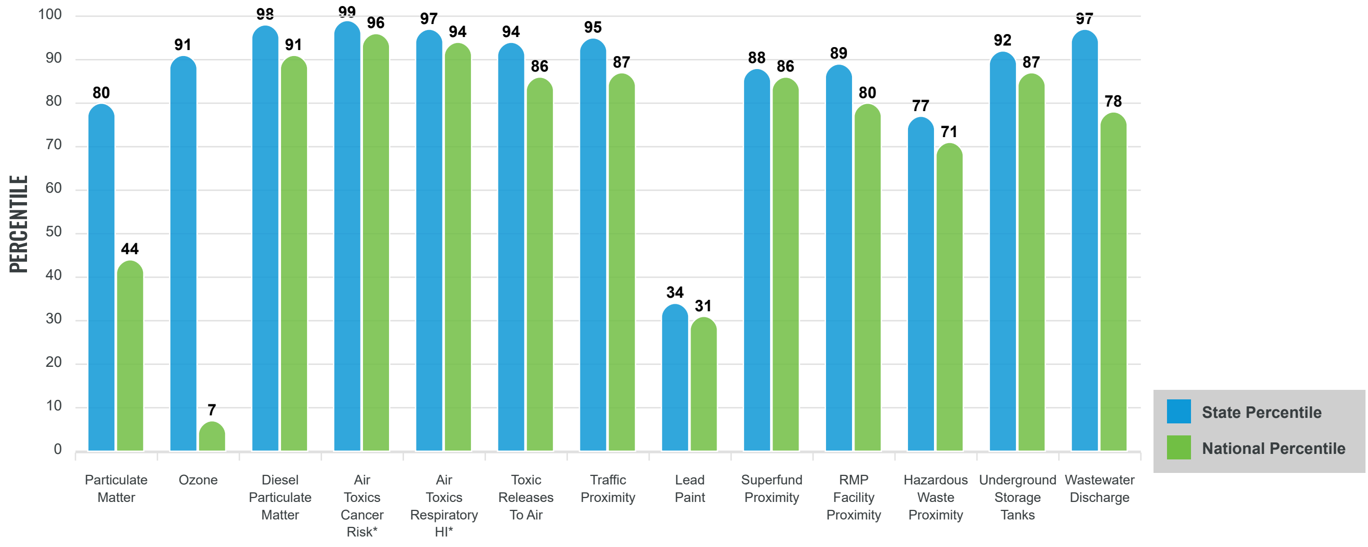
Environmental Justice & Supplemental Indexes

The environmental justice and supplemental indexes are a combination of environmental and socioeconomic information. There are thirteen EJ indexes and supplemental indexes in EJScreen reflecting the 13 environmental indicators. The indexes for a selected area are compared to those for all other locations in the state or nation. For more information and calculation details on the EJ and supplemental indexes, please visit the EJScreen website.

EJ INDEXES

The EJ indexes help users screen for potential EJ concerns. To do this, the EJ index combines data on low income and people of color populations with a single environmental indicator.

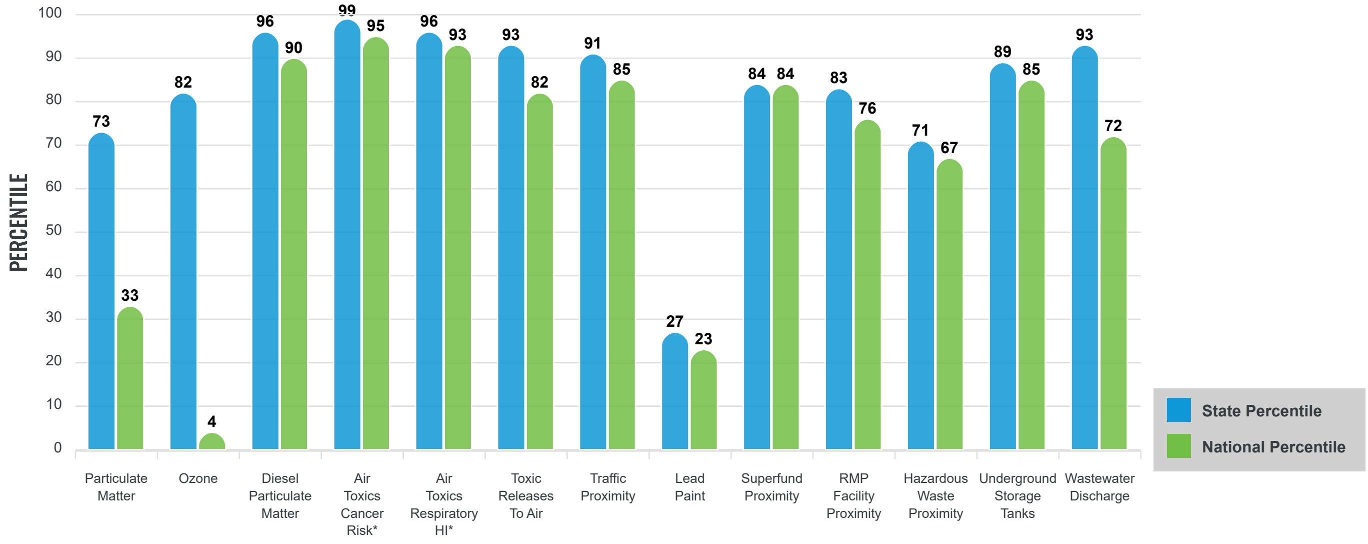
EJ INDEXES FOR THE SELECTED LOCATION



SUPPLEMENTAL INDEXES

The supplemental indexes offer a different perspective on community-level vulnerability. They combine data on percent low-income, percent linguistically isolated, percent less than high school education, percent unemployed, and low life expectancy with a single environmental indicator.

SUPPLEMENTAL INDEXES FOR THE SELECTED LOCATION



These percentiles provide perspective on how the selected block group or buffer area compares to the entire state or nation.

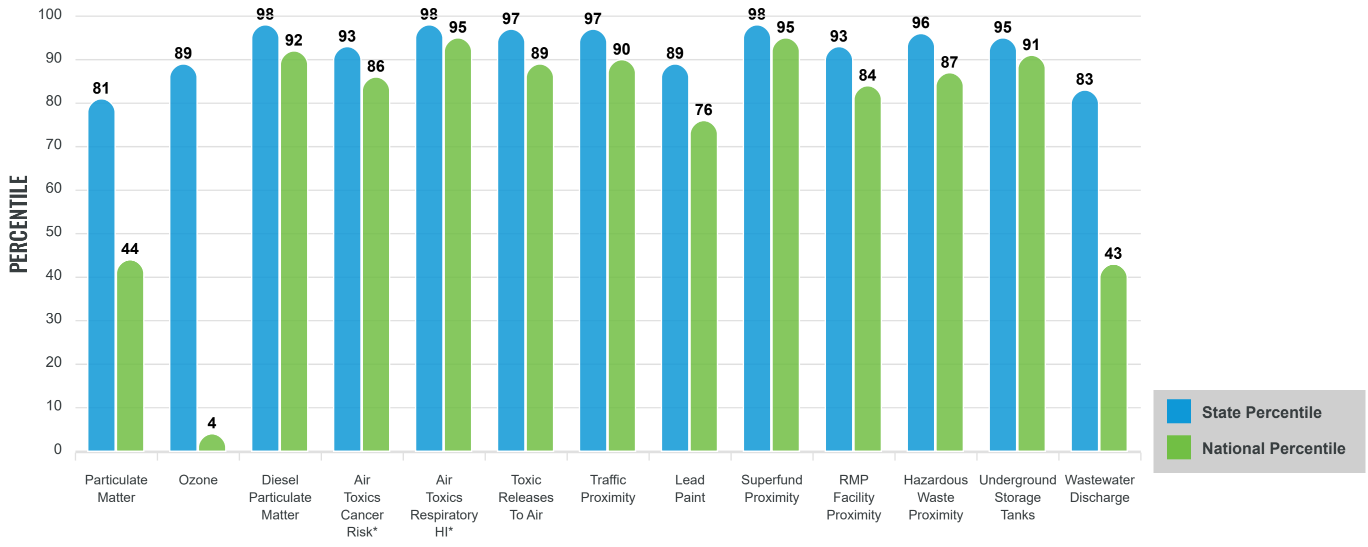
Environmental Justice & Supplemental Indexes

The environmental justice and supplemental indexes are a combination of environmental and socioeconomic information. There are thirteen EJ indexes and supplemental indexes in EJScreen reflecting the 13 environmental indicators. The indexes for a selected area are compared to those for all other locations in the state or nation. For more information and calculation details on the EJ and supplemental indexes, please visit the EJScreen website.

EJ INDEXES

The EJ indexes help users screen for potential EJ concerns. To do this, the EJ index combines data on low income and people of color populations with a single environmental indicator.

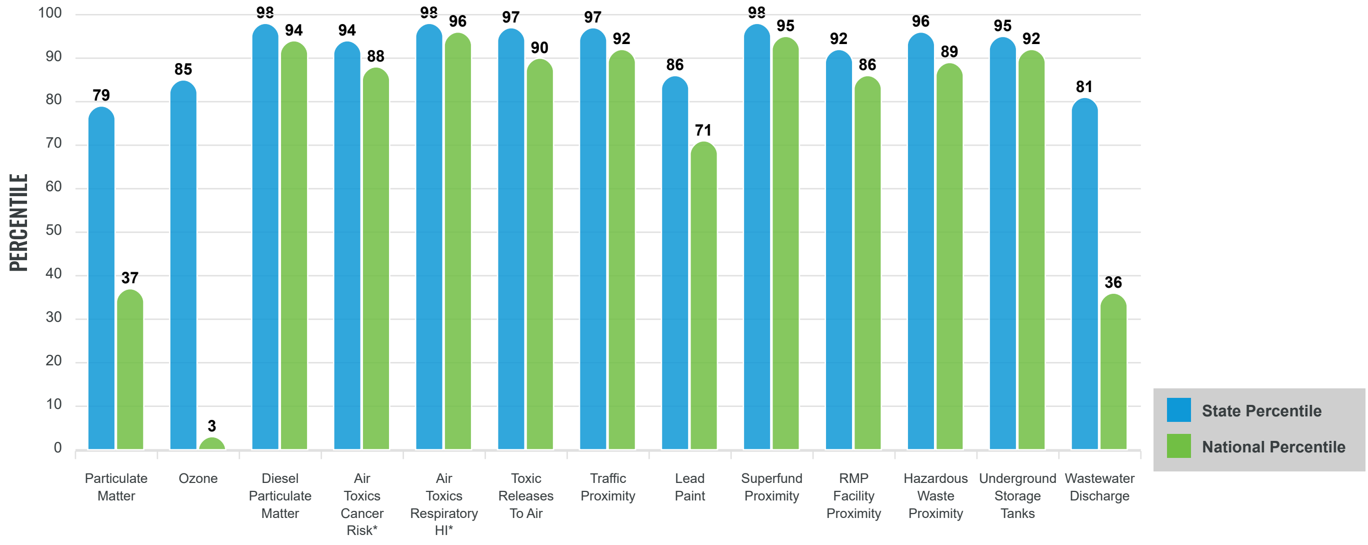
EJ INDEXES FOR THE SELECTED LOCATION



SUPPLEMENTAL INDEXES

The supplemental indexes offer a different perspective on community-level vulnerability. They combine data on percent low-income, percent linguistically isolated, percent less than high school education, percent unemployed, and low life expectancy with a single environmental indicator.

SUPPLEMENTAL INDEXES FOR THE SELECTED LOCATION



These percentiles provide perspective on how the selected block group or buffer area compares to the entire state or nation.

1 INTRODUCTION AND REGULATORY FRAMEWORK

The regulations at Title 23 of the Code of Federal Regulations (CFR), part 774 implement Title 23 of the U.S. Code (U.S.C.) section 138 and Title 49 of the U.S. Code section 303, which were originally enacted as Section 4(f) of the Department of Transportation Act of 1966 and are still commonly referred to as Section 4(f). Under these laws, the Federal Transit Administration (FTA) and the Federal Highway Administration (FHWA) are generally prohibited from approving projects that would use land from:

> *…a significant publicly-owned park, recreation area or wildlife and waterfowl refuge or any significant historic site, unless there is no feasible and prudent alternative to the use of land from the property and the action includes all possible planning to minimize harm to the property resulting from the use.*

A use is generally defined as a transportation activity that permanently or temporarily acquires land from a Section 4(f) property or that substantially impairs the important activities, features, or attributes that qualify the property as a Section 4(f) resource.

Section 4(f) applies to publicly owned parks and recreation areas that are open to the public; publicly owned wildlife and waterfowl refuges; and historic sites of national, state, or local significance. The Department of Transportation regulations for Section 4(f) define historic properties sites as those properties listed in or eligible for the National Register of Historic Places (NRHP).

This evaluation identifies potential Section 4(f) resources that may be used by the Operations and Maintenance Facility (OMF) South and any associated impacts to those resources. Other disciplines considered in this analysis include Transportation, Acquisitions, Displacements, and Relocations; Land Use; Visual and Aesthetic Resources; Noise and Vibration; Historic and Archaeological Resources; and Parks and Recreational Resources. A discussion of the affected environment, adverse impacts, and potential mitigation measures for each of these is found in Chapter 3 of the OMF South Final Environmental Impact Statement (EIS).

This appendix also considers any impacts under Section 6(f) of the 1965 Land and Water Conservation Fund Act of 1965 (54 U.S.C. section 2003), which prohibits the conversion of properties developed with funding from the Land and Water Conservation Fund to a nonrecreational purpose without approval of the U.S. Department of the Interior's National Park Service. Similar to Section 6(f), documentation and consultation are also required to approve any changes to or conversion of properties directly funded by the Washington State Recreation and Conservation Office (RCO; Title 79A Revised Code of Washington).

1.1 Study Area

The study area for this analysis is the same as the Parks and Recreational Resources analysis used in the Final EIS (Section 3.17), which encompasses the area of potential effect (APE) used for the Historic and Archaeological Resources analysis (Section 3.16).

The Parks and Recreational Resources study area includes existing parks, trails, recreation sites, dedicated open space areas, and adjacent public rights-of-way used for access to these facilities within 0.25 mile of each OMF South site. The study area is of a sufficient size to capture potential impacts from the construction and operation of the OMF South build alternatives (for example, visual effects or noise impacts) that could affect uses of 4(f) resources.

No 6(f) resources or designated wildlife and waterfowl refuges of national, state, or local significance have been identified in the study area. As a result, these resources are not discussed further.

The APE extends from the project elements (mainline, OMF sites, and construction staging areas) to the nearest tax parcel, or a maximum of 200 feet where large tax parcels are adjacent to project elements.

1.2 Section 4(f) "Uses"

Under Section 4(f), a use can be permanent, temporary, or constructive. **Permanent use** would acquire or incorporate all or part of a Section 4(f) property as part of the transportation facility.

Temporary use occurs when the project temporarily occupies any portion of the resource (typically during construction) and substantially impairs the resources. If all the conditions listed below are met, a temporary occupancy of land is not considered to constitute a use under Section 4(f):

- The project would occupy the property less than the time needed for the construction of the project and there will be no change in ownership;
- There are minimal changes to the Section 4(f) resource;
- There are no permanent adverse physical changes or interference with protected activities, features, or attributes of the resource;
- The land is restored to the same or better condition; and
- The federal, state, or local officials with jurisdiction over the resource and the authority over the land agree in writing that the use is not adverse.

Constructive use can occur when the project is near a Section 4(f) resource and has effects that substantially impair the protected activities, features, or attributes of the property. For example, a park property that is primarily a scenic viewpoint could have a constructive use if a transportation project blocks its views.

1.3 Approval of Projects That Use Section 4(f) Property

Although the use of Section 4(f) property is generally prohibited, a transportation use of a Section 4(f) property can be approved if:

- The use of the property meets the requirements for a regulatory exception established under Section 4(f). For instance, a temporary use can be allowed if it meets the temporary occupancy requirements described above,

Or:

- The use will have a *de minimis* impact on the property

Or:

- There is no feasible and prudent avoidance alternative to using the property

And:

- The program or project includes all possible planning to minimize harm to the property resulting from the use.

De minimis impacts are those that do not “adversely affect the activities, features, and attributes” of a Section 4(f) resource. A *de minimis* impact finding can consider any mitigation or enhancement measures that would be implemented, including design measures to avoid or reduce impacts. Before FTA can make this finding, it must send a written notice to the official with jurisdiction over the resource and there must be an opportunity for public notice and comment.

For public parks or recreation properties, a *de minimis* impact finding requires written concurrence from the official with jurisdiction over the property, such as a city or county parks department. There must also be an opportunity for public notice and comment.

For historic and archaeological sites eligible under National Register of Historic Places criteria A, B, or C, a *de minimis* impact finding is allowed if FTA has made a “no adverse effect” [1] finding in compliance with Section 106 of the National Historic Preservation Act of 1966 (see Section 3.16 of the Final EIS, Historic and Archaeological Resources.). Before making a *de minimis* finding, FTA must send a written notice to the State Historic Preservation Office. If the State Historic Preservation Office concurs or does not object, FTA may proceed with its finding. When FTA has made a *de minimis* determination, the project is not required to analyze avoidance alternatives for that Section 4(f) property.

1.4 Avoidance Alternatives and Least Harm Analysis

If a project’s Section 4(f) use is greater than *de minimis*, FTA is required to consider whether there are feasible and prudent alternatives that would avoid the use. Section 4(f) defines a feasible alternative as an alternative that could be built as a matter of sound engineering judgment. An alternative is prudent if:

- It meets the project purpose and need;
- It would not compromise the project to a degree that makes it unreasonable to proceed in light of its stated purpose and need;
- It would not cause extraordinary operational or safety problems;
- It would not cause any other unique problems or severe economic or environmental impacts;
- It would not cause extraordinary community disruption;
- The construction costs would not be of an extraordinary magnitude; and
- There are no other factors that collectively have adverse impacts that present unique problems or reach extraordinary magnitudes.

If the FTA finds that an alternative causes a Section 4(f) use and there is another alternative that is feasible and prudent, then the alternative that causes a Section 4(f) use must be removed from consideration. But if there are no prudent and feasible alternatives that can avoid all Section 4(f) resources, then FTA must choose the alternative that will have the least overall harm in light of the statute’s preservation purpose. This is called the Least Harm Analysis.

---

[1] An adverse effect to an archaeological site eligible for the National Register of Historic Places only under criterion D is not considered a use under Section 4(f) evaluation.

2 PROPOSED ACTION

The Central Puget Sound Regional Transit Authority (Sound Transit) proposes to construct and operate OMF South to meet agency needs for an expanded fleet of light rail vehicles (LRVs) identified in Sound Transit 3: The Regional Transit System Plan for Central Puget Sound (Sound Transit 3). The OMF South project would be used to store, maintain, and deploy approximately 144 LRVs for daily service. It would provide facilities for vehicle storage, inspections, maintenance and repair, interior vehicle cleaning, and exterior vehicle washing. Additionally, the facility would receive, test, and commission new LRVs for the entire system.

OMF South would also be used to accommodate administrative and operational functions, such as serving as a report base for LRV operators. Included is a Maintenance of Way building for maintenance and storage of spare parts for tracks, vehicle propulsion equipment, train signals, and other infrastructure, in addition to storage facilities for the entire Link system. Other facility elements would include employee and visitor parking, operations staff offices, maintenance staff offices, dispatcher work stations, an employee report room, and areas with lockers, showers, and restrooms for both operators and maintenance personnel.

OMF South would need to have tracks connecting to a light rail line that will be operating when the facility is planned to open, which is the Federal Way Link Extension. The length and location of these connecting tracks varies by alternative.

Three site alternatives for the proposed project are evaluated in the Final EIS: two in Federal Way and one in Kent. These alternatives are named the Preferred Alternative, South 344th Street Alternative, and Midway Landfill Alternative, respectively.

3 SECTION 4(F) RESOURCES

This Section 4(f) assessment identified and considered potential impacts to publicly owned parks and recreation areas within 0.25 mile of each OMF South build alternative. NRHP-eligible historic properties in the area of impact were also evaluated.

Sound Transit's Section 4(f) evaluation is also informed by the research and coordination for Section 106 of the National Historic Preservation Act of 1966 (NHPA), as described in Section 3.16 of the Final EIS, and the Parks and Recreational Resources analysis (Section 3.17), which identify important features, qualities, and characteristics of potential Section 4(f) resources.

Parks and recreational resources within the study area that potentially qualify as Section 4(f) resources are shown on Figures F.3-1 and F.3-2 and listed in Tables F.4-1 and F.4-2 below. With the exception of the Bonneville Power Association's (BPA's) Tacoma-Covington No. 2, 3, and 4 and Tacoma-Raver No. 1 transmission lines, no previously identified historic period built environmental resources have been listed or found eligible for listing in the Washington Heritage Register and NRHP.

3.1 Public Parks and Recreation Areas

3.1.1 Preferred and South 344th Street Alternatives

Sound Transit identified two parks within the Parks and Recreational Resources study area for the Preferred and the South 344th Street alternatives that qualify as Section 4(f) properties: Cedar Grove Park and Town Square Park. The Pacific Rim Bonsai Museum and Rhododendron Species Foundation and Botanical Garden, located within the study area of the Preferred and the South 344th Street alternatives, would not qualify as a Section 4(f) property because it is owned by a nonprofit organization. In any case, there would be no impacts from the project on this property.

3.1.1.1 Cedar Grove Park, Federal Way

Cedar Grove Park is a 2.7-acre neighborhood park managed by the Federal Way Parks Department. It includes a playground, picnic facilities, grassy open space, paved trails, and a half-court basketball court. It is primarily surrounded by single-family residential homes, buffered by large trees and vegetation, and is accessible via S 333rd Street and various paths through the adjacent neighborhood.

3.1.1.2 Town Square Park, Federal Way

Town Square Park is a 4.1-acre community park constructed in 2014 in the Federal Way City Center and managed by the Federal Way Parks Department. This property is bounded by S 316th Street to the north, 20th Avenue S to the west, 21st Avenue S to the east, and a private parcel to the south. Federal Way improved the park in 2016 to make some features more permanent and add other features requested by the public. The park includes a track zip ride, children's play area, basketball court, parking, picnic area, restrooms, and a seasonal splash park. Federal Way considers Town Square Park to be a recreational resource of local significance, and therefore the park is being considered a Section 4(f) property.

3.1.2 Midway Alternative

In the Parks and Recreational Resources study area for the Midway Landfill Alternative, Sound Transit identified four developed parks and one public open space that qualify as Section 4(f) properties.

3.1.2.1 Parkside Park, Des Moines

Parkside Park is a 4.4-acre neighborhood park managed by Des Moines Parks and Recreation. The park features a paved trail system that is accessible per the American with Disabilities Act, providing access to all portions of the park. It also has a multiuse paved sport court, fitness equipment, picnic tables, and benches. Mature trees frame the central open lawn and active recreation areas. The park is located at 2518 S 244th Street in Des Moines.

3.1.2.2 Parkside Wetlands, Des Moines

Parkside Wetlands is a 14-acre natural area managed by Des Moines Parks and Recreation. The park includes trails that are interspersed within a dense mix of deciduous and coniferous forest and wetlands. This park is adjacent to Parkside Park on 26th Avenue S in Des Moines.

3.1.2.3 Salt Air Vista Park, Kent

This 2-acre neighborhood park is bordered by the Parkside wetlands on the west and is managed by Kent Parks. It features play equipment, a picnic area, open space, and trails. The park is located at 24615 26th Place S in Kent. It is two blocks west of SR-99. The park was recently renovated and reopened in May 2023.

3.1.2.4 Linda Heights Park, Kent

Linda Heights Park is a 4.2-acre park managed by Kent Parks. It features a half-court basketball, picnic table, play equipment, and public art. The park is adjacent to and east of I-5 and is buffered from the freeway by a wide stand of mature mixed forest. It is an RCO-funded park.

3.1.2.5 West Hill Park, Kent

West Hills Park is a 13-acre site owned by the city of Kent. It is undeveloped with no facilities. The park is adjacent to the Kent Armory and is composed of a grassy field and dense vegetation near the headwaters of Midway Creek.

All existing and designated parks and recreational properties that were reviewed for potential Section 4(f) eligibility are listed in Tables F.4-1 and F.4-2 in Section 4.1 below and shown on Figures F.3-1 and F.3-2.

3.2 Wildlife and Waterfowl Refuges

No designated wildlife and waterfowl refuges of national, state, or local significance exist in the study area.

3.3 Historic Sites

Evaluation of historic sites under Section 4(f) relates directly to evaluation of resources and impacts through the NHPA Section 106 process, the method by which a cultural resource's significance is determined for a federal undertaking. The results of the Section 106 analysis are a critical part of determining the applicability and outcome of the Section 4(f) use determination. Historic sites protected under Section 4(f) include “any prehistoric or historic district, site, building, structure, or object included in, or eligible for inclusion in, the National Register of Historic Places.”

Section 3.16 of the Final EIS, Historic and Archaeological Resources, provides information on historic properties in the OMF South build alternatives APE. A total of 86 historic-period, built-environment resources were surveyed in the APE, of which 58 resources were old enough to meet minimum age criteria for NRHP eligibility consideration. Based on the survey results, FTA determined that there are two resources (Tacoma-Covington Nos. 2, 3, and 4 and Tacoma-Raver No. 1 transmission lines) that are eligible for listing in the NRHP in the APE. See Appendix G4, Historic and Archaeological Resources Technical Report, of the Final EIS for the correspondence from FTA and DAHP.

In 2020, BPA conducted its own Section 106 consultation with the State Historic Preservation Officer (SHPO) for the relocation of electrical transmission towers within the OMF South APE that would be impacted by the project. These towers included those along the Tacoma-Covington Nos. 2, 3, and 4 and Tacoma-Raver No. 1 transmission lines. BPA also determined that the transmission lines were eligible for listing in the NRHP, a finding with which SHPO concurred with in a letter dated August 19, 2021 (See Appendix G4).

4 PROJECT IMPACTS AND POTENTIAL MITIGATION

This section summarizes the potential impacts to Section 4(f) properties in the study areas for the OMF South project alternatives. Impacts include acquisition and conversion of properties to a transportation use, changes to access to a Section 4(f) property, and proximity impacts that could impair use of the property (which federal regulations refer to as a "constructive use"). Where this evaluation concludes there will be no Section 4(f) use, it means the project alternatives would not adversely affect Section 4(f) resources.

4.1 Impacts

The following analyses from the Final EIS were reviewed to determine whether project alternatives would result in a Section 4(f) use: Transportation (Section 3.2), Acquisitions, Displacements and Relocations (Section 3.3), Visual and Aesthetics (Section 3.7), Noise and Vibration (Section 3.9), Historic and Archaeological Resources (Section 3.16), and Parks and Recreational Resources (Section 3.17).

The mainline for the Preferred and South 344th Street alternatives would require the relocation of BPA powerlines. FTA and BPA determined, and SHPO concurred, that raising the transmission lines to accommodate the OMF South project would have no adverse effect on historic properties under Section 106. Due to this, FTA has determined that the Preferred and South 344th Street alternatives would have a *de minimis* impact under Section 4(f).

All other Section 4(f) resources are far enough away (300 feet or more) from the OMF South site alternatives and mainline that they would not experience any proximity-related impacts from the operation of OMF South. While LRVs travelling along the mainline could cause moderate noise impacts to some adjacent residents, those impacts would be mitigated, and would not affect 4(f) resources farther away.

The following minor, temporary effects to potential Section 4(f) resources in the study area may occur:

- Construction of the mainline tracks for the Preferred and South 344th Street alternatives could impact sensitive receptors within 250 feet of daytime pile driving activities, which may be necessary for construction of the elevated mainline. The project would require some utility locations on S 333rd Street, which borders Cedar Grove Park to the south. During construction, S 333rd Street could be affected by detour or lane closures east of the park, but the park would still be accessible from the west or north.
- For the Midway Landfill Alternative, there would be an increase in the number of construction truck trips along SR 99 and I-5, which border the site on the west and east, respectively, and are located between the site and the parks. The number of truck trips would vary depending on the subsurface design option, but it is expected that park properties would experience limited construction effects due to the existing traffic, noise, vibration, and visual effects from the normal operation of those roadways.
- It is possible some parks in the study area could be exposed to construction vehicle emissions, airborne dust, and noise impacts during construction. However, these effects are expected to be minor and temporary since the project would be held to comply with construction best management practices and permit conditions to minimize and control dust and vehicle emissions and to comply with local noise ordinances.
- Cedar Grove Park within the Preferred and South 344th Street alternative study area would be within the closest proximity to construction activities, at approximately 300 feet from

mainline construction, just beyond the range of noise impacts from pile driving activities, which may be necessary for construction of the elevated mainline. While construction noise and activities would be perceptible from the park, the impacts would be temporary and transitory in nature, and would not prevent use of the playground, basketball court, or other amenities that make the park an eligible 4(f) resource. The other parks, as mentioned above, would be outside the range of impacts described in the Final EIS or separated from the site by SR-99 and I-5, which would provide effective buffers from construction activities.

Based on review of these analyses in the Final EIS, none of the alternatives would require any land from any of the park properties for either construction or operation of OMF South, and no construction activities or operational activities of the project would rise to the level of a permanent, temporary, or constructive use under Section 4(f).

Because no wildlife or waterfowl refuges are in the study area, no such resources would be impacted.

Tables F.4-1 and F.4-2 list the park properties within the study area of the build alternatives, including the preliminary Section 4(f) determination.

Table F.4-1 Public Parks and Recreational Properties Reviewed for Section 4(f) Eligibility: Preferred and South 344th Street Alternatives

Park/Resource and Ownership	Size (acres)	Type or Function	Facilities	Potential Section 4(f) Resource	Section 4(f) Determination
Cedar Grove Park, City of Federal Way	2.6	Developed park	Trail walking, nature viewing, picnic area, play area	Yes	No use
Town Square Park, City of Federal Way	3.9	Developed park	Play areas, basketball, picnic area, splash park	Yes	No use
Pacific Rim Bonsai Museum and Rhododendron Botanical (privately owned)	22	Developed park	Walking, scenic viewing	No	Privately owned; Section 4(f) does not apply

Table F.4-2 Public Parks and Recreational Properties Reviewed for Section 4(f) Eligibility: Midway Landfill Alternative

Park/Resource and Ownership	Size (acres)	Type or Function	Facilities	Potential Section 4(f) Resource	Section 4(f) Determination
Parkside Park, City of Des Moines	4.4	Developed park	Trail walking, multiuse sport court, fitness equipment, picnic tables and benches	Yes	No use
Parkside Wetlands, City of Des Moines	14	Developed park	Trail walking, nature viewing	Yes	No use
Salt Air Vista Park, City of Kent	2	Developed park	Trail walking, play equipment, picnic area, open space	Yes	No use
Linda Heights Park, City of Kent	4.2	Developed park	1/2 court basketball, picnic table, play equipment, open space	Yes	No use
West Hill Park, City of Kent	13	Undeveloped	Grassy field, no facilities	Yes	No use

4.2 Mitigation

As no impacts to Section 4(f) properties have been identified, no mitigation measures are anticipated.

5 RECORD OF COORDINATION

In letters to SHPO and BPA dated October 27, 2023, FTA determined that there would be no adverse effect to the BPA power lines, and disclosed that FTA was considering a *de minimis* impact finding under Section 4(f). SHPO concurred with FTA’s no adverse effect determination and acknowledged FTA’s Section 4(f) *de minimis* impact determination in a letter dated October 31, 2023. These correspondences are in Appendix G4, Historic and Archaeological Resources Technical Report, of the Final EIS. No other Section 4(f) properties would be affected. Due to this, no other formal consultation between FTA, Sound Transit, and agencies with jurisdiction over the Section 4(f) properties in the study area has occurred.

6 CONCLUSION

Section 4(f): Based on the analysis in the Final EIS, there would be a *de minimis* impact to the BPA powerlines with the Preferred and South 344th Street alternatives. None of the alternatives would require any land from any other Section 4(f) properties for either construction or operation of OMF South, and no other impacts would rise to the level of a Section 4(f) use. Because none of the alternatives would have more than a *de minimis* use on Section 4(f) properties, no mitigation for these individual properties is proposed.

Section 6(f): No 6(f) resources or designated wildlife and waterfowl refuges of national, state, or local significance have been identified in the study area. As a result, no mitigation for these resources is proposed.

APPENDIX H1: POTENTIALLY AFFECTED PARCELS

The Operations and Maintenance Facility (OMF) South project would require property acquisitions, displacements, and relocations of existing uses. This appendix lists potentially affected parcels associated with each build alternative based on current conceptual designs and the existing conditions at the time the analysis was conducted. The properties listed and mapped in this appendix are intended to be used for comparison across alternatives and should not be interpreted as the final determination regarding property acquisitions because the list will be updated as the project design is refined. Accordingly, the number and type of displacements could vary between what is disclosed in this Draft Environmental Impact Statement and what is ultimately required.

For the purposes of this analysis, potentially affected parcels are presented as a combined number that considers two types of property acquisitions — partial and full acquisitions — described below:

- **Partial acquisitions**, which would acquire part of a parcel but not displace the current use. In some instances, businesses or residential units on a parcel would be displaced. Partial acquisitions also include permanent guideway and maintenance easements.
- **Full acquisitions**, which would acquire the full parcel and displace the current use. Full acquisitions include parcels that might not be fully needed for the project but would be affected to the extent that existing uses would be substantially impaired, such as by loss of parking or access. This includes parcels that would be acquired for construction activities, although in some cases all or part of the parcel would be available for other use or for redevelopment after construction is complete.

In addition to the potential property acquisitions, the project would also require temporary construction easements (TCEs) and use of public right-of-way, which are not listed in this appendix. TCEs would be needed for roadway improvements, culvert replacements, staging areas, construction access, and other temporary construction activities. When construction is complete, these properties would be restored to their previous conditions or better. The temporary construction activities would not substantially disrupt or permanently displace existing uses.

Property impacts were determined using King County Assessor's information and aerial imagery. Table H1-1 presents the potentially affected parcels for each of the OMF South build alternatives. The parcels listed in Table H1-1 are also shown in Figures H1-1 through H1-4, according to the alternative. Parcels are identified in the figures using Map ID numbers which were created uniquely for this project. These Map ID numbers correlate with the King County parcel ID numbers listed in Table H1-1, along with other parcel information including address and generalized land use.

APPENDIX H2: LAND USE TECHNICAL APPENDIX

1.1 Methods

Environmental impacts associated with land use were assessed by examining data collected from local jurisdictions and local and regional land use plans and policies. Local plans, policies, and zoning were reviewed to determine the proposed project's consistency with local regulations. Geographic information system (GIS) data, aerial photographs, and verification techniques were used to assess land use compatibility. Because comprehensive plan land use and zoning code designations vary in definition depending on the jurisdiction (i.e., the cities of Kent, Federal Way, and Des Moines, as well as King County), land uses were generalized into dominant land use categories to compare them consistently. The generalized land use categories include single-family residential, multi-family residential, commercial/industrial, public/institutional, and vacant. These categories were also used to classify the existing land use for potentially affected parcels for each of the build alternatives.

1.1.1 Data Sources

- City of Federal Way Comprehensive Plan maps and GIS data (land use designations, zones, subarea plan boundaries) (City of Federal Way 2023a)
- City of Kent Comprehensive Plan maps and GIS data (land use designations, zones, subarea plan boundaries) (City of Kent 2011, 2019b, 2022)
- City of Des Moines Comprehensive Plan maps and GIS data (land use designations, zones, subarea plan boundaries) (City of Des Moines 2020)
- King County Department of Assessments parcel GIS data and present land uses (King County 2019)
- Puget Sound Regional Council (PSRC) Demographics and Land Use Vision data and GIS data (PSRC 2017, 2019)

1.2 Resources and Regulatory Requirements

Development of the proposed Operations and Maintenance Facility (OMF) South project would result in direct land use conversions within the footprint of the OMF site for each of the build alternatives. The OMF project could also indirectly influence land use conversions or change land use patterns in surrounding areas. The policies, plans, and documents governing land use in the study area for the proposed project are listed below:

1.2.1 State and Regional

- Washington State Growth Management Act (GMA), originally adopted in 1990, and primarily codified under the Revised Code of Washington (RCW) Chapter 36.70A (Growth Management – Planning by Selected Counties and Cities) and Essential Public Facility under RCW 36.70A.200
- PSRC Vision 2050, adopted 2020 (PSRC 2020)
- PSRC, The Growing Transit Communities Strategy – A Transit Corridor Action Agenda for the Central Puget Sound Region (2013)
- PSRC, Regional Transportation Plan, adopted in May 2018. This plan is an update of Transportation 2040, which was adopted in 2010

- Sound Transit Regional Transit Long-Range Plan, adopted in December 2014 (Sound Transit 2014)
- Sound Transit Equitable Transit Oriented Development (TOD) Policy (Board Resolution No. R2018-10) addresses how the agency should consider potential for TOD development near transit facilities being planned and studied and reflects the requirements of Sound Transit 3 and the RCW 81.112.350, the agency’s enabling legislation (Sound Transit 2018)
- Sound Transit Real Property Excess, Surplus and Disposition Policy (Board Resolution No. R2013-30) (Sound Transit 2013)

1.2.2 Local

- The city of Des Moines Municipal Code is current through Ordinance 1784, passed November 2023
- The city of Kent Midway Subarea Plan was adopted in December 2011
- Kent City Code was most recently amended in December 2023. Title 15 Zoning within the KCC was most recently amended in August 2023 (adopted in May 1983), and Chapter 15.15, High Capacity Transit Facilities, is under Title 15 zoning
- The Federal Way Revised Code – Zoning is current through Ordinance 22-942 which was passed in December 2023 (annual updates are expected)
- The King County Zoning Code was last updated in November 2023 and is expected to have annual updates (originally the code was adopted through Ordinance 11621, Section 1 (part) and Ordinance 10870, Section 2, 1993)
- The 2015 Comprehensive Plan for the city of Federal Way, last amended in 2023
- The 2015 Comprehensive Plan for the city of Kent, last amended in 2022
- The 2015 Comprehensive Plan for the city of Des Moines, referred to as Des Moines 2035, last amended in 2020
- The King County 2016 Comprehensive Plan, last amended in 2022
- City of Kent Change of Use or Occupancy Classification (2016)
- The city of Federal Way Shoreline Master Program, last updated in 2019
- The city of Kent Shoreline Master Program, last updated in 2019
- Highline College Master Plan (adopted 2016)

1.3 Affected Environment

Each OMF South build alternative will be developed within the context of the Washington State GMA. The GMA is a series of state statutes originally adopted in 1990, and the GMA Chapter, Growth Management - Planning by Selected Counties and Cities (codified under RCW Chapter 36.70A) describes the development context. Essentially, the GMA requires higher-growth local governments (cities and counties) to develop comprehensive plans to manage growth through several measures and a series of goals. These measures include the identification and protection of critical areas and natural resource land, designation of urban growth areas, and preparation and implementation of comprehensive plans through capital investments and development goals. The proposed project is within the urban growth boundaries of the cities of Kent and Federal Way.

The GMA also ensures that zoning is consistent with comprehensive plans, and it prohibits local governments from precluding the siting of essential public facilities either through comprehensive plans or zoning (RCW 36.70A.200, section 5). As a “regional transit authority facility,” the proposed project is considered an essential public facility by the GMA (RCW 36.70A.200). Therefore, local jurisdictions would be required to avoid preclusion of the project and would need to accommodate it in their comprehensive plans, land use goals and policies, and development regulations once Sound Transit selects the alternative to be built.

1.3.1 Preferred and South 344th Street Alternatives

The Preferred and South 344th Street alternatives are located in the city of Federal Way. While these alternatives are not located in a subarea plan, they are still covered under the Federal Way Comprehensive Plan.

The Land Use chapter of the comprehensive plan includes policies supporting transit under various comprehensive plan land use designations. These land use designations provide the purposes and goals for different zoning districts (City of Federal Way 2023a). The multi-family land use designation encourages street patterns and amenities that increase transit use. In addition, commercial land uses promote commercial development along street edges. Community business land uses encourage the transformation of the Pacific Highway community business corridors into mixed-use areas including commercial and office and high-quality mid-rise developments (three to seven stories). These areas will be designed to integrate auto, pedestrian, and transit circulation to support traffic flow and safety and ensure quality site and building design and functional and aesthetic compatibility between uses.

The Preferred and South 344th Street alternatives are primarily within the Multi-Family Residential (RM) land use designation, in addition to smaller areas within Commercial Enterprise (CE), City Center Core (CC-C), and Commercial Business (CB) designations (City of Federal Way 2023a). The Federal Way Comprehensive Plan also promotes “creating a city center as an area of concentrated employment and housing served by high capacity transit, public facilities, parks, and open space” (City of Federal Way 2023a). Federal Way has a Regional Growth/Urban Center identified as the “City Center,” which is situated in the same area as the CC-C mixed-use zone.

Federal Way has been designated as a Regional Growth Center by the PSRC (2020), generally due to its potential for urban growth in the region. The mainline tracks extending from the Federal Way Transit Center to the Preferred and South 344th Street alternatives would be located in this CC-C zone. In addition, Federal Way was designated a Countywide Growth Center Candidate by the King County Growth Management Planning Council, making Federal Way eligible to receive PSRC transportation grants (City of Federal Way 2024). The Countywide

Growth Center designation requires Federal Way to prepare a subarea plan that will be adopted as part of its 2024 update to its comprehensive plan. The South Station Subarea Plan is a small geographic long-range plan that is envisioned to serve as a policy guide for future development around the future Federal Way Downtown station (City of Federal Way 2024).

1.3.2 Midway Landfill Alternative

The Midway Landfill Alternative is within the city of Kent's Midway Subarea as identified in their comprehensive plan. This subarea is located in the western portion of Kent along a north-south ridgeline situated between the Duwamish/Green River Valley and the Puget Sound. The subarea shares a boundary with the cities of Des Moines, SeaTac, and Federal Way, as well as unincorporated King County. The Midway Subarea is bound to the north by State Route (SR) 516 and to the south by S 272nd Street. It is less than 5 miles south of the Seattle-Tacoma International Airport, with direct access to Interstate 5 via SR 516 and is approximately 2 miles from the Kent North Valley Industrial Area.

The Midway Subarea Plan was inspired by the prospect of a high-capacity light rail transit system. The overall goal of the plan is to "create a dense, pedestrian-friendly, sustainable community […] around nodes of high-capacity mass transit while maintaining auto-oriented uses between the transit-oriented nodes" (City of Kent 2011). The intent for the area is to transition it from low-density residential and commercial uses to higher-density development within transit station nodes, including a mixture of services, office, and residential uses. The Midway Subarea Plan identifies policies to ensure new development in the Midway Subarea will have transit-supported features; the city is expected to work with Sound Transit during all phases of light rail extension planning to ensure Kent's preferred rail alignment and station location are realized. The plan also outlines policies for pedestrian-friendly development design features by establishing a multimodal circulation network within areas designated Transit Oriented Community. Specific goals within the plan are as follows:

1) Provide a mix of land uses in the hopes of increasing revenues, job opportunities, and housing choices.
2) Reconcile development standards along the border between Kent and Des Moines for consistency.
3) Provide for public transportation in the development of land use policies, development regulations, and implementation strategies.
4) Provide appropriate land uses and regulations that support bus rapid transit within the Pacific Highway corridor.
5) Identify preferred alignments for the light rail and accompanying station and stop locations within Kent and Des Moines.
6) Ensure design that provides a safe and inviting pedestrian environment.

The Federal Way Link Extension (FWLE) light rail alignment and future Kent/Des Moines Station (between S 236th Street and S 234th Street) are located within the Midway Subarea Plan, and the proposed OMF South project would be located within the Pacific Highway South commercial transportation corridor portion of the Midway Subarea Plan. The Pacific Highway South commercial area of the Midway Subarea plan is intended for auto-oriented commercial and light industrial uses. The proposed use (maintenance facility buildings) would be similar in scale and development intensity as light industrial uses and would be consistent with the urban character intended for this area.

1.4 Land Use Tables

The following tables (Table H2-1 through Table H2-10) concern OMF South’s consistency with the primary dimensional standards of zoning codes, land use regulations, and comprehensive plan policies for Kent and Federal Way that would pertain to the project. Tables H2-1 and H2-2 address the Preferred, South 344th Street, and Midway Landfill alternatives’ consistency with the description and intent of the zoning types located within their project footprints. Table H2-3 lists the permitted and conditional uses within the various land use types under each zoning category for the Preferred and South 344th Street alternatives in the city of Federal Way. Table H2-4 lists the permitted and non-permitted uses within the various land use types under each zoning category for the Midway Landfill Alternative in the city of Kent. Tables H2-5 through H2-7 discuss the consistency of the OMF South project with each alternative’s city comprehensive and subarea plans. Lastly, Tables H2-8 and H2-9 list the acreage of each zone within the project alternative study areas, and Table H2-10 displays the acreage of zoning type that would be acquired by each alternative.

1.4.1 Study Area Zoning

Table H2-1 Preferred and South 344th Street Alternatives Zones Description and Consistency

City of Federal Way Zone	Purpose, Select Development Standards	Consistency with Applicable Policies
CC-C: City Center Core	The purpose and intent of establishing a City Center Core is to create a higher density, mixed use designation where office, retail, government uses, and residential uses are concentrated. Other uses such as culture/civic facilities and community services are highly encouraged. Select Development Standards: Height limitation is 75 feet for a light rail or commuter rail transit facility. There is no minimum lot size for light rail or commuter transit facilities, except for 20 feet along single-family residential zones.	Both alternatives would convert approximately 17 acres of CC-C zoned property adjacent to I-5 to construct the mainline tracks. The CC-C zone is in a Regional Growth Center (PSRC 2020) where future land uses encourage concentrated mixed-use development. The addition of the mainline tracks could restrict future development immediately adjacent to the proposed site, but, overall, the small, elongated footprint of the mainline tracks would not preclude development of the CC-C zone as envisioned. This zone lists light rail or commuter rail transit facilities as a permitted land use, which could encompass the use of transportation operation and maintenance facilities. The mainline tracks could possibly provide additional light rail access to this center through the addition of the proposed Tacoma Dome Link Extension light rail service. Light rail facilities would require a Process IV review.
RM-2400 and RM-3600: Multi-Family	The purpose and intent of the multi-family residential land use designation is to provide a range of housing types to accommodate anticipated residential growth. Select Development Standards: The light rail or commuter rail transit facility use is not recognized in the RM zone. The Washington State Growth Management Act prohibits local governments from precluding the siting of essential public facilities through zoning. OMF South is a “regional transit authority facility” and is, therefore, explicitly recognized as an essential public facility in the Growth Management Act (RCW 36.70A.200).	The mainline tracks and a portion of the maintenance and operations facility would occupy approximately 72 acres of multi-family zoning for the Preferred Alternative and approximately 43 acres of multi-family zoning for the South 344th Street Alternative. These multi-family zones are intended to be used to accommodate housing growth and meet a range of housing needs. There are no development standards specified for essential public facilities. However, OMF South would enter into a Development Agreement with the City of Federal Way to ensure consistency with the Comprehensive Plan.

Table H2-1 Preferred and 344th Street Alternative Zones Description and Consistency (continued)

City of Federal Way Zone	Purpose, Select Development Standards	Consistency with Applicable Policies
BC: Community Business	The purpose and intent of the Community Business designation is to support a broad mix of uses. This designation envisions mid-rise, high-quality developments containing a vibrant and compatible mix of well-integrated and designed pedestrian-oriented and auto-oriented uses. Select Development Standards: The light rail or commuter rail transit facility use is not recognized in the BC zone. The Washington State Growth Management Act prohibits local governments from precluding the siting of essential public facilities through zoning. OMF South is a “regional transit authority facility” and is, therefore, explicitly recognized as an essential public facility in the Growth Management Act (RCW 36.70A.200).	The Preferred Alternative would occupy approximately 2 acres of the BC zone adjacent to SR 99 around the guard house entrance. The broad mix of uses planned for this area could incorporate the OMF South project if the area is focused on a mix of commercial and office uses targeted for this zone. The BC zone is urban in character, with no maximum lot coverage. There are no development standards specified for essential public facilities. However, OMF South would enter into a Development Agreement with the City of Federal Way to ensure consistency with the Comprehensive Plan.
CE: Commercial Enterprise	The purpose and intent of the Commercial Enterprise zone is to capture the demand for a diverse mix of industrial, office, and retail sales and services, arrayed in well-integrated, high quality developments. Development Standards: For a light rail or commuter rail transit facility, the height limitation is 50 feet above average building elevation. There is no minimum lot size for light rail or commuter transit facilities, except for 20 feet along single-family residential zones.	The South 344th Street Alternative site and mainline tracks would occupy approximately 36 acres of the CE zone. The southeast corner yards, training track, and stormwater detention facility of the Preferred Alternative would occupy approximately 11 acres of the CE zone. The Preferred and South 344th Street alternatives would be consistent with the commercial uses because the maintenance facility buildings are similar in scale and development intensity as office buildings and warehouses. This zone lists light rail or commuter rail transit facility as a permitted land use, which could encompass the use of transportation operation and maintenance facilities. The highest proposed building is the OMF office building, estimated at 36 feet (this could change as the design progresses). The CE zone is urban in character, with no maximum lot coverage. Light rail facilities would require a Process IV review.

Source: Federal Way Municipal Code (City of Federal Way 2023b)

Note: Acreages were calculated using GIS, overlaying the project boundary on Federal Way zoning GIS data. Additional site development standards detail such as setbacks, landscaping, and parking space requirements are not provided.

Table H2-2 Midway Landfill Alternative Zones Description and Consistency

City of Kent Zone	Purpose, Select Development Standards	Consistency
MCR: Midway Commercial Residential	The purpose and intent of the MCR zoning district is to encourage the location of dense and varied retail, office, or residential activities in support of rapid light rail and mass transit options, enhance a pedestrian-oriented character, and implement the goals and policies of the Midway Subarea Plan. Select Development Standards: Height limitation is 16 stories or 200 feet, minimum lot area is 7,500 square feet, and maximum site coverage is 80 percent (site coverage is defined as including the portion of a lot covered by buildings or structures).	A portion of the lead tracks linking the OMF South to the mainline tracks are proposed for location in the MCR zone (less than 5 acres). Although transportation and utility uses are listed as conditional uses, transit OMFs are listed as prohibited, inconsistent uses. The tracks use would not be considered a mixture of retail, office, or residential uses intended for this zone; however, the proposed use would support the goal to encourage urban development in support of rapid light rail. Development of light rail tracks would be subject to a city of Kent Conditional Use Permit since transportation and utility uses are conditionally allowed. High-capacity transit facilities and their tracks are subject to Kent City Code (KCC) Chapter 15.15, a chapter which primarily outlines design regulations for high-capacity transit facilities. The proposed development would be consistent with the 80 percent maximum site coverage standard since the design would result in less than 3 percent of the site covered by buildings and structures.
CM: Commercial Manufacturing	The purpose and intent of the Commercial Manufacturing district is to provide locations for those types of developments which combine some characteristics of both retail establishments and small-scale, light industrial operations, heavy commercial and wholesale uses, and specialty manufacturing. All transit-related uses are conditional uses.	Most of the project footprint (66 acres) is proposed for location on CM zoning and would not conflict with targeted CM uses since the OMF would be similar in scale and development intensity to light industrial operations intended for the CM Zone. Transit operations and maintenance facilities are listed as a conditional use for this zone. Development of the OMF facility would be subject to a city of Kent Conditional Use Permit since transportation and

Table H2-2 Midway Landfill Alternative Zones Description and Consistency (continued)

City of Kent Zone	Purpose, Select Development Standards	Consistency
	Select Development Standards: Height limitation is two stories or 35 feet, and maximum site coverage is 50 percent (defined as including the portion of a lot covered by buildings or structures). KCC Section 15.04.195 Commercial and industrial land use development standard conditions, includes a variance provision authorizing the economic and community development director to grant one additional story in height, if during development plan review it is found that this additional story would not detract from the continuity of the area. More than one additional story may be granted by the land use and planning board.	utility uses are conditionally allowed. The highest building height, located at the OMF office building, proposed in draft plans (See Appendix C) is estimated at 36 feet (this could change as the design progresses). This proposed building height could necessitate divergence from the code standard due to the 35 feet height limitation for the CM Zone. In addition, the proposed development in total could result in approximately 11 percent of the site being covered, which is below the 50 percent maximum site coverage standard for this zone.
SR-6: Single-Family Residential	The purpose and intent of the single-family residential districts is to stabilize and preserve single-family residential neighborhoods, as designated in the comprehensive plan. It is further the purpose to provide a range of densities and minimum lot sizes in order to promote diversity and recognize a variety of residential environments. Select Development Standards: maximum site coverage is 50 percent, maximum impervious surface is 70 percent, height limitation is 2.5 stories or 35 feet.	The OMF would occupy a small portion of the SR-6 zone (0.4 acres) in the south end of the project site, along the edge of a single-family residential area and I-5. Much of the eastern part of the affected SR-6 zone area would be used to provide a track connection to the mainline tracks. This zone lists transit operations and maintenance facilities as a prohibited use. The work within this zone would consist of roadway improvements and would not include elements of the facility itself. Thus, it is not expected that the OMF Site would conflict with the SR-6 zone purpose of stabilizing and preserving single-family residential neighborhoods. Disruptions from the OMF project could be minimized through building setbacks and landscaped buffers.

Source: Kent City Code (City of Kent 2023)

Note: Acreages were calculated using GIS, overlaying the project boundary on Federal Way zoning GIS data. Additional site development standards detail such as setbacks, landscaping, and parking space requirements are not provided.

1.4.2 City of Federal Way and City of Kent Zoning and Permitted Land Use

Table H2-3 City of Federal Way Relevant Zoning and Associated Permitted and Prohibited Land Uses

City of Federal Way Zoning and Associated Permitted and Prohibited Land Uses Relevant to OMF South	
City Center Core (CC-C) Zone	
Land Use Categories	**Detailed Permitted Land Uses**
Parking Garages	• Above-grade structured parking facilities
Government Facility, Public Parks, Public Transit Shelter	• Government facility • Public parks • Public transit shelter
Public Transportation Facilities	• Light rail or commuter rail transit facility
Public Utility	• Public utility
Personal Wireless Service Facility	• Personal wireless service facility
Multi-Family (including RM 1800, RM 2400 and RM 3600)	
Land Use Categories	**Detailed Permitted Land Uses**
Public Transit Shelter	• Public transit shelter
Public Utility	• Public utility
Government Facility	• Government facility
Public Parks	• Public parks
Personal Wireless Service Facility	• Personal Wireless Service Facility (new freestanding facilities are not allowed). Note: Personal Wireless Service Facility shall be allowed only on existing towers, on publicly used structures not located in public rights-of-way, on existing structures located in the BPA Trail, and on existing structures in appropriate public rights-of-way.
Commercial Enterprise Zoning	
Land Use Categories	**Detailed Permitted Land Uses**
Manufacturing and Production, General	• Manufacturing, fabrication, or assembly of office equipment, machines, furniture, and fixtures; electrical, electronic, communications, and lighting products; appliances, bicycles, automobiles, boats, aircraft, and their component parts; heating equipment; photographic and clock instruments; toys; jewelry; musical instruments; scientific equipment; hand tools; signs; advertising displays; and similar items • Fabrication of clay, glass, ceramic, stone, china, or metal products; metal plating and coating; engraving and stone cutting • Preparation of food products; leather products; textile, fabric, or apparel • For manufacturing and production, limited, see FWRC 19.240.070 • Any manufacturing, fabrication, and assembly uses other than listed herein
Warehouse, Distribution, Storage Facilities, Truck Stops, Automotive Emissions Testing Facilities	• Warehouse and wholesale distribution facilities • Contractor’s yards for storage of commercial equipment, vehicles, bulk building materials, and similar items • Parking lots for storage of recreational vehicles and other oversized vehicles • Commercial vehicle facilities and service yards such as truck stops • Automotive emissions testing facilities

Table H2-3 City of Federal Way Relevant Zoning and Associated Permitted and Prohibited Land Uses (continued)

City of Federal Way Zoning and Associated Permitted and Prohibited Land Uses Relevant to OMF South	
Vehicle, Boat, Equipment, and Outdoor Storage Container Sales, Rental, Service, Repair, Self-Service Storage, Tow and Taxi Lots	• Sales, rental, or leasing facilities for vehicles, trucks, boats, trailers, motorcycles, equipment, outdoor storage containers, and portable moving containers • Mechanical repair, body repair, painting, or related services for vehicles, trucks, boats, trailers, motorcycles, and equipment • Vehicle service station or car wash • Self-service storage facilities • Tow and taxi lots
Public Utility	• Public utility
Government and Public	• Government facility, public parks, public transit shelter
Public Transit Facilities	• Light rail or commuter transit facility
Personal Wireless Services	• Personal Wireless Services Facilities
Community Business Zoning	
Land Use Type	• **Permitted and Conditional**
Vehicle and Equipment Sales, Service, Repair, Rental: Self-Service Storage Facilities	• Vehicle service station or car wash • Retail establishment providing vehicle, boat, or tire sales, service, repair, rental, and/or painting, passenger vehicle rental including moving trucks • Merchandise and equipment rental facilities, excluding heavy equipment rental • Tow or taxi lots • Self-service storage facilities; storage of recreational vehicles
Government Facility, Public Parks, Public Transit Shelter	• Government facility, public parks, public transit shelter
Public Utility	• Public utility
Personal Wireless Service Facility	• Personal wireless service facility

Source: City of Federal Way Title 19 Zoning and Development Code (City of Federal Way 2023b)

Notes:

(1) The city of Federal Way Zoning and Development Code does not specify Permissible, Conditional, Accessory, or Special Uses. Additionally, the zoning regulation does not distinguish between different types of multi-family zoning labels, such as RM 1800 and RM 3600.

(2) OMF South is considered an Essential Public Facility and would be reviewed under FWRC 19.105.020.

Table H2-4 Midway Landfill Alternative Zoning, City of Kent Permitted and Prohibited Uses

Commercial Manufacturing (CM) Zoning	
Transportation, Public, and Utilities Land Use	
Principally Permitted	• Wireless telecommunications facility (WTF) by administrative approval (For WTF towers 90 feet or less for a single user and up to 120 feet for two or more users. All WTFs are subject to applicable portions of KCC 15.08.035.)
Conditional	• Transportation and transit facilities, including high-capacity transit facilities • Transit operations and maintenance facilities • Utility and transportation facilities: electrical substations, pumping or regulating devices for the transmission of water, gas, steam, petroleum, etc. • Public facilities: firehouses, police stations, libraries, and administrative offices of governmental agencies, primary and secondary schools, vocational schools, and colleges • WTF by minor conditional use permit (A conditional use permit for a WTF is required if it is greater than 90 feet for a single user or 120 feet for two or more users. All WTFs are subject to applicable portions of KCC 15.08.035.)
Accessory	• Accessory uses and structures customarily appurtenant to a permitted use (Includes incidental storage facilities and loading/unloading areas.) • Electric vehicle (EV) charging station (Level 1 and 2 charging only) • Rapid charging station
Not Permitted	• Commercial parking lots or structures • Railway and bus depots, taxi stands
Special Use	• None
Midway Commercial Residential (MCR) Zoning	
Transportation, Public and Utilities Land Use	
Principally Permitted	• WTF by administrative approval (For WTF towers 90 feet or less for a single user and up to 120 feet for two or more users. All WTFs are subject to applicable portions of KCC 15.08.035.)
Conditional	• Commercial parking lots or structures • Transportation and transit facilities, including high-capacity transit facilities (High-capacity transit facilities shall be consistent with Chapter 15.15 KCC.) • Railway bus depots, taxi stands • Utility and transportation facilities: electrical substations, pumping or regulating devices for the transmission of water, gas, steam, petroleum, etc. • Public facilities: firehouses, police stations, libraries, and administrative offices of governmental agencies, primary and secondary schools, vocational schools, and colleges • WTF (A conditional use permit for a WTF is required if it is greater than 90 feet for a single user or 120 feet for two or more users. All WTFs are subject to applicable portions of KCC 15.08.035.)
Accessory	• Accessory uses and structures customarily appurtenant to a permitted use • EV charging station (Level 1 and 2 charging only) • Rapid charging station
Not Permitted	• Transit operations and maintenance facilities
Special Use	• None

Table H2-4 Midway Landfill Alternative Zoning, City of Kent Permitted and Prohibited Uses (continued)

Single Family Residential (SR 6) Zoning	
Transportation, Public and Utilities Land Use	
Principally Permitted	• None
Conditional	• Transportation and transit facilities, including high-capacity transit facilities (High-capacity transit facilities shall be consistent with Chapter 15.15 KCC.) • Utility and transportation facilities: electrical substations, pumping or regulating devices for the transmission of water, gas, steam, petroleum, etc. • Public facilities: firehouses, police stations, libraries, and administrative offices of governmental agencies, primary and secondary schools, vocational schools, and colleges • WTF (If on property owned, leased, or otherwise controlled by the city or other government entity subject to KCC 15.08.035(I)
Accessory	• Accessory uses and structures customarily appurtenant to a permitted use (Accessory structures composed of at least two walls and a roof, not including accessory uses or structures customarily appurtenant to agricultural uses, are subject to the provisions of KCC 15.08.160.) • EV charging station (Level 1 and 2 charging only) • Rapid charging station (Only as part of a general conditional use identified in KCC 15.08.030.)
Not Permitted	• Commercial parking lots or structures • Transit operations and maintenance facilities • Railway and bus depots, taxi stands
Special Use	• None

1.4.3 Comprehensive Plan Policy Consistency

Table H2-5 Policy Consistency with City of Federal Way Comprehensive Plan

Topic	Goals	Policies	Consistency with Applicable Policies
2.6 Citywide Policies	No goals listed for these policies. This section includes an introduction stating that citywide policies apply to all Federal Way Comprehensive Plan designations. These general policies are intended to maintain the quality of the living and working environment and ensure that the interests, economy, and welfare of the community are considered.	• LUP 8: Designate and zone land to provide for Federal Way's share of regionally adopted demand forecasts for residential, commercial, and industrial uses for the next 20 years. • LUP 10: Support the continuation of a strong residential community.	Policy LUP 8: The addition of OMF South in commercial-oriented and multi-family residential zones would moderately reduce the amount of land available for these uses and if not replaced with additional zones, this could decrease the ability of Federal Way to meet future demand. The mainline tracks and a portion of the maintenance and operations facility of the Preferred Alternative would occupy approximately 54 acres of multi-family zoning. The mainline tracks and a portion of the operations and maintenance facility for the South 344th Street Alternative would occupy approximately 43 acres of multi-family zoning. Policy LUP 10: The Preferred and South 344th Street alternatives would occupy portions of a multi-family residential area (primarily including a mobile home park) which could affect a small portion of the existing residential community. However, the proposed uses would be similar in scale and use to a government facility or public utility, which are permitted in the area. The project areas adjacent to residential areas would include landscaped buffers, building setbacks, and other context-sensitive design features to help blend in with the residential areas.

Table H2-5 Policy Consistency with City of Federal Way Comprehensive Plan (continued)

Topic	Goals	Policies	Consistency with Applicable Policies
2.7 Land Use Designations (Single-Family)	Goal LUG3: Preserve and protect Federal Way's single-family neighborhoods. Goal LUG3.1: Provide a wide range of housing densities and types in the single-family designated areas.	• LUP14: Protect residential areas from impacts of adjacent non-residential uses. • LUP16: Encourage the development of transportation routes and facilities to serve single-family neighborhoods. Special attention should be given to pedestrian circulation.	Policy LUP14: The mainline tracks of the Preferred and South 344th Street alternatives would be located within a small portion of this zone and next to multi-family residential land uses. Sound Transit would take steps necessary to reduce its impact on adjacent parcels through building setbacks, landscaped buffers, and other building design features to support aesthetic compatibility between uses. Policy LUP16: The proposed project would support the expansion of light rail service and operations which supports the development of public transportation routes. The proposed light rail service provided by the Federal Way Link Extension (FWLE) includes a nearby station just north of the project alternatives and this station is expected to serve single-family neighborhoods surrounding the Federal Way alternatives.
2.7 Land Use Designations (Multi-Family)	Goal LUG4: Provide a wide range of housing types and densities. Commensurate with market demand, adopted housing targets, and the community's needs and preferences.	• LUP21: Support multi-family development with transportation and capital facilities improvements. • LUP23: Encourage the establishment of street patterns and amenities that encourage walking, bicycling, and transit use.	Policy LUP21: The OMF site will provide essential facilities for the maintenance of the light rail system which complements planned Transportation Capital Improvements Projects identified in Federal Way (such as the City Center Access Project). In addition, this project helps broaden transit options for multi-family households in the Federal Way area. Policy LUP23: The proposed conceptual design for the Preferred and South 344th Street alternatives would include the vacation of 20th Avenue S between S 336th Street and S 341st Street, which would prevent the planned, but unfunded, shared bicycle lane markings on 20th Avenue S from S 336th Street to S 341st Street from being developed. Alternative facilities could be developed to replicate the connectivity and function of the eliminated north-south connection.
2.7 Commercial Designations (General policies for Commercial, Office, and Commercial Enterprise)	None.	• LUP24: Provide employment and business opportunities by allocating adequate land for commercial, office, and industrial development. • LUP25: Encourage development of regional uses in the City Center.	Policies LUP24 and LUP25: The mainline tracks for the proposed project would require the conversion of a small area of the City Center Core zone (approximately 17 acres) and Commercial Enterprise zone (a range of 5 to 10 acres) to transportation uses. This could moderately reduce the amount of land available for employment and business opportunities, particularly if they are not replaced with additional commercial zones. However, the proposed project is expected to provide employment for up to approximately 610 total staff members. More detail is provided in *Chapter 3.5 Economics.* The proposed project also would support light rail service and operations (particularly by supporting the Tacoma Dome Link Extension and FWLE) which supports the development of regional public transportation routes and is expected to generally support development in the region.

Table H2-5 Policy Consistency with City of Federal Way Comprehensive Plan (continued)

Topic	Goals	Policies	Consistency with Applicable Policies
2.7 Commercial Designations (Commercial Enterprise)	Goal LUG5: Develop a quality commercial enterprise environment characterized by a viable, vibrant, and attractive mix of commercial, retail, office, industrial, and supportive uses and utilize locational and design criteria to ensure compatibility between uses.	• LUP35: Allow a broad range of commercial, retail, office, industrial, and supportive uses to meet the needs of workers and consumers, in well-integrated, well-functioning, high-quality developments. • LUP36: Require development to be compatible and well-integrated into its surroundings and adjacent zones through site and building design and development standards that reduce or eliminate land use conflicts and nuisance impacts; ensure project aesthetics; promote sharing of public facilities and services; and improve vehicular and pedestrian traffic flow and safety, including access control and off-street interconnectivity between adjoining properties where feasible. • LUP38: Do not allow heavy industrial uses on properties that adjoin residential zones.	Policy LUP35: The Preferred Alternative would consist of 12 acres of commercial zoned land, which is 1 percent of commercial zoned land within the city of Federal Way. The South 344th Alternative would consist of 41.6 acres of commercial zoned land, which is 3 percent of commercial zoned land in the city of Federal Way. As such, the proposed project is too small in size to impede the city from accommodating a broad range of commercial, retail, office, and industrial uses. Policy LUP36: While OMF South is expected to produce short-term construction-related impacts on adjacent parcels via noise, visual, etc.; long-term impacts are not expected, as the identified visual, noise, and air quality impacts for the project alternatives would not be severe enough to result in alteration of existing or potential future land uses. Sound Transit will strive to minimize any short-term impacts of constructing OMF South. The OMF project would likely contribute to improved vehicular and pedestrian traffic flow since it supports mode shifts from personal vehicles to transit services. Policy LUP38: OMF South would consist of maintenance facility buildings that are similar in scale and development intensity to light industrial uses. The city of Federal Way has not defined what a heavy industrial use is within the Federal Way Comprehensive Plan or in the city of Federal Way Revised Code (FWRC). The city of Federal Way has defined Industrial uses. Industrial uses allowed within the Commercial Enterprise zone (cited within FWRC 19.240.010 through 19.240.040) include manufacturing and production uses, warehouse, distribution, storage facility, truck stop, and automotive emissions testing facility uses, and commercial photography, communications, product testing, and industrial laundry facility uses. These uses are allowed so long as operations do not cause “inherent and recurring generated noise or vibration perceptible without instruments at any point along a property line, except transportation and delivery operations typically and customarily associated with the use; and provided, that such operations are not audible from a residential zone on a regular or recurring basis” (FWRC 19.240.010 through 19.240.040). According to Section 3.9, Noise and Vibration, there are no noise impacts to adjacent properties from the mainline tracks or OMF Site. The OMF Site would follow the guidelines of LUP38, given there are no noise impacts to residential properties. In addition, Sound Transit would take steps necessary to reduce the impact on adjacent parcels with residential uses through building setbacks, landscaped buffers, and other building design features to support aesthetic compatibility between uses.

Table H2-5 Policy Consistency with City of Federal Way Comprehensive Plan (continued)

Topic	Goals	Policies	Consistency with Applicable Policies
2.7 Commercial Designations (Community Business)	Goal LUG6: Transform Community Business areas into vital, attractive, areas with a mix of uses that appeal to pedestrians, motorists, and residents, and enhance the community's image.	- LUP39: Encourage transformation of the Pacific Highway (SR-99) Community Business corridors into quality retail/commercial mixed-use areas designed to integrate auto, pedestrian, and transit circulation, and to improve traffic flow and safety, including access control and off-street interconnectivity between adjoining properties where feasible. Continue to utilize Community Design Guidelines to ensure quality site and building design and functional and aesthetic compatibility between uses. Integration of pedestrian amenities and open space into retail and office development should also be encouraged. -	Policy LUP39: The project would be designed to ensure quality site and building design and aesthetic compatibility with surrounding uses.
2.10 Phasing	None.	- LUP60: Establish priority areas for public facility and service improvements, especially for transportation based on an adopted Capital Facilities Plan and Transportation Improvement Program. Priority areas should be located where public facility and service improvements are installed and an acceptable level of service is attained.	Policy LUP60: The OMF site will provide essential facilities for the maintenance of the light rail system. The light rail service will be developed to complement existing public transportation services.

Table H2-6 Policy Consistency with City of Kent Comprehensive Plan

Topic	Goals	Policies	Consistency with Applicable Policies
Urban Growth	Goal LU-2: Kent will locate public facilities and services with sensitivity to community needs and environmental conditions.	• Policy LU-2.1: Work with regional and state entities when public capital facilities are considered for location in or near the city to ensure that impacts and benefits are equitably dispersed. • Policy LU-2.2: Promote and support public transit, bicycle, and pedestrian circulation within compact urban settings.	Policy LU-2.1: The proposed OMF project is a publicly funded capital facility supporting light rail in the region. Sound Transit is committed to working with the city of Kent to ensure that impacts are reduced, and benefits of this public capital facility are as equitable as possible. Policy LU-2.2: OMF South would support the expansion and operation of public light rail transit, including FWLE, that will serve urban areas between Seattle and Tacoma, including the cities of Kent and Des Moines.
Commercial	Goal LU-10: Kent will examine the City's commercial districts based on the regional, community and neighborhood needs to support economic vitality and livability.	• Policy LU-11.2: Revise Kent Design and Construction Standards to ensure the public streetscape associated with commercial and mixed-use development is attractive, safe and supports transit, pedestrians, and cyclists.	Policy LU-11.2: The Midway Landfill parcel is located primarily on commercial land at the site of a former landfill.
Natural Resources	Goal LU-17: Kent will recognize the significant role the natural environment plays in shaping a sustainable community by contributing to human health, environmental justice, and economic vitality.	• Policy LU-17.2: Conserve energy resources, improve air and water quality and support healthy lifestyles by establishing well-designed, compact mixed-use land use patterns that provide convenient opportunities for travel by transit, foot, and bicycle.	Policy LU-17.2: The OMF project supports transit-friendly development patterns and would improve light rail service that is anticipated to provide a convenient way to travel for people located near the light rail corridors and stations.
Essential Public Facilities	Goal LU-20: The city shall participate in a cooperative inter-jurisdictional process to determine siting of essential public facilities of a county-wide, regional, or state-wide nature.	• Policy LU-20.1: Proposals for siting essential public facilities within the city of Kent or within the city's growth boundary shall be reviewed for consistency with the city's Comprehensive Plan during the initial stages of the proposal process. • Policy LU-20.2: When warranted by the special character of the essential facility, the city shall apply the regulations and criteria of Kent Zoning Code Section 15.04.150, Special Use Combining District, to applications for siting such facilities to ensure adequate review, including public participation. Conditions of approval, including design conditions, shall be imposed upon such uses in the interest of the welfare of the city and the protection of the environment. • Policy LU-20.3: In the principally permitted or conditional use sections of the zoning code, the city shall establish, as appropriate, locations and development standards for essential public facilities that do not warrant consideration through the Special Use Combining District regulations. Such facilities shall include but not be limited to small inpatient facilities and group homes.	Policies LUP-20.1 to LUP-20.3: OMF South is considered an Essential Public Facility. Most of the Midway Landfill Alternative is proposed for location on Commercial Manufacturing II zoning. The OMF site would be consistent with a recently passed Transit Operations and Maintenance Facilities Interim Zoning Ordinance conditionally allowing OMFs within the Commercial Manufacturing II zone (KCC 15.04.060); consequently, rezoning to the Special Use Combining District likely would be unwarranted. Sound Transit would work with the city to ensure consistency with city policies and plans.

Table H2-7 Policy Consistency with Midway Subarea Plan, City of Kent

Topic	Goals	Policies	Consistency with Applicable Policies
Land Use	Goal MLU-2: Promote a mix of land uses that support local and regional needs in an auto-oriented commercial and light industrial area along the Pacific Highway South commercial transportation corridor not designated Transit Oriented Community.	• Policy MLU-2.1: Allow a mix of retail, light industrial or live/work uses.	OMF South would consist of maintenance facility buildings that are similar in scale and development intensity as light industrial uses and would be consistent with the character intended for this area.
Transportation	Goal MT-3: Integrate high capacity light rail transit service and associated station locations into the urban design and functionality of the street systems.	• Policy MT-3.1: Work with Sound transit during all phases of planning for the extension of light rail into Midway to ensure Kent's preferred rail alignment and station location are realized. • Policy MT-3.6: Ensure proposed development is compatible with future light rail improvements by identifying and preserving rights-of-way necessary for future transportation projects.	OMF South is consistent with policies MT-3.1 and MT-3.6 since the policies are in support of light rail expansion and improvements. The OMF South project is being built to directly support the Sound Transit light rail operations and services in the city of Kent and in the surrounding region. OMF South is being designed to accommodate future light rail improvements.
Inter-jurisdictional Coordination	Goal MIC-2: Continue coordination with regional and state transportation agencies on matters of transportation investments planning and construction.	• Policy MIC-2.1: Coordinate with Sound Transit, King County, METRO, Washington State Department of Transportation, and Puget Sound Regional Council to ensure facilities and services are provided over time.	OMF South is consistent with policy MIC-2.1 since it will ensure coordination between Sound Transit and the city on OMF South planning and construction.

Table H2-8 Zones within Half-Mile Study Area: Preferred and South 344th Street Alternatives

Zone	General Zoning Description	Full Zone Name	Jurisdiction	Total Area (Acres)
BC	Commercial	Commercial Business	Federal Way	140
CE	Commercial	Commercial Enterprise	Federal Way	336
CP-1	Commercial	Corporate Park	Federal Way	364

Notes: The half-mile study area is based on the potential construction limits for each build alternative. The acreage is approximate, calculated using GIS tools. The areas within the project alternative footprint are not included in the information.

Table H2-10 Estimated Acres of Zoning Type to be Acquired

Alternative	Impact Type	Jurisdiction	Zoning Type	Zoning Category	Total Area (Acres)
Preferred	Mainline[1]	Federal Way	CE	Commercial	3
		Federal Way	RM3600	Residential	62
	OMF Site	Federal Way	BC	Commercial	3
		Federal Way	CE	Commercial	14
		Federal Way	RM2400	Residential	1
		Federal Way	RM3600	Residential	55
South 344th Street	Mainline[1]	Federal Way	CE	Commercial	25
		Federal Way	RM2400	Residential	1
		Federal Way	RM3600	Residential	64
	OMF Site	Federal Way	BC	Commercial	1
		Federal Way	CE	Commercial	36
		Federal Way	RM3600	Residential	48
Midway Landfill	OMF Site	Kent	CM	Commercial	69
		Kent	MCR	Mixed Use	25
		Kent	SR-6	Residential	3

Sources: The cities of Kent, Federal Way, and Des Moines and King County GIS data.

Note: The acreage is approximate, calculated using GIS tools, and conservatively assumes full acquisition of all affected parcels.

(1) The mainline tracks would be constructed regardless of which alternative is selected to be built. Under the Midway Landfill Alternative, the tracks would be constructed later, as part of the Tacoma Dome Link Extension project.

Operations and Maintenance Facility South

Appendix H3: Visual and Aesthetic Resources Technical Appendix

Federal Transit Administration

SoundTransit

APPENDIX H3: VISUAL AND AESTHETIC RESOURCES TECHNICAL APPENDIX

The visual analysis assesses the existing visual quality and character of the landscape and then considers how typical viewers may respond to what they see around them. Sound Transit adapted guidelines from the Federal Highway Administration (FHWA) and Washington State Department of Transportation (WSDOT) for this analysis. The FHWA guidelines provide a generally accepted methodology for preparing visual assessments for transportation projects and are appropriate for use on this project. Generally, assessment methods include defining viewsheds from where a build alternative can potentially be seen, characterizing the visual quality in landscape units within the viewshed, and selecting key observation points of the affected areas.

Visual and aesthetic impacts are defined by the extent to which the proposed project would change the environment in terms of visual quality and viewer sensitivity. According to guidance found in the Visual Impact Assessment for Highway Projects (FHWA 1988), the key terms for a visual impact analysis are defined as follows:

Visual quality refers to the evaluation of the visual experience of the public and is described in terms of vividness, intactness, and unity. *Vividness* refers to the way landscape components combine in distinctive and memorable visual patterns. *Intactness* refers to whether the natural and human-built visual patterns form a consistent landscape or whether highly contrasting features intrude into the view. *Unity* refers to the visual coherence and compositional harmony of the landscape considered as a whole. Visual character also informs visual quality; it refers to identifiable visual information, including visual elements and major environmental features.

Based on the considerations listed above, different levels of visual quality have been assigned to describe the viewsheds surrounding the project alternatives:

- **High Visual Quality** describes views with vivid, memorable, distinctive features in a landscape with compositional harmony, or where elements of the landscape fit together in a visual pattern that is free from encroaching visual elements that look out of place.
- **Medium Visual Quality** describes views with some unity or compositional harmony between elements of the landscape, where out-of-place visual elements do not substantially alter the perception of the landscape as a unit. These views lack vivid, memorable features and are generally characterized as common or ordinary.
- **Low Visual Quality** describes views that lack a dominant visual character, where views appear disorganized with features that seem out of place or views have some compositional harmony but include eyesore elements that can dominate one’s perception.

Viewer sensitivity refers to how viewers perceive the environment and what they find important. Viewer sensitivity can be affected by what the viewer is doing; the visual context; and the values, expectations, and interests of the viewer. Viewer exposure, which considers the number of viewers, where viewers are, and how long they are typically in a place, is also important to viewer sensitivity. For example, highway users driving by a site would have less exposure than surrounding neighbors.

For each potential viewer group within the study areas, viewer sensitivity is rated as high, medium, or low. High-sensitivity groups include viewers who highly value a particular view, and low-sensitivity groups include viewers who do not regard the visual setting as important to their activities. For example, residential viewers are typically in high-sensitivity groups, as well as persons driving for pleasure, tourists visiting an area to enjoy scenic features, and individuals engaged in recreation activities in parks or on trails. These viewers have a high awareness and sensitivity to their surroundings. People sightseeing on highways or driving through their neighborhood are considered to have medium to high viewer sensitivity. Commuters and other drivers primarily passing through an area are considered to have lower viewer sensitivity because they often become accustomed (and indifferent) to the views along their travel routes because of repetition and short viewing duration.

A medium sensitivity rating reflects the experience of people who view the visual context as a secondary feature of other activities. These could be people at work or shopping who may value a pleasant environment but are not at a location for the specific purpose of enjoying the scenery. Low viewer sensitivity generally describes the experience of persons engaged in activities that render the quality of their surroundings irrelevant or incidental. For example, drivers and vehicle occupants passing through an area are less sensitive to the visual context because they are focusing on features other than the surrounding landscape and generally have an average to low sensitivity.

Landscape units are geographic units in which visual quality impacts to viewers are assessed. Landscape units are defined both by viewshed area and landscape type and are generally visually homogenous (i.e., one viewshed and one landscape type). The landscape units encompassing the three Operations and Maintenance Facility (OMF) South build alternatives are defined by changes in topography, neighborhoods, streets, building types, and tree cover. The viewsheds within the landscape units range in width from half a block to 0.5 mile from the build alternatives.

Key observation points were selected within each landscape unit to illustrate views that are typical of the build alternatives, locations from where project features are particularly prominent, or views from sensitive viewpoints that would have views of the operating build alternative. At each key observation point, views of existing conditions are compared with simulated views of the build alternatives.

In addition, potential impacts to Resource Conservation Areas (formerly called “Beautification Areas”) along the Interstate 5 right-of-way were reviewed. These areas were originally acquired under the Highway Beautification Act of 1965 by FHWA and WSDOT for the “restoration, preservation and enhancement of scenic beauty adjacent to the highway.”

Operations and Maintenance Facility South

Appendix H4: Air Quality and Greenhouse Gas Technical Appendix

Federal Transit Administration

SOUNDTRANSIT

APPENDIX H4: AIR QUALITY AND GREENHOUSE GAS EMISSIONS TECHNICAL APPENDIX

1.1 Air Quality

Regional impacts on air quality would be caused by criteria air pollutants that would be emitted directly or indirectly as a result of the proposed project. “Criteria air pollutants” are six common air pollutants that can harm health and the environment, cause property damage, and are subject to certain federal air quality standards. Three agencies have jurisdiction over the ambient air quality in the Operations and Maintenance Facility (OMF) South study area: the U.S. Environmental Protection Agency (EPA), the Washington State Department of Ecology (Ecology), and the Puget Sound Clean Air Agency.

1.1.1 Federal Clean Air Act

The Federal Clean Air Act, as amended, is the primary federal law that governs air quality. These laws and related regulations by EPA set standards for the concentration of pollutants in the air, known as the National Ambient Air Quality Standards. National Ambient Air Quality Standards have been established for the six criteria pollutants, which include carbon monoxide; nitrogen dioxide; ozone; particulate matter (PM), which is broken down for regulatory purposes into particles of 10 micrometers and smaller (PM_{10}) and particles of 2.5 micrometers and smaller ($PM_{2.5}$); and sulfur dioxide. In addition, national standards exist for lead and air toxics.

The National Ambient Air Quality Standards are set at levels that protect public health with a margin of safety and are subject to periodic review and revision. Washington State adopts current federal National Ambient Air Quality Standards in state regulations, administered by Ecology. Applicable state and federal ambient air quality standards are shown in Table H4-1.

Based on monitoring information for criteria air pollutants collected over a period of years, Ecology and EPA designate regions as being attainment or nonattainment areas for the criteria pollutants. Once a nonattainment area achieves compliance with the National Ambient Air Quality Standards, the area is considered an air quality maintenance area. Although portions of the Puget Sound region are in maintenance areas for $PM_{2.5}$ and PM_{10}, none of the build alternative sites are located within the $PM_{2.5}$ or PM_{10} maintenance areas.

1.1.2 Washington Clean Air Act

The Washington Clean Air Act, Revised Code of Washington (RCW 70.94), sets forth the state law regarding outdoor air pollution and establishes a system of regional air pollution control authorities to implement federal and state air pollution control regulations. Air pollution control regulations cover the emission of air contaminants that are injurious to health or that unreasonably interfere with the enjoyment of life and property. In general, cities and towns cannot develop their own air pollution regulations. However, they can enact local nuisance provisions and performance standards so long as they are not less stringent than those of the regional authority. Many local governments have enacted general nuisance ordinances, which typically contain provisions aimed at such problems as illegal burning, dust, and noxious odors.

Table H4-1 Ambient Air Quality Standards

Pollutant[1]	National (Primary)	National (Secondary)	Washington State
Carbon Monoxide			
8-Hour Average	9 ppm	NS	9 ppm
1-Hour Average	35 ppm	NS	35 ppm
Ozone			
8-Hour Average	0.07 ppm	0.07 ppm	0.07 ppm
Lead			
Rolling 3-Month Average	0.15 µg/m^3	0.15 µg/m^3	0.15 µg/m^3
Nitrogen Dioxide			
Annual Arithmetic Mean	0.053 ppm	0.053 ppm	53 ppb
1-Hour Average[2]	100 ppb	NS	100 ppb
Particulate Matter (PM_{10})			
24-Hour Average[3]	150 µg/m^3	150 µg/m^3	150 µg/m^3
Particulate Matter ($PM_{2.5}$)			
Annual Arithmetic Mean	9 µg/m^3	15 µg/m^3	12 µg/m^3
24-Hour Average	35 µg/m^3	35 µg/m^3	35 µg/m^3
Sulfur Dioxide (SO_2)			
Annual Arithmetic Mean	NS	NS	0.02 ppm
24-hour	NS	NS	0.14 ppm
3-hour	NS	0.5 ppm	0.5 ppm
1-hour[4]	75 ppb	NS	75 ppb

Notes:
NS = No standard established
µg/m^3 = micrograms per cubic meter
ppm = parts per million
ppb = parts per billion
(1) Annual standards never to be exceeded; short-term standards not to be exceeded more than once a year unless noted.
(2) The 3-year average of the annual 98th percentile of daily maximum 1-hour averages is not to be above this level.
(3) Not to be above this level on more than 3 days over 3 years with daily sampling.
(4) The 3-year average of the annual 99th percentile of daily maximum 1-hour averages is not to be above this level.

1.2 Climate Change

Climate change refers to long-term changes in temperature, precipitation, wind patterns, and other elements of the earth's climate system. An ever-increasing body of scientific research attributes these climatological changes to greenhouse gas (GHG) emissions, particularly those generated from the production and use of fossil fuels, such as coal, oil, and natural gas.

While climate change has been a concern for several decades, the establishment of the Intergovernmental Panel on Climate Change by the United Nations and World Meteorological Organization in 1988 has led to increased efforts devoted to GHG emissions reduction and climate change research and policy. These efforts are primarily concerned with the emissions of GHGs generated by human activity.

In the U.S., the main source of GHG emissions is transportation, followed by electricity generation. The dominant GHG emitted is carbon dioxide, mostly from fossil fuel combustion. There are four primary strategies for reducing GHG emissions from transportation sources: 1) improving the transportation system and operational efficiencies, 2) reducing passenger vehicle travel activity, 3) transitioning to lower GHG-emitting fuels, and 4) improving vehicle technologies/efficiency. To be most effective, all four strategies should be pursued cooperatively.

1.2.1 Washington State Greenhouse Gas Reduction Goals

In 2020, Washington State adopted House Bill 2331 (HB 2331), which revised the state's GHG reduction goals. Under HB 2331, Washington must limit emission of GHGs to achieve the following reductions for the state:

- By 2020, reduce overall emissions of GHGs in the state to 1990 levels.
- By 2030, reduce GHG emissions to 45 percent below 1990 levels.
- By 2040, reduce overall emissions of GHGs in the state to 70 percent below 1990 levels.
- By 2050, reduce overall emissions of GHGs in the state to 95 percent below 1990 levels, and achieve net zero GHG emissions.

In addition, Sound Transit's Sustainability Plan, most recently updated in 2019, commits Sound Transit to integrating efficient operating practices at existing and new facilities, using energy-saving equipment to reduce energy demand, and maximizing intermodal transit connections to reduce automobile travel (Sound Transit 2019). The 2019 update includes goals focused on sustainable building and infrastructure and opportunities for transit-oriented development.

1.2.2 Climate Conditions and Local Air Quality

Washington is located on a windward coast in the mid-latitudes, producing a predominantly marine-type climate west of the Cascade Mountains. East of the Cascades, the climate possesses both continental and marine characteristics. The Puget Sound region's climate is mild, with wet and cloudy winters and cool and comparatively dry summers. In the interior valleys, measurable rainfall is recorded on 150 days each year; in the mountains and along the coast, there is rain 190 days each year.

Prevailing winds are typically from the south or southwest during the winter and from the north or northeast during the summer. Wind speeds are generally sufficient to disperse air pollutants released into the atmosphere. Air pollution is most noticeable in the late fall and winter under conditions of clear skies and light winds.

Typical air pollution sources near the study area include vehicular traffic, commercial and retail businesses, light industry, and residential wood-burning devices. While many types of pollutant sources are present, the largest contributors of criteria pollutant emissions are on-road vehicles, which contribute the majority of the carbon monoxide and ozone precursors. Secondary sources of emissions are commercial and industrial land uses.

APPENDIX H5: WATER RESOURCES TECHNICAL APPENDIX

Listed below are the federal, state, and local regulations that govern the protection or use of water resources in the study area that are applicable to the activities of the Operations and Maintenance Facility South project. Local plans and/or policies that guide the use of water resources in the study area are also included. If a regulation, plan, or policy is updated to a newer version than what is listed below, the most recent version that is legally applicable to the project is used in the environmental analysis.

1.1 Federal

- Clean Water Act:
  - Section 401 (33 United States Code [USC] § 1341) – Water Quality Certification (delegated authority to the Environmental Protection Agency [EPA], Tribe, and/or state)
  - Section 402 (33 USC § 1342) – National Pollutant Discharge Elimination System (NPDES)
  - Section 404 (33 USC § 1344) – Permits for Dredge or Fill
- Coastal Zone Management Act, 16 USC 1451 et seq.
- National Flood Insurance Act of 1968 and Flood Disaster Protection Act of 1973, 42 USC 4001 et seq.
- Floodplain Management Presidential Executive Order 11988 of May 24, 1977, and its subsequent updates (Executive Orders 13690 and 14030)
- Endangered Species Act Biological Opinion for the Implementation of the National Flood Insurance Program in the State of Washington (National Marine Fisheries Service 2008)
- Safe Drinking Water Act, 42 USC 300f et seq., Chapter 6A
- FTA Region 10 Standard Operating Procedures No. 22 Water Resources

1.2 State

- Water Quality Standards for Surface Waters, Washington Administrative Code (WAC) 173-201A
- Water Quality Standards for Groundwater, WAC 173-200
- Water Pollution Control Act, Revised Code of Washington (RCW) 90.48
- Washington State Hydraulic Code, WAC 220-660
- Flood Control Management Act, RCW 86
- Shoreline Management Act, RCW 90.58, WAC 173-18 and WAC 173-26
- NPDES Western Washington Phase I and Phase II Municipal Stormwater General Permits (Ecology 2019a)
- NPDES Construction Stormwater General Permit (Ecology 2021)
- Stormwater Management Manual for Western Washington (Ecology Manual) (Ecology 2019b)
- Washington State Department of Transportation (WSDOT) Highway Runoff Manual (WSDOT 2019)
- WSDOT Hydraulics Manual (WSDOT 2023)

1.3 Regional

- Sound Transit Link Design Criteria Manual, Revision 5 (Sound Transit 2021)
- Low Impact Development Technical Guidance Manual for Puget Sound (Puget Sound Partnership 2012)

1.4 Local

1.4.1 City of Federal Way

- Shoreline Management, Federal Way Revised Code (FWRC) 15.05
- Critical Areas, FWRC 15.10
- Surface Water Management, Title 16 FWRC
- Zoning and Development – Environmentally Critical Areas, FWRC 19.145
- King County Surface Water Design Manual (King County 2021a)
- Federal Way Addendum to the King County Surface Water Design Manual (City of Federal Way 2017)
- King County Stormwater Pollution Prevention Manual (King County 2021b)

1.4.2 City of Kent

- Surface Water and Drainage Code, Kent City Code (KCC) 7.07
- Shoreline Master Program, KCC 11.04
- Critical Areas, KCC 11.06
- Surface Water Design Manual (City of Kent 2022)

Operations and Maintenance Facility South

Final Environmental Impact Statement

Appendix I: Biological Assessment

Federal Transit Administration

SoundTransit

June 2024

Executive Summary

The Central Puget Sound Regional Transit Authority (Sound Transit) proposes to construct a new regional operations and maintenance facility (OMF) to serve its systemwide light rail expansions, including those into South King County and Pierce County. The Federal Transit Administration (FTA) and Sound Transit are currently conducting environmental review for the proposed OMF South project. FTA and Sound Transit are studying three alternatives. The Sound Transit Board identified the S 336th Street alternative as the Preferred Alternative in December 2021. The facility will require an expansion of the regional light rail system south from the terminus of the Federal Way Link Extension (FWLE) at the Federal Way Downtown Station to the location of the Preferred Alternative OMF facility site between S 336th Street and S 341st Place in the city of Federal Way, Washington. This Preferred Alternative is the proposed action described in this document as the OMF South project.

In addition to guideway construction and construction of the OMF South facility, the project will include new roadway construction, roadway frontage improvements, culvert removal/replacements, stream realignment, stormwater facilities, and mitigation for wetland, stream and associated buffer impacts.

Major project elements will include the following:

- Construction and operation of the OMF South facility, including the following:
  - Runaround tracks
  - Storage tracks sized for approximately 144 light rail vehicles (LRVs)
  - Maintenance building with service lanes for vehicle maintenance, repair, carwash, cleaning, painting, spare parts storage, operations, and administration
  - Yard area for outside storage
  - Maintenance of Way (MOW) building for indoor maintenance and storage of spare parts for tracks, vehicle propulsion equipment, train signals, and other infrastructure
  - Training track that includes all the track installation configurations found in the Link system
  - Link System-Wide Storage (LSWS) building for receiving and indoor storing all parts of the Link light rail system, including LRV parts and components, MOW track and components, and Facilities Station parts and components
  - A traction power substation (TPSS) to boost the power to the overhead catenary system that powers the LRVs
  - Offices, locker rooms, lunchrooms, and other spaces for employees
  - Auto/truck access points
  - Employee, Sound Transit vehicle (nonrevenue vehicle), and visitor parking
  - Construction and operation of lead track connecting the OMF South facility with mainline and test tracks. The lead tracks will be on an elevated guideway. Elevated lead tracks would leave the northeast corner of the site and be approximately 600 feet long. Similarly, a pair of approximately 1,030-foot-long, elevated lead tracks would leave the southeast corner of the site to access the mainline tail tracks.
- Construction and operation of 1.4 miles of mainline track extending from the Federal Way Downtown Station to its end point at S 344th Street. In the future, this track would continue

south as part of the planned Tacoma Dome Link Extension (TDLE) project. The mainline track (guideway) will include at-grade, elevated, retained fill, and retained cut segments.

- Construction of 0.9 mile of test track running parallel and east of the mainline track (along I-5) from S 324th Street to just south of S 336th Street. The test track (guideway) will include at-grade, elevated, retained fill, and retained cut segments. Approximately 0.5 mile of access road will be constructed parallel with and on the west side of the test track.
- Construction of permanent treatment and flow control BMPs, as appropriate, for all new and replaced impervious surfaces
- Roadway improvements including replacements of culverts with fish-passable structures
- Stream relocation and daylighting activities

The project will create in-air noise, and it may increase suspended sediment loads during construction, as well as resulting in removal of forested wetland and riparian habitats. During operation, the project will discharge stormwater into municipal separate stormwater systems and receiving waters and streams in the Hylebos Creek watershed. The project will add 1.27 acres of pollution generating impervious surface (PGIS) area to the Hylebos Creek watershed but will provide water quality treatment for all new and replaced of PGIS, as well as a substantial amount of non-pollution generating impervious surface (NPGIS) in the project area.

The project includes up to three culvert replacements and one culvert removal (stream daylighting) as described below:

- Replacement of two culverts (WDFW Site ID numbers 933224 and 935274) will occur on a headwater tributary to East Fork Hylebos Creek (East Fork Hylebos Creek Tributary 0016A) at the current S 336th Street and S 344th Street stream crossings.
- Replacement of one culvert (WDFW Site ID number 935060) will occur on a headwater tributary to West Fork Hylebos Creek (West Fork Hylebos Creek Tributary 0014C) at the current S 336th Street stream crossing.
- Removal of one culvert (WDFW Site ID number 935271) will occur on East Fork Hylebos Creek Tributary 0016A and adjacent to a Washington State Department of Transportation (WSDOT) stormwater facility north of S 344th Street and within the WSDOT right of way (ROW).

One of these culverts identified above (935271) is currently on the list of WSDOT culverts that must be replaced under a 2013 federal court injunction requiring the correction of state-owned culverts in western Washington that block habitat for salmon and steelhead. The project design includes the removal of this culvert and daylighting the stream channel, plus the replacement of the three City of Federal Way-owned culverts (933224, 935274, and 935060).

The replacement crossing structures will be sized and configured to prevent them from becoming barriers in the future. The structures will be designed using the design criteria from WDFW’s 2013 Water Crossing Design Guidelines. The design of the structures will be determined through hydraulic, geotechnical, and structural engineering evaluations.

The project will remove/replace approximately 890- feet of culverted stream with approximately 520 feet of fish-passable culverts, and it will daylight approximately 570 linear feet of channel. Removing all four barriers will improve access to approximately 3.3 miles of stream habitat.

The project will avoid or minimize potential effects on Endangered Species Act-listed (ESA-listed) species and their habitats. No suitable habitat for ESA-listed terrestrial species is present in the terrestrial zone of effect within the action area, and stream reaches within 1.5 miles of the project limits are largely inaccessible to fish due to humanmade barriers downstream. No critical habitat for any ESA-listed species is present within 1 mile of the project limits. As such, the project is expected to have no direct effects on ESA-listed species or critical habitat. However, contaminants in stormwater runoff discharged to the municipal separate stormwater system and streams in and near the project limits may degrade water quality in downstream waters where ESA-listed fish and critical habitat are present. The proposed treatment strategy will reduce the frequency and intensity of exposure of ESA-listed fish to contaminants that may remain in treated stormwater compared to existing conditions. The aquatic zone of effect within the action area will therefore include East Fork Hylebos Creek Tributary 0016A and West Fork Hylebos Creek Tributary 0014C extending from the project limits downstream to where the mainstem Hylebos Creek enters the marine waters of the Hylebos Waterway as well as the upstream extents of both streams as a result of improving access to that habitat via removal of fish passage barriers.

The project may contribute to the long-term recovery of ESA-listed fish species by correcting barriers to fish migration in headwater reaches of East Fork Hylebos Creek Tributary 0016A and West Fork Hylebos Creek Tributary 0014C. After downstream barriers are corrected, these improvements will increase the amount of habitat accessible to anadromous salmonids.

Table ES-1 identifies the species and critical habitat addressed in this biological assessment (BA), and it summarizes the effect determinations. Table ES-2 summarizes project effects on essential fish habitat (EFH) for Pacific salmon, groundfish, and coastal pelagic species. The EFH assessment is included as Appendix A.

Table ES-1 ESA-Listed Species, Critical Habitats, and Recommended Determinations

Species[(1)]	Federal Jurisdiction	ESA Listing Status	Species Effect Determination	Critical Habitat Status	Critical Habitat Effect Determination
Streaked horned lark (*Eremophila alpestris strigata*)	USFWS	Threatened	No Effect	Designated; none in action area	No Effect
Yellow-billed cuckoo, Western U.S. Distinct Population Segment (DPS) (*Coccyzus americanus*)	USFWS	Threatened	No Effect	Designated; none in action area	No Effect
Marbled murrelet (*Brachyramphus marmoratus*)	USFWS	Threatened	No Effect	Designated; none in action area	No Effect
Taylor's checkerspot (*Euphydryas editha taylori*)	USFWS	Endangered	No Effect	Designated; none in action area	No Effect
Gray wolf (*Canis lupus*)	USFWS	Endangered	No Effect	None Designated	Not Applicable
North American wolverine (*Gulo gulo luscus*)	USFWS	Threatened	No Effect	None Proposed	Not Applicable
Bull trout (*Salvelinus confluentus*)	USFWS	Threatened	Not Likely to Adversely Affect	Designated; none in action area	No Effect
Chinook salmon, Puget Sound Evolutionarily Significant Unit (ESU) (*Oncorhynchus tshawytscha*)	NMFS	Threatened	Likely to Adversely Affect	Designated within the action area	Likely to Adversely Affect

Table ES-1 ESA-Listed Species, Critical Habitats, and Recommended Determinations (continued)

Species(1)	Federal Jurisdiction	ESA Listing Status	Species Effect Determination	Critical Habitat Status	Critical Habitat Effect Determination
Steelhead, Puget Sound DPS (*Oncorhynchus mykiss*)	NMFS	Threatened	Likely to Adversely Affect	Designated within the action area	Likely to Adversely Affect
Bocaccio, Puget Sound/ Georgia Basin DPS (*Sebastes paucispinis*)	NMFS	Endangered	Not Likely to Adversely Affect	Designated; none in action area	No Effect
Yelloweye rockfish Puget Sound/Georgia Basin DPS	NMFS	Threatened	Not Likely to Adversely Affect	Designated; none in action area	No Effect
Killer whale, Southern Resident DPS (*Orcinus orca*)	NMFS	Endangered	Not Likely to Adversely Affect	Designated; none in action area	Not Likely to Adversely Affect

Notes:
(1) ESU = evolutionarily significant unit; DPS = distinct population segment

Table ES-2 Effect Determinations for Essential Fish Habitat

Fishery	Effect Determination
Pacific Salmon	May Adversely Affect
Groundfish	May Adversely Affect
Coastal pelagic species	No Adverse Effect

1 INTRODUCTION AND PROJECT DESCRIPTION

The Central Puget Sound Regional Transit Authority (Sound Transit) proposes to construct a new regional operations and maintenance facility (OMF) to serve its planned systemwide light rail expansions, including those into South King County and Pierce County. The proposed action is known as the Operations and Maintenance Facility South (OMF South) project (Figure 1-1). The Federal Transit Administration (FTA) and Sound Transit are currently conducting environmental review for the OMF South project. FTA and Sound Transit are studying three alternatives. The Sound Transit Board identified the S 336th Street alternative as the Preferred Alternative in December 2021. For the purposes of this BA, the Preferred Alternative is the proposed action that is under consideration and is herein after referred to as the OMF South project. The OMF South project will require an expansion of the regional light rail system south from the terminus of the Federal Way Link Extension (FWLE) at the Federal Way Downtown Station to the OMF South facility site between S 336th Street and S 341st Place in the city of Federal Way, Washington. The project is also located immediately west of, and parallel with, the Interstate 5 (I-5) corridor. The proposed action (project) is part of the Sound Transit 3 Plan, which voters approved funding for in 2016.

The OMF South project supports Sound Transit’s Link light rail system expansion and the related increase in its light rail vehicle fleet and daily operations. The project includes measures to preserve and promote a healthy and sustainable environment by minimizing adverse impacts to people and the natural and built environments. The purpose of the OMF South is as follows:

- Provide a facility with the capacity to receive, test, commission, store, maintain, and deploy vehicles to support the intended level of service for the system-wide Link light rail system expansion.
- Support efficient and reliable Link light rail service that minimizes system operating costs.
- Support and connect efficiently to the regional system and be technically and financially feasible to build, operate, and maintain, consistent with the Sound Transit 3 Plan and Sound Transit’s Regional Transit Long-Range Plan.

The project is needed for the following reasons:

- The current regional system lacks a facility with enough capacity and a suitable location to support the efficient and reliable long-term operations for system-wide light rail expansion, including the next phase of expansion in King and Pierce Counties.
- New light rail maintenance and storage capacity has to be available with enough time to accept delivery of and commission new vehicles to both meet fleet expansion needs and store existing vehicles while the new vehicles are tested and prepared.

The purpose of this biological assessment (BA) is to evaluate the potential effects of the proposed action on federally listed and proposed species and designated critical habitat in accord with the provisions of Section 7 of the Endangered Species Act (ESA) of 1973, as amended (ESA; 16 United States Code [USC] §§1531-1543). Section 7(a)(2) of the ESA specifies that each federal agency shall, in consultation with the National Marine Fisheries Service (NMFS) and the U.S. Fish and Wildlife Service (USFWS), ensure that any action authorized, funded, or carried out by such agency is not likely to jeopardize the continued existence of an endangered or threatened species or result in the destruction or adverse modification of critical habitat. This BA also analyzes effects on essential fish habitat (EFH) under the provisions of the Magnuson-Stevens Fishery Conservation and Management Act (see Appendix A).

Biological Assessment

OMF South

DRAFT: For internal discussion only. Not reviewed or approved on behalf of any party.

Sound Transit has prepared this BA to facilitate consultation between the FTA, NMFS, and USFWS under Section 7 of the ESA. The primary federal nexus for this project is federal aid funding provided by FTA. In addition, the proposed action will also require a permit from the U.S. Army Corps of Engineers (Corps) and approval from the Federal Highway Administration (FHWA) for use of the limited access right-of-way along I-5. In addition, the proposed action will result in the relocation of a Bonneville Power Administration (BPA) electric power transmission tower and transmission lines. BPA will consult on this action separately. This BA supports the ESA Section 7 compliance requirements for all federal agencies.

1.1 Background and Consultation History

A Pre-BA meeting was held on August 24, 2023, and included representatives from USFWS, NMFS, FTA, and Sound Transit. Notes from the pre-BA meetings are included in Appendix B. Topics covered during the meeting included stormwater management, injunction culverts, known fish use and existing barriers, and the effects of N-(1,3-Dimethylbutyl)-N'-phenyl-p-phenylenediamine-quinone (6PPD-quinone) on ESA-listed fish.

The meeting included a brief discussion of the OMF South purpose and need followed by a description of the project and schedule; action area; species addressed; existing habitat conditions; direct and indirect effects; and provisional effect determinations for listed species, critical habitat, and EFH. Overall, there was preliminary agreement on the effects determinations provided except for bocaccio and yelloweye rockfish. The provisional effect determination for both species was identified as "no effect." However, because of the potential presence of larval rockfish within the lower tidally influenced portion of Hylebos Creek and the potential for exposure to stormwater related contaminants, NMFS staff indicated that a "may affect, not likely to adversely affect" was warranted. The USFWS indicated that if project related mitigation were to include any in-water work, then the effect determination for bull trout, would likely need to be elevated. Currently the effect determination for bull trout is "may affect, not likely to adversely affect."

1.2 Project Location

The project is located entirely within the city of Federal Way, Washington (NW1/4 Section 21, Township 21N, Range 04 East: NW and SW ¼ Section 16, Township 21 North, Range 04 East). The project is contained within Water Resource Inventory Area (WRIA) 10, the Puyallup White Watershed (6th Field Hydrologic Unit Code (HUC) 17110019025 – Hylebos Creek -Frontal Commencement Bay).

The proposed OMF South project is located between S 336th Street and S 341st Place and between Interstate-5 (I-5) and State Route 99 (SR 99). The OMF South project includes connections to the terminus of the Federal Way Link Extension (FWLE) at the Federal Way Downtown Station by a guideway that will extend from the Federal Way Downtown Station to S 344th Street. Figure 1-1 shows the location of the OMF South facility and the associated mainline, lead, and test tracks.

1.3 Project Description

OMF sites are necessary throughout Sound Transit's light rail network to clean, store, maintain, and deploy light rail vehicles (LRVs) (Figure 1-2). The OMF South would also require construction of mainline track to connect with the terminus of FWLE at the Federal Way

Downtown Station (opening in 2026) to the north and the planned future Tacoma Dome Link Extension (TDLE) to the south.

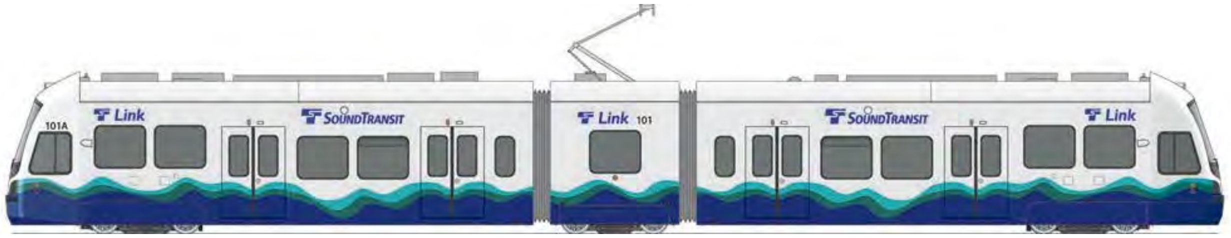

Figure 1-2 Example Light Rail Vehicle

Major project elements will include the following:

- Construction and operation of the OMF South facility, including the following:
  - Runaround tracks
  - Storage tracks sized for a minimum of 144 light rail vehicles (LRVs)
  - Maintenance building with service lanes for vehicle maintenance, repair, carwash, cleaning, painting, spare parts storage, operations, and administration
  - Yard area for outside storage
  - Maintenance of Way (MOW) building for indoor maintenance and storage of spare parts for tracks, vehicle propulsion equipment, train signals, and other infrastructure
  - Training track that includes all the track installation configurations found in the Link system
  - Link System-Wide Storage (LSWS) building for receiving and indoor storing all parts of the Link light rail system, including LRV parts and components, MOW track and components, and Facilities Station parts and components
  - A traction power substation (TPSS) to boost the power to the overhead catenary system that powers the LRVs
  - Offices, locker rooms, lunchrooms, and other spaces for employees
  - Auto/truck access points
  - Employee, Sound Transit vehicle (nonrevenue vehicle), and visitor parking
  - Construction and operation of lead track connecting the OMF South facility with mainline and test tracks. The lead tracks will be on an elevated guideway. Elevated lead tracks would leave the northeast corner of the site and be approximately 600 feet long. Similarly, a pair of approximately 1,030-foot-long, elevated lead tracks would leave the southeast corner of the site to access the mainline tail tracks.
- Construction and operation of 1.4 miles of mainline track extending from the Federal Way Downtown Station to its end point at S 344th Street. In the future, this track would continue south as part of the planned Tacoma Dome Link Extension (TDLE project). The mainline track (guideway) will include at-grade, elevated, retained fill, and retained cut segments.
- Construction of 0.9 mile of test track running parallel and east of the mainline track (along I-5) from S 324th Street to just south of S 336th Street. The test track (guideway) will include at-grade, elevated, retained fill, and retained cut segments. Approximately 0.5 mile of access road will be constructed parallel with and on the west side of the test track.

- Construction of permanent treatment and flow control BMPs, as appropriate, for all new and replaced impervious surfaces
- Roadway improvements including replacing culverts with fish passable structures
- Stream relocation and daylighting activities
- Mitigation for wetland and stream impacts

Project elements are shown in Figure 1-3 and Figure 1-4 except for mitigation. Potential mitigation sites are still being selected but for the purpose of this document, all on-site and off-site mitigation opportunities will be located in the Hylebos Creek watershed. More detailed descriptions of major project elements are included in the following sections.

1.3.1 OMF South Site

The OMF South facility site is approximately 66 acres. It will include the maintenance building, the MOW building, the Link System-Wide Storage Building, storage tracks, parking, training tracks, lead tracks, and yard areas. There will be approximately 480 parking spaces, including spaces for employees, visitors, accessible parking, and nonrevenue Sound Transit vehicles. The yard area will be approximately 5.7 acres. Figure 1-5 provides more detail on location of specific OMF South facilities.

The project will also require lead tracks for LRVs to access the mainline tracks. Two elevated lead tracks will extend from the northeast corner of the site to the mainline tracks, and they will each be approximately 600 feet long. Similarly, two elevated tracks, each approximately 1,000 feet long, will extend from the southeast corner of the site connecting to the tail tracks.

Construction of the project will require modifications to local roadway systems, including replacing 20th Avenue S along the east side of the site with an extension of 18th Place S from 336th Street to 340th Street along the west side of the site. Additionally, 21st Avenue South will be extended southward to a new intersection with S 344th Street. Transportation related project elements are discussed further in Section 1.3.4.

1.3.2 Light Rail Guideway and Associated Tracks

The light rail guideway width will vary. In areas with two tracks, the width will be from 30 to 40 feet wide. In areas with three to four parallel tracks, the width will be from 50 to 60 feet wide. The transit right-of-way will include room for poles and the overhead catenary system needed to power the trains. Some sections of the right-of-way will be wider to accommodate TPSSs, signal bungalows, maintenance driveways, and emergency access points, with walls or barriers to restrict other access. The test track constructed along I-5 will require construction of a new limited access road. Elevated structures will require support columns or other bridging support structures. For at-grade guideway in areas with slopes, retaining walls might be needed where the alignment will cut into an adjacent hillside, or to support fill material below the guideway. In some places, sound walls will be added to the guideway or to retaining walls to reduce noise impacts. Table 1-1 identifies the approximate length for the different track profile types. The structure types are described below, and cross-sectional views of the guideway profiles can be found in Appendix C.

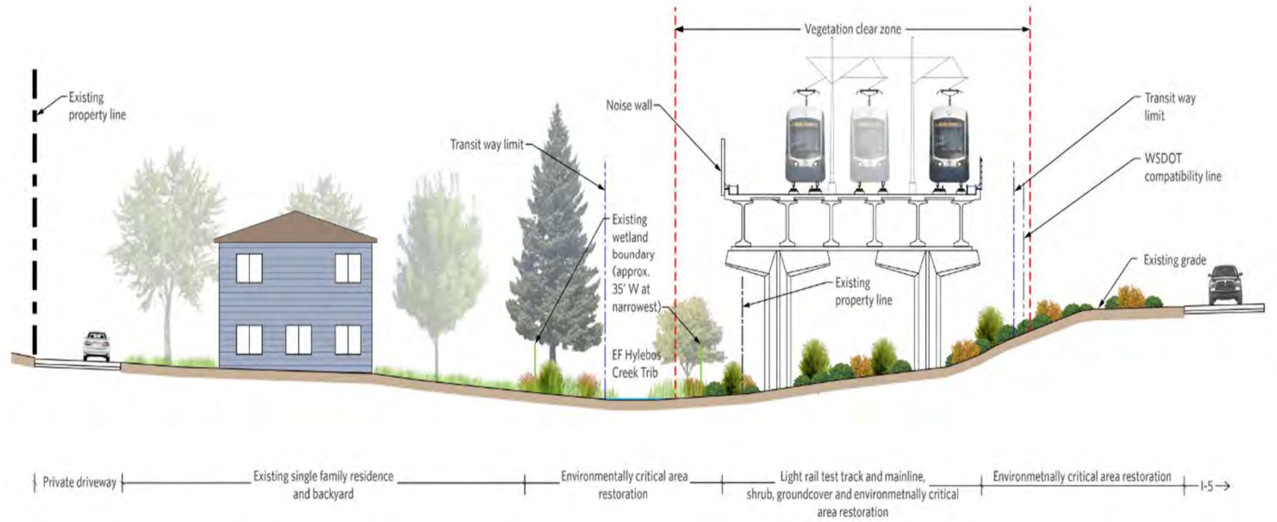
Table 1-1 Light Rail Guideway Types and Length

Light Rail Guideway Profile Type	Length (ft)
Elevated Guideway	
Elevated Mainline Guideway	3,500
Elevated Triple Track (Mainline and Test Track)	680
Elevated Four Track (Mainline, Test, and Lead Track)	840
At-Grade Guideway	
At-grade Triple Track	400
At Grade Independent Test Track	190
At-grade Mainline and Independent Test Track	1,060
Retained Cut/Retained Fill Guideway	
Triple Track Mainline – Mainline on retained fill (RF) and Test Track on Retained Cut (RC)	370
RF Triple Track	1,020
RF Independent Test Track	100

Safety considerations require that vegetation be cleared near all guideways, necessitating a tree-clear zone within 20 feet of the structure at the time of construction. After construction, low growing vegetation such as native shrubs can be planted within the permanent tree-clear zone in critical areas and stream buffers, which will typically extend approximately 15 feet on either side of the guideway tracks (Figure 1-6).



Vegetation clear zone
Existing property line
Noise wall
Transit way limit
Transit way limit
WSDOT compatibility line
Existing wetland boundary (approx. 35' W at narrowest)
Existing property line

Existing single family residence and backyard
Environmentally critical area restoration
Light rail test track and mainline, shrub, groundcover and environmetnally critical area restoration
Environmetnally critical area restoration
I-5

Figure 1-6 Example Vegetation Clearing Zone

The total width of the guideway (elevated or at grade) will vary between 30 and 60 feet wide; adding the clear zone to this width will result in an approximately 60- to 90-foot-wide area in which vegetation will be restricted to no vegetation or low-growing species. Vegetation within the footprint of at-grade guideway will be permanently removed. Regulations also require at least 5 feet of vertical clearance between the tops of mature plants and the bottom of any elevated structures. Vegetation outside the guideway will be pruned back to a clear zone between the edge of the guideway and the edge of the tree canopy. Where tree heights will reach above the height of the safety railing, a larger clear zone must be provided that will extend from the edge of the guideway to the edge of the tree canopy. In general, vegetation growth beneath elevated guideway, outside of sensitive or critical areas and associated buffers, is limited to allow for access and minimize long-term maintenance.

1.3.2.1 Elevated Guideway

An elevated guideway must have at least 16.5 feet of vertical clearance over roadways, but existing topography and other considerations can result in a profile as high as 50 feet or more. Pier supports holding up the guideway are typically about 10 feet in diameter at the ground; the underground support structure may consist of four 10-foot columns with a concrete foundation as large as 50 feet by 50 feet on top of the piles. An elevated guideway can travel, along the side of the roadway, or in off-street corridors. Approximately one-half of the guideway through the OMF South corridor is elevated. Figure 1-7 provides an example of an elevated profile under construction. Elevated guideway profiles along the alignment will include both double-, triple-, and four-track profiles with the double-track profile consisting of a mainline track in both the north and south directions. The triple-track profile will include the mainline tracks and test track, and the four-track profile will include the mainline tracks, test track and the lead track. Examples of elevated guideway profiles along the alignment can be found in Appendix C.

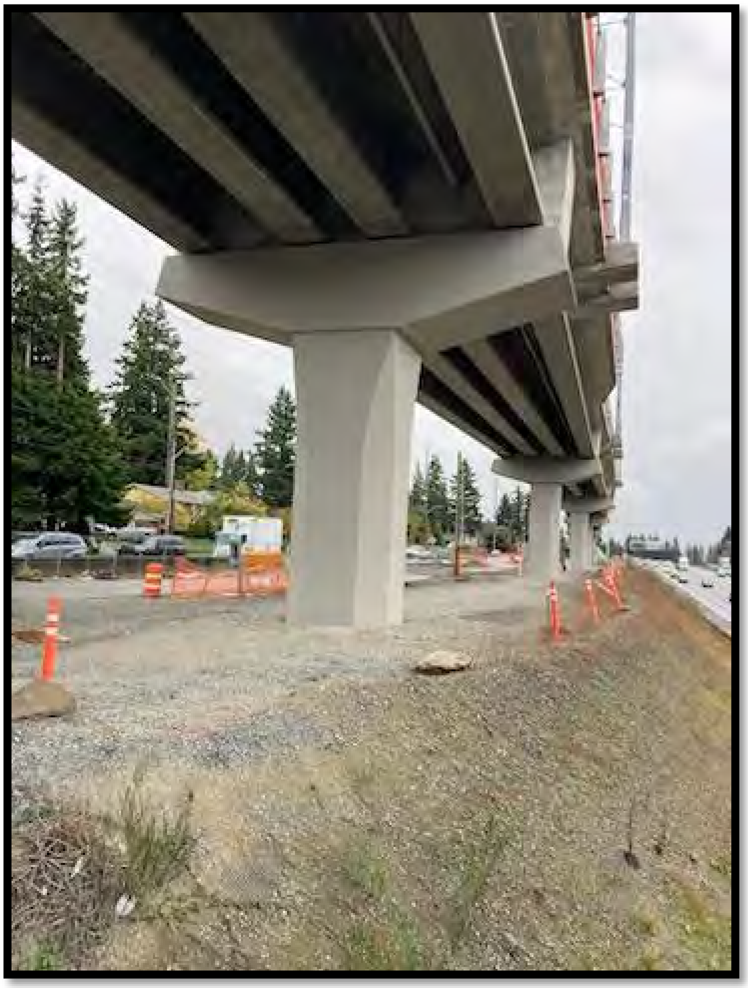

Figure 1-7 Construction of an Elevated Guideway

Construction of an elevated guideway will involve demolition of structures, clearing, grading, relocating utilities, preparing necessary construction access, and building the guideway structure. A temporary construction road will typically be built for constructing elevated guideways in undeveloped areas or where access is not available from existing roads. Constructing an elevated guideway within existing street rights of way may require temporary closure of some traffic lanes and detours.

Elevated guideways, similar to structures such as highway bridges, are generally reinforced concrete, steel, or combinations of both. Construction will begin with preparation work to build foundations, which may consist of shallow spread footings, deep-driven or augured piles, or drilled shafts. Once foundations are in place, concrete columns will be constructed. The elevated superstructure could be steel, cast-in-place concrete, precast concrete, or segmental concrete. If steel and cast-in-place concrete are used, temporary support structures referred to as false-work could be required to support the superstructure while the concrete is poured and while the cast concrete gains enough strength during curing to support itself, or while the steel beams are joined through welding or bolting (Figure 1-8).

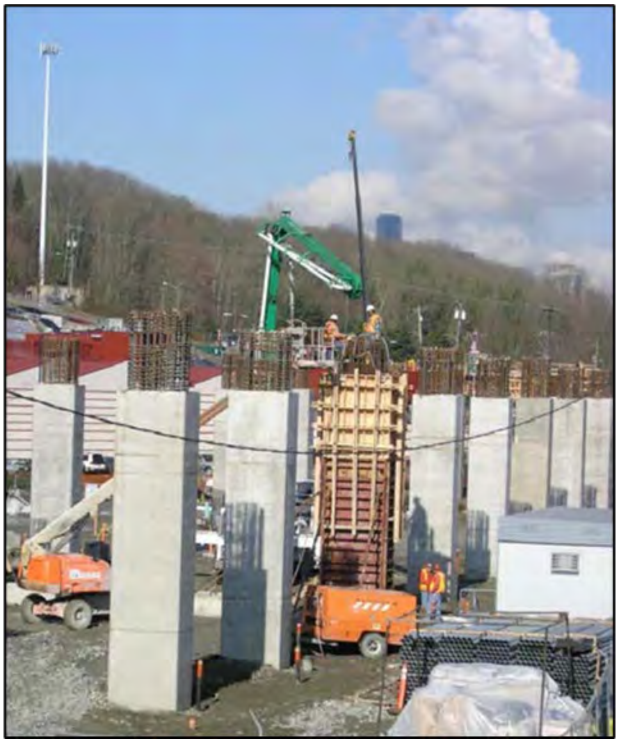

Figure 1-8 Falsework Columns Under Construction

If the elevated guideway is close to or within a roadway, the false work will require temporary lane closures and traffic detours until enough of the elevated structure is complete. Precast girder construction is expected to be the primary method of construction for the elevated guideway and can typically be built without false work between the columns. Some short-term partial or full street closures may be required to accommodate placing girders and other construction activities. The use of falsework will be most likely to occur at the S 336th Street crossing of the guideway for this project.

1.3.2.2 At-Grade Guideway

At-grade light rail is most appropriate for long, relatively flat sections where exclusive right-of-way is available. This project will have an at-grade profile for short sections in Belmor Mobile Home Park extending to just north of S 336th Street within the Washington State Department of Transportation (WSDOT) right-of-way. Typical at-grade profiles for this project include a triple track profile that includes mainline track in both the north and south direction with an adjacent test track, and a double track profile that includes mainline track in both the north and south directions with an adjacent independent at-grade test track that is separated from mainline track. Appendix C provides examples of cross sections of the at grade guideway.

Construction methods and impacts for at-grade guideways will be similar to typical road construction. Existing structures in the project footprint will be demolished, and conflicting utilities will be relocated before construction begins. Shallow, near-surface excavations will be required to construct the subgrade, track, and station platform slabs for at-grade segments. In areas where access is not available from existing roads, a temporary construction road will be built. During the grading phase, the contractors will install culverts or other permanent drainage structures and below-grade light rail infrastructure.

1.3.2.3 Retained Cut/Fill Guideway

With the retained-cut profile, the guideway will be cut into the ground with a retaining wall on one or both sides. Portions of the guideway and test track will include retained-cut profiles due to topography. Where the guideway and test track will transition between at-grade and elevated, or due to topography, there will often be retained fill sections. Retained fill sections will be slightly higher than ground level, and they will be supported by retaining walls (Appendix C).

Construction of retained-cut and retained fill guideway sections will be similar to construction of the at-grade guideway, but they may be more intensive and of longer duration due to the need to construct retaining walls. Retained-cut or retained fill sections will be needed in areas where creating a level surface for the track ballast will be necessary. Such sections could include retaining walls, where necessary. Construction of cuts and fills may include demolition of existing structures, clearing and grading, excavation, utility relocation, construction of temporary access roads between 15 and 30 feet wide, and temporary traffic detours and lane closures. Depending on the depth of the cut and groundwater conditions, dewatering may be necessary during construction.

Fill material for retained fill construction will be delivered to the site by truck. Retained fill structures may require ground improvement, depending on the ability of existing soils to support the increased loads. Reconstruction of streets, sidewalks, and other existing facilities may also be necessary, depending on the final alignment and profile of the retained fill.

1.3.3 Other Facilities and Structures

Equipment buildings used for operation of light rail will be required along the alignment. The buildings are generally beneath the guideway, but they can be separate from the facility. This includes buildings for TPSSs that boost power to the overhead catenary system and signal bungalows that house signal systems. In addition, a test track support building and associated employee parking will be constructed at the north terminus of the test track.

General maintenance roads will sometimes be needed to allow for maintenance of other elements of the project (such as elevated guideway and retaining walls). A small number of parking spaces could also be associated with signal bungalows for service vehicles.

1.3.4 Transportation Improvements/Modifications

The following sections describe transportation improvements necessary to accommodate the OMF South site and associated guideway. These improvements include roadway extensions, road frontage improvements, new guideway access roads, and culvert removal/replacement/modifications.

1.3.4.1 Light Rail and Test Track Access Roadways

Permanent roadway will be constructed to provide access to both the test track and the mainline guideway extending from Winged Foot Way at the north end of the project to its connection point with 24th Avenue S. The roadway is anticipated to be approximately 30 feet wide. Two short access roads will also be constructed off the access roadway just before the connection point with 24th Avenue S. These roadways will allow access to a proposed TPSS south of the access roadway and a stormwater facility north of the access roadway. These access roads will be approximately 16 feet wide. Intersection improvements will be necessary at the access roadways intersection with Winged Foot Way and 24th Avenue S.

1.3.4.2 18th Place S Extension

The proposed project will require the permanent closure of 20th Avenue S from S 336th Street to S 341st Place. A new north-south road connection is required by city code as part of the vacation of 20th Avenue S. The 18th Place S extension will provide an additional connection to S 341st Place on the west side of the proposed OMF South site, and it will also provide access to proposed entry points to the new facility from S 341st Street. The current northern terminus of 18th Place S is S 340th Street. The proposed 18th Place S extension will terminate at S 336th Street. Intersection improvements will be required at both S 336th Street and S 340th Street. The proposed extension will include two 12-foot-wide travel lanes, 3-foot-wide utility corridors on either side of the roadway, a 12-foot-wide multi-use trail, and planter strips on both sides of the roadway, varying from 4 to 6.5 feet wide. The overall roadway will be 52.5 feet wide.

1.3.4.3 21st Avenue S Extension

Because of other modifications to the existing street network as part of the proposed action, 21st Avenue S will also be extended south from S 341st Place to S 344th Street to satisfy city code requirements. The proposed roadway will include two 12-foot-wide travel lanes, a six-foot wide sidewalk, 4-foot-wide planter strips on either side of the roadway, and 3-foot-wide utility strips on either side of the roadway for an overall roadway width of 44 feet.

1.3.4.4 Roadway and Roadway Frontage Improvements

Because of modifications to the local roadway system, improvements will be made to several roadways, including full roadway improvements along 24th Avenue S between S 330th Street and S 333rd Street. This may include minor roadway widening, addition of planter strips, streetside parking, and sidewalks. Half-street improvements are proposed along Oakland Hills Boulevard, S 336th Street, S 341st Street, and S 344th Street.

1.3.5 Culvert Removal/Replacements

The OMF South project will require the removal and replacement of up to three culverts, as well as the complete removal and daylighting of one culvert. Table 1-2, below, summarizes work activities that involve culvert removals or replacements, and more detail on individual culvert replacement is provided in Sections 1.3.5.1 through 1.3.5.4). Figure 1-4 and Figure 1-5 identify where each culvert removal, replacement, or modification will occur.

One culvert identified in the table may be associated with a roadway (WDFW ID #: 935271), and conveys East Fork Hylebos Creek around an existing WSDOT stormwater facility located just north of S 344th Street. This culvert was initially planned to be removed as part of WSDOT's Triangle Project because it was on the list of culverts to be replaced under a 2013 federal court injunction requiring the removal of state-owned culverts in western Washington. However, because WSDOT's project will not be constructed until after the OMF South project has been initiated, this culvert removal is being included as part of the proposed Sound Transit project.

Table 1-2 Culvert Removal/Replacement Summary

Culvert Location	Stream Affected	WDFW ID#	Fish Passage Barrier Status	Action
S 336th Street	East Fork Hylebos Creek Tributary 0016A	935274	Partial Barrier	Remove/Replace – Potential Mitigation Action
S 336th Street	West Fork Hylebos Creek Tributary 0016A	933224	Partial Barrier	Remove/Replace
S 344th Street	East Fork Hylebos Creek Tributary 0016A	935060	Passable	Remove/Replace
Between S 336th and S 344th Streets	East Fork Hylebos Creek Tributary 0016A	935271	Partial Barrier	Remove/Daylight Channel

Source: WDFW 2023a, WDFW 2020a, WDFW 2015, WDFW 2020b, WDFW 2020c

The replacement crossing structures will be sized and configured to prevent them from becoming barriers in the future. The structures will be designed using the design criteria from the Washington Department of Fish and Wildlife's (WDFW's) 2013 Water Crossing Design Guidelines (Barnard et al. 2013). The design of the structures will be determined through hydraulic, geotechnical, and structural engineering evaluations. Appendix D contains preliminary design information for the proposed replacement culverts.

According to the WDFW Habitat Survey Summary Report for the lowermost fish passage barrier (WDFW ID: 935271), removal of all three barriers on the East Fork Hylebos Creek with fish passable structures may improve access to approximately 2.5 linear miles of stream habitat (WDFW 2020c). Barriers located both upstream and downstream currently obstruct fish from accessing the proposed habitat gains; however, WSDOT plans to correct many of these barriers along the I-5 corridor both upstream and downstream of the project footprint in the future. A summary of fish barriers downstream of the site is provided in Section 2 and Figure 1-9 illustrates the overall breadth of fish passage concerns in the Hylebos Creek drainage basin.

The WDFW Level A Culvert Assessment Report for WDFW Site ID 933224 (WDFW 2015) on West Fork Hylebos Creek Tributary 0014C does not document potential upstream habitat gain as WDFW has not surveyed this stream reach; however, removal of this barrier has the potential to facilitate access to approximately 3,800 linear feet of stream channel. Similar to the East Fork Hylebos Creek Tributary 0016A, access to this habitat will be possible only after multiple downstream and upstream barriers to fish passage are removed.

DRAFT: For internal discussion only. Not reviewed or approved on behalf of any party.

1.3.5.1 South 336th Street Culvert Replacement - East Fork Hylebos Creek Tributary 0016A

The proposed action will include replacing the existing S 336th Street culvert crossing of East Fork Hylebos Creek Tributary 0016A. Although the current design does not affect this culvert, Sound Transit anticipates that the replacement of this culvert may be required as mitigation for the project. The existing crossing includes two culverts, a round, 27-inch-diameter, 65-foot-long precast concrete culvert, and a round, 18-inch-diameter, 65-foot-long precast concrete culvert. The existing crossing has been identified as a partial fish passage barrier due to inadequate depth through the culverts (WDFW 2023a). Sound Transit will replace the existing culverts with a 19-foot-wide, 53-foot-long structure that will meet current fish passage design standards. Limited in-stream grading will be required upstream and downstream of the crossing to tie into existing grades.

1.3.5.2 South 336th Street Culvert Replacement – West Fork Hylebos Creek Tributary 0014C

The proposed action will include replacing the existing S 336th Street crossing of West Fork Hylebos Creek Tributary 0014C. This culvert replacement is required due to the widening of South 336th Street and frontage improvements required by the city. The existing crossing includes two culverts, a round, 42-inch-diameter, 86-foot-long precast concrete culvert and a round, 42-inch-diameter, 92-foot-long precast concrete culvert. The existing crossing has been identified as partial fish passage barriers due to excessive slope through (WDFW 2023a). Sound Transit will replace the existing crossing with a 19-foot-wide, 89-foot-long structure that will meet current design standards for fish passage. Limited in-stream grading will be required upstream and downstream of the crossing to tie into existing grades.

1.3.5.3 South 344th Street Culvert Replacement - East Fork Hylebos Creek Tributary 0016A

The proposed action will include replacing the existing S 344th Street culvert crossing of East Fork Hylebos Creek Tributary 0016A. This culvert replacement is required due to culvert relocation as part of the extension of 21st Avenue S to South 344th Street. The existing crossing is a 4-foot-diameter, 315-foot-long corrugated steel culvert. The existing crossing is considered fish passable (WDFW 2023a). Sound Transit will replace the existing crossing with a 32-foot-wide, 382-foot-long structure that will meet current design standards for fish passage. Limited in-stream grading will be required upstream and downstream of the crossing to tie into existing grades.

1.3.5.4 East Fork Hylebos Creek Tributary 0016A Modifications and Daylighting

There are several locations where guideway supports for the mainline and lead tracks overlap with the existing channel location of East Fork Hylebos Creek Tributary 0016A. To avoid these areas of conflict, approximately 1,800 linear feet of channel will be relocated from just upstream of S 336th Street to the inlet for the existing culvert (WDFW Site ID 935271).

The proposed action will also include the removal of the existing culvert (WDFW Site ID 935721). Instead of replacing this culvert, the proposed action will include the creation of (daylighting of) approximately 600 linear feet of stream channel that will tie into the channel relocation discussed above and grading for the new culvert being proposed for the S 344th Street crossing.

Overall, there will be approximately 2,400 lineal feet of channel relocation and associated grading between S 336th Street and S 344th Street. Appendix D contains preliminary design drawings associated with channel relocation and stream daylighting.

1.3.6 Culvert Modifications

1.3.6.1 South 330th and South 333rd Street Culvert Modifications - East Fork Hylebos Creek Tributary 0016A

The proposed action will require the installation of a manhole within the existing roadway prism at both stream crossings identified. The project will require a stormwater connection to the existing culverts at these locations through the manhole, which will serve as both treated construction stormwater discharge points and permanent treated stormwater discharge points. Table 1-3,

Table 1-3 Culvert Modification Summary

Culvert Location	Stream Affected	WDFW ID#	Fish Passage Barrier Status	Action
S 330th Street	East Fork Hylebos Creek Tributary 0016A	935276	Partial Barrier	Install Manhole Cover and Stormwater Piping
S 333rd Street	East Fork Hylebos Creek Tributary 0016A	935275	Partial Barrier	Install Manhole Cover and Stormwater Piping

Source: WDFW 2023a, WDFW 2020d, WDFW 2020e

1.3.7 Mitigation

Although Sound Transit is working to avoid and minimize impacts during design, the construction and operation of the OMF South project will result in unavoidable impacts to wetlands, streams, and their buffers. Pursuant to federal, state, and local regulations, mitigation will be required to compensate for these impacts. At this time, selection of appropriate mitigation and potential mitigation sites is still under development but is likely to include a combination of on-site restoration/mitigation, off-site mitigation (but still within the Hylebos Creek watershed), and use of mitigation banks/in lieu fee programs to purchase credits. Off-site mitigation areas will be designed to compensate for permanent project impacts to wetlands and buffers and could include wetland creation, rehabilitation, and/or enhancement.

1.3.8 General Construction Activities and Equipment

The construction methods discussed above are based on the current preliminary level of engineering design. Specific construction methods will vary depending on site conditions and final design of the structures proposed. Typical construction activities will include the following:

- Demolition (buildings, pavement)
- Clearing and vegetation removal
- Temporary stream diversion (including temporary piping)
- Fill and excavation

- Installation of drainage systems, electrical systems, and communication systems
- Elevated structure construction
- At-grade track construction
- Retained cut construction
- Cut-and-cover trench construction
- Roadway construction and landscaping
- Utility relocation
- Retaining wall construction
- Pile-driving or augering piles
- Deep shaft drilling
- Truck hauling and delivery of materials and equipment
- Dewatering
- Culvert replacements to fish passable structures
- Use of concrete batch plant
- Remediating any unexpected hazardous material areas
- Planting and revegetation

Typical construction equipment used to complete the project includes:

- Trucks (e.g., haul, service, delivery, and tractor trailers)
- Cranes
- Backhoes, loaders, compactors, and excavators
- Grading and paving equipment
- Vibratory equipment
- Drilling rigs and pile-driving equipment
- Forklifts and manlifts
- Jackhammers
- Pumps (e.g., concrete, dewatering)
- Compressors, generators, and welding equipment
- Demolition equipment

1.3.9 Stormwater Management

The OMF South project will largely be a redevelopment of existing developed areas through conversion of areas currently occupied by residential and commercial development to the proposed use. In general, pollution generating impervious surfaces under existing and proposed conditions include local roadways, buildings, and parking areas. Because local roadways and parking lots are subject to substantially lower traffic volumes than any of the adjacent high-volume roadways (SR-99 and I-5), the contribution of contaminants from these surfaces is anticipated to be of less concern than those of highly traveled roadways.

Sound Transit applied the Western Washington Hydrology Model, Version 3.0, to analyze project hydrology and to determine sizing of the stormwater facilities. The conceptual design for stormwater facilities provides best management practices (BMPs) for all new post-project impervious surfaces. New impervious areas resulting from OMF South will include buildings, parking areas, roads, and sidewalks.

Currently, light rail guideways are considered to be non-pollution-generating impervious surfaces[1]. The preliminary design will include stormwater treatment facilities large enough to accommodate treatment for all post-project impervious surfaces. Proposed facilities will include detention ponds, detention vaults, and guideway dispersion. Water quality will be treated to enhanced treatment standards (intended to provide a higher rate of removal of dissolved metals than basic treatment).

Detention facilities have been designed to achieve post-project stormwater flows equivalent to forested conditions, as required by Ecology.

Most treated and retained stormwater is expected to be discharged to existing city drainage facilities that discharge to water bodies from existing municipal separate storm sewer discharge locations. New discharge locations will be added where existing connections do not exist. There will be new outfalls to the East Fork Hylebos Creek Tributary 0016A and the West Fork Hylebos Creek Tributary 0014C.

A project-specific Stormwater Pollution Prevention Plan (SWPPP) and a Temporary Erosion and Sediment Control (TESC) Plan will be prepared and implemented before beginning earthwork. The sediment and flow-control best management practices (BMPs) described in the TESC and SWPPP will minimize the potential for water quality impacts to wetland and stream resources in the project area.

1.3.9.1 Impervious Surfaces

Existing impervious area includes roadways, sidewalks, buildings, and parking lots. Currently, there are large surface parking areas (approximately 11 acres) surrounding the proposed OMF South facility site.

New impervious areas resulting from OMF South will include guideways, buildings, parking areas, roads, ballasted track areas, and sidewalks. To support the design of new or modified stormwater facilities, stormwater engineers delineated 24 threshold discharge areas (TDAs) in the action area, based on downstream flow paths. Table 1-4 summarizes the current and anticipated post-construction acreage of impervious areas' PGISs and areas of runoff to stormwater management facilities in each TDA. Figure 1-10 and Figure 1-11 identify where each TDA is relative to the mainline track and the OMF South Site.

---

[1] Sound Transit and the Washington State Department of Ecology (Ecology) entered into a Memorandum of Understanding dated December 9, 2019, in which Sound Transit agreed to conduct a study to characterize the quality of the stormwater discharged from light rail guideways. The data and analysis from the study will be used to inform the design of light rail projects that are scheduled in the Sound Transit 3 Plan to be completed between 2030 and 2041, and Sound Transit will identify all known, available, and reasonable methods of prevention, control, and treatment to define best management practices specific to light rail.

FIGURE 1-11
Project Elements and TDAs: Mainline
Biological Assessment

OMF South

DRAFT: For internal discussion only. Not reviewed or approved on behalf of any party.

New and relocated roads to accommodate OMF South were counted as project-associated impervious areas because the new and replaced pavement will require stormwater treatment and detention. In areas where elevated guideways will be built over roadways, the underlying impervious area of the road was not included in the impervious area numbers to avoid double-counting. For this analysis, ballasted track sections were counted as impervious areas, although they do not typically express direct stormwater runoff. The project will increase the amount of impervious surface in the action area by 22.3 acres (approximately 67 percent), mostly as a result of the new guideway covering existing forested and grassy right-of-way areas and conversion of grassy areas to impervious surface at the OMF South site. This will include a 16.36-acre increase in impervious surface area in the East Fork Hylebos Creek Tributary 0016A drainage basin and a 6.97-acre increase in impervious area in the West Fork Hylebos Creek Tributary 0014C drainage basin.

1.3.9.2 Pollution Generating Impervious Surface Area

Existing PGISs include roadways, buildings, and parking lots covering 24.20 acres. The proposed action will largely be redeveloping the area, and project-related PGISs will include 25.47 acres that will be redeveloped primarily for new roadway extensions, access roads, frontage road improvements, and surface parking areas. Overall, there will be a 1.27-acre increase in PGIS within the project action area. This will include a 1.53 acre increase in PGIS in the East Fork Hylebos Creek Tributary 0016A drainage basin and a 0.26-acre reduction in PGIS in the West Fork Hylebos Creek Tributary 0014C drainage basin. Table 1-5 identifies all existing and proposed PGIS, changes in impervious surface area, what types of treatment will be provided, and where in each drainage basin the stormwater will ultimately be discharged (Figure 1-12 and Figure 1-13).

1.3.9.3 Stormwater Flow Control and Treatment

The OMF South project will comply with the following local design manuals:

- City of Federal Way: King County Surface Water Design Manual (King County 2021) and the City of Federal Way Addendum to the King County Surface Water Design Manual (Federal Way 2017)

Stormwater management (SWM) facilities have been designed to provide enhanced treatment. Enhanced treatment facilities for the project will include CSTW/DPs and vaults with pre-settling basins and sand filters. The type of facility varies depending on location and ownership. CSTW/DP facilities are public-domain, non-proprietary SWM facilities. Vaults with pre-settling basins and sand filters are also public-domain, non-proprietary SWM facilities that meet the requirements of the King County Surface Water Design Manual (King County 2021). SWM facilities that discharge to East Fork Hylebos Creek Tributary 0016A, West Fork Hylebos Creek Tributary 0014C, and associated wetlands have been designed to provide enhanced treatment using a CSTW/DP, plus a large sand filter downslope or vaults with pre-settling basins and sand filters. This approach meets the requirements of the 2021 King County Surface Water Design Manual. These proposed types of best management plans (BMPs) have also been considered to have “medium” potential to reduce loading of 6PPD and 6PPD-quinone into surface water (Ecology 2022). As design proceeds, alternative treatment BMPs (public-domain or proprietary) may be implemented to reduce facility footprints and/or address maintenance concerns of the owning agencies. Stormwater BMPs will implement technologies that have been shown to achieve Ecology’s performance goals for enhanced treatment. All runoff is considered to be PGIS, except for runoff from light-rail-only impervious surface (such as at grade or elevated guideways), sidewalks, and roofs, which is consistent with the design manuals mentioned above. All PGIS will receive on-site water quality and flow control treatment before being discharged into separate municipal storm sewer systems.

Where practical, non-PGIS runoff will be conveyed separately from PGIS runoff because it will not require water quality treatment. Non-PGIS runoff from elevated guideways will be dispersed over established forested areas or installed permanent vegetation where infiltration could occur. In areas that require installation of permanent vegetation the underlying soils will meet the criteria of post-construction soil quality and depth and topped with jute matting. This will help to reduce the volume of runoff to be detained, thereby reducing the size of the detention facilities. Dispersion will be practical in areas where permeable surfaces exist below the guideway, and there will be little human activity (because water dripping from the guideway above will be bothersome to people below). Where non-PGIS and PGIS runoff will be conveyed jointly, the stormwater management facility will be designed to detain the joint flow and to provide required treatment for the PGIS flow in accord with Ecology standards.

The following provides a brief overview of the receiving waterbodies, contributing TDAs, and existing and proposed conveyance networks.

East Fork Hylebos Creek Tributary 0016A

Sixteen TDAs are in the East Fork Hylebos Creek Tributary 0016A watershed within the action area (Tables 1-3 and 1-4; Figures 1-10 and 1-11). Overall, there will be a 1.53 acre increase in PGIS within contributing area above baseline conditions. The proposed action will provide enhanced treatment for all new and existing PGIS (14.93 acres) within the contributing basin of East Fork Hylebos Creek Tributary 0016A. Most of the treatment BMPs consist of vaults with pre-settling basins and an additional sand filter. From treatment facilities, treated stormwater either enters existing stormwater conveyance facilities or new conveyance facilities that ultimately drain/discharge to East Fork Hylebos Creek Tributary 0016A at eight locations along the alignment (Figures 1-12 and 1-13). In general, the discharge locations will be made at existing culvert/road crossings via existing conveyance facilities, new culvert tie in locations (e.g., S 330th and South 333rd Street), or new outfalls with dispersion and overland flow to the stream. New outfalls will be stabilized to prevent scour/erosion at the outlet.

East Fork Hylebos Creek Tributary 0016A

Eight TDAs are in the West Fork Hylebos Creek Tributary 0014C watershed within the project action area (Tables 1-3 and 1-4; Figures 1-10 and 1-11). Overall, there will be a 0.26 acre decrease in PGIS within contributing area above baseline conditions. The proposed action will provide enhanced treatment for all new and existing PGIS (10.54 acres) within the contributing basin of West Fork Hylebos Creek Tributary 0014C. Stormwater treatment BMPs consist of vaults with pre-settling basins with an additional sand filter and a combined stormwater wetland detention facility. From the treatment facilities, stormwater is either conveyed via existing or new stormwater conveyance facilities to discharge in West Fork Hylebos Creek at 336th Street or will tie into the existing flow control structure at the outlet of the regional stormwater treatment/detention facility positioned between S 336th Street and SR-99. Note that those stormwater facilities that discharge at S 336th Street will receive additional water quality/quantity treatment (polishing) within the regional stormwater detention/treatment facility.

1.3.10 Construction Schedule

Mobilization is anticipated to begin in late April 2025 with construction not beginning until November 2025. Construction is anticipated to be completed by June 2032. ST is pursuing measures to advance the opening earlier (potentially 2030). Work may occur along any section of the alignment over the 43-month project duration. Typical construction will occur on a 5- to 6-day workweek schedule and will occur primarily between the hours of 7 a.m. and 10 p.m. In some locations (such as when street detours are involved and/or daytime construction periods have to be abbreviated to reduce impacts), additional shifts, all week, nighttime, or 24-hour construction activities could be necessary.

1.3.11 Interrelated and Interdependent Activities

An interrelated activity is part of the proposed action, and it depends on the proposed action for its justification (50 CFR 402.02). An interdependent activity has no independent utility apart from the action under consultation. The OMF South is a stand-alone project. It is justified by the separate components of the Sound Transit regional transit plan; however, these components are not contingent on the OMF South, and these individual components have been and/or would be subject to separate Section 7 consultation. Interrelated and interdependent activities associated with the OMF South project will include traffic detours and mitigation for impacts to sensitive areas.

When work occurs adjacent to or over a roadway, closure of lanes or the full roadway may be needed. Where construction will partially or fully close streets, through traffic will be detoured while maintaining access to existing businesses and residences. Road closures and detours will require approval by the local jurisdiction, as well as coordination with local residents and businesses. A maintenance of traffic plan will be prepared to address road closures, detours, access, and other traffic modifications needed for construction activities. Traffic modifications during construction will be unlikely to result in effects on listed species based on species' use of the action area and the general lack of suitable habitat (see Section 2).

Activities associated with compensatory mitigation for impacts to streams, wetlands, and wetland buffers can be considered interrelated and interdependent actions for this project. Mitigation for such impacts is still under development. Any potential impacts will be mitigated first by avoiding and minimizing impacts through design and by rectifying temporary impacts and, finally, by providing compensatory mitigation for unavoidable permanent impacts in compliance with applicable federal, state, and local requirements. Compensatory mitigation will be required and may include options such as on-site restoration, enhancement, use of mitigation banks or fee-in-lieu programs, and identification of a suitable site for in-kind mitigation nearby.

1.4 Performance Standards and Impact Avoidance, Minimization, and Mitigation Measures

To avoid and/or minimize potential impacts from construction and operation of the OMF South project, Sound Transit contracts will require implementing the conservation measures presented below.

1.4.1 Water Quality Protection During Construction

- The construction contractor will develop and implement a temporary erosion and sediment control (TESC) plan for all aspects of project construction requiring clearing, vegetation removal, grading, ditching, filling, embankment compaction, demolition, and/or excavation. BMPs defined in the plan will be used to control sediments from all vegetation removal or ground-disturbing activities.
- The construction contractor will develop a spill prevention control and countermeasures (SPCC) plan before beginning construction. The SPCC plan will identify the appropriate spill containment measures that will be used throughout project construction.
- The construction contractor will adhere to water quality standards as stated in the 401 Water Quality Certificate and National Pollution Discharge Elimination System (NPDES) permit issued for the project as applicable.
- BMPs included in the TESC and SPCC plans and NPDES permit conditions will include, but will not be limited to, the following:
  - Erosion control devices (e.g., silt fences) will be installed, as needed, to protect surface waters and other critical areas.
  - Erosion control blankets, or an equally effective BMP will be installed, as needed, on steep slopes that are susceptible to erosion and where ground-disturbing activities have occurred. This will prevent erosion and will assist with establishment of native vegetation.
  - Material that may be temporarily stored for use in project activities will be covered with plastic or other impervious material during rain events to prevent sediments from being washed from the storage area to surface waters.
  - All temporary and permanent erosion and sedimentation control measures will be inspected on a regular basis, maintained, and repaired to ensure continued performance of their intended function.
  - Silt fences will be inspected after each rainfall and at least daily during prolonged rainfall.

  - Turbid water will be prevented from discharging to streams and wetlands. Turbid wastewater may be routed to temporary or permanent detention facilities, or to upland areas that will provide adequate infiltration.
  - All equipment to be used for construction activities will be cleaned and inspected before arriving at the project site to ensure that no potentially hazardous materials are exposed, no leaks are present, and the equipment is functioning properly.
  - Construction equipment and vehicles will be maintained to prevent them from leaking fuel or lubricants.
  - Uncured concrete and/or concrete byproducts will be prevented from coming in contact with streams or water conveyed directly to streams during construction.
  - A concrete truck chute cleanout area or equally effective BMP will be established to properly contain wet concrete.

1.4.2 General Best Management Practices for Construction Near Sensitive Areas

- Sound Transit will ensure compliance with all local, state, and federal permits received for the project.
- The construction contractor will delineate the boundaries of ground disturbance to prevent unintended effects on riparian vegetation, wetlands, woodlands, and other sensitive sites, both inside and outside of the construction limits. The construction limits will be clearly marked with high-visibility construction fencing before any ground-disturbing or construction-related activities, and no work in sensitive areas will occur outside of the construction limits.
- The construction contractor will implement measures to prevent erosion from soil or rock stockpiles, excavated materials, and excess soil materials into sensitive habitats, including water channels, wetlands, and riparian areas outside of the construction limits as a result of stormwater runoff.

1.4.3 Mitigation for Impacts to Sensitive Areas

- Sound Transit is coordinating with resource agencies local jurisdictions and Tribes to identify compensatory mitigation sites for stream, wetland, and wetland/stream buffer impacts in association with the construction and operation of the OMF South. The mitigation will be approved by the appropriate permitting agencies and jurisdictions prior to construction. Wetlands and buffers that are temporarily disturbed during construction will be restored and replanted on site. The compensatory mitigation plan will include a combination of purchasing credits from the King County In-lieu Fee Program or approved mitigation bank, plus development of a mitigation area within the Hylebos Creek basin downstream of the project.

1.4.4 Design and Operational Best Management Practices

- The proposed action will include permanent stormwater runoff treatment and flow control facilities, meeting the requirements of the current King County Surface Water Design Manual (King County 2021).
- Sound Transit will incorporate stormwater conveyance and management facilities that promote infiltration in the facility design where practicable and permittable.

- Sound Transit will use runoff treatment BMPs that are best suited to the site conditions and best able to achieve the required levels of treatment. These may include natural or engineered dispersion BMPs; biofiltration BMPs such as vegetated filter strips, rain gardens, biofiltration swales, or media filters; wet-pool BMPs; and infiltration BMPs.
- Existing drainage configurations will not be rerouted to the extent that stormwater from one subbasin is conveyed and discharged to another.
- Sound Transit will use the following design and operational measures to prevent pollution resulting from mechanical lubricants used in the LRVs:
  - Sealed housing roller bearings for all axle bearings
  - Enclosed and sealed motor bearings
  - Enclosed truck bearings designed to exclude dirt
  - Sealed door mechanisms
  - Enclosed, sealed electrical conduits
  - On-board batteries contained within sealed enclosures
  - Air conditioners with refrigerant enclosed in sealed system and motors with sealed bearings

1.4.5 Regulatory Controls

- The project will be constructed in accord with regulatory permits, including the Hydraulic Project Approval issued by WDFW.
- In-water work will occur only during the authorized in-water work window, as determined by agencies with regulatory authority. The only streams in which in-water work will occur are the East Fork Hylebos Creek Tributary 0016A and the West Fork Hylebos Creek Tributary 0014C. Both tributaries flow intermittently, and they are typically dry during summer and early autumn (see Section 3.2.2). The tributaries flow to Hylebos Creek, which discharges to Commencement Bay. Neither WDFW nor the Corps specifies a standard window for work within tributaries to Commencement Bay. The in-water work window for the HPA WDFW issued for 2023 geotechnical borings on the preferred alternative was July 15 through September 30.
- Project construction will be performed in compliance with Washington State water quality rules (Washington Administrative Code [WAC] 173 201A 200), including requirements for work stoppage if turbidity levels or other relevant parameters exceed allowable levels outside the mixing zone.
- Before work below the ordinary high water line (OHWL) of any stream begins, the work site will be isolated from upstream and downstream waters to facilitate working in a dry channel and minimizing turbidity and erosion potential. If any fish are present within the work area, they will be relocated. While listed fish are not expected to be present within the project area, other resident species may be considered sensitive by the state or constitute the prey base for salmonids downstream.
- If water is present in stream channels where ground-disturbing work occurs, fish exclusion will follow the guidance outlined within the Recommended Fish Exclusion, Capture, Handling, and Electroshocking Protocols and Standards document (USFWS 2012) and WSDOT’s Fish Exclusion Protocols and Standards document (WSDOT 2023a).

- Flow will be gradually introduced to the new channel to minimize sediment delivery in downstream reaches.
- Areas disturbed during construction will be restored with suitable vegetation, consistent with approved revegetation plans and critical area reports. Critical areas and riparian zones will be restored with native woody species adapted to those conditions.
- Unavoidable impacts on wetlands and streams and associated buffers will be mitigated by using guidance in Federal Way City Code (FWCC) 19.145.430. Ongoing restoration projects in the Hylebos watershed, the King County in-lieu fee program, and the development of a project-specific mitigation site are possible opportunities for mitigation that will comply with all federal, state, and local requirements.

1.5 Project Action Area

The project action area is defined as “all areas to be affected directly or indirectly by the Federal action and not merely the immediate area involved in the action” (50 Code of Federal Regulations [CFR] 402.02). The action area encompasses all areas where the project will have physical, biological, and chemical effects on the environment. This includes all areas within the project construction footprint, all areas influenced by the direct effects or delayed consequences of project construction and operation, and all areas affected by interrelated or interdependent actions.

The project action area consists of two components: terrestrial and aquatic. The extents of these two components of the action area are described in Sections 1.5.1 and 1.5.2, respectively, and they are illustrated in Figure 1-14**,** Figure 1-15, and Figure 1-16.

In this document, the term “project action area” (or “action area”) has a specific meaning, as defined above. The term “project site” encompasses the limits of construction, and it is also referred to as the project footprint. The project area is a more general term for the vicinity of the project site.

1.5.1 Terrestrial Component of the Action Area

The terrestrial component of the action area includes the project footprint and terrestrial areas where construction noise will be audible. These areas are described below.

Project footprint: The approximate construction footprint includes areas for road improvement, new roadways and guideways, intersections, culvert replacements for fish passage barrier removal, and stormwater facilities. These activities are primarily bounded by I-5 to the east, SR-99 to the west, S 320th Street to the north, and S 344th Street to the west. Additional wetland off-site mitigation may be required for the project, but the mitigation strategy has not yet been identified. If mitigation for project-related impacts may result in impacts on ESA-listed species and habitats not considered in this analysis, those impacts will be addressed through future consultation.

Noise: The distance at which airborne construction noise will be audible is based on the distance at which construction noise will attenuate to background levels. For this project, there are two different background noise levels. Noise levels in the project area and west of I-5 were measured over a 24-hour period at two locations, one adjacent to the proposed guideway at the north end of the project and another close to the location for the proposed OMF South Site. Both sites resulted in an average background noise level of 70 dBA (a-weighted decibels). Noise levels to the east of the project area are better characterized by the traffic noise associated with I-5. I-5 in the project area has a posted speed limit of 60 miles per hour (mph) with an average annual daily traffic (AADT) volume of 174,000 vehicles (WSDOT 2023b). To convert AADT to an hourly traffic volume, WSDOT recommends taking 10 percent of the AADT, which in this case is roughly equivalent to 17,400 vehicles per hour (v/h) (WSDOT 2023c). A roadway with an hourly traffic volume of 6,000 vehicles per hour and a posted speed limit of 60 mph has an associated noise level of 79.8 dBA. For traffic volumes exceeding 6,000 per hour, add 1 dB for every 1,000 v/h increase at a particular speed. Applying this to our traffic volume of 17,400 vehicles per hour, we would add 11.4 dBA to the 79.8 dBA for a noise level of approximately 91 dBA (WSDOT 2023b).

WSDOT's terrestrial noise calculator was used to determine the extent of construction related noise. Data input included the background noise levels identified above and the three loudest pieces of equipment anticipated to be used during construction, including a jackhammer (95 dBA), an impact hammer (105 dBA), and a vibratory hammer (105 dBA).

Based on this information, the terrestrial zone of effect related to noise is anticipated to extend 1,600 feet from the project footprint on the west side of I-5 in all directions except to the east. Because the noisy I-5 corridor is immediately east of the project footprint, construction-related noise is expected to attenuate to background within 241 feet from the east edge of the project footprint Figure 1-14.

1.5.2 Aquatic Component of the Action Area

The aquatic portion of the action area includes watercourses that will be affected by the following:

- Construction-related impacts during culvert removal and replacement, stream daylighting, and channel realignment activities
- Changes in the amount of PGIS
- Future expansion of fish-accessible habitat by removal of fish passage barriers

Construction-related impacts: Fish passage culvert replacements and planned stream realignments may result in temporarily elevated turbidity in the East Fork Hylebos Creek Tributary 0016A and West Fork Hylebos Creek due to disturbance of the stream bed and bank. Portions of these streams may be temporarily piped to protect water quality during construction. Work near and within both streams will be performed during the period when stream flows are lowest and when anticipated stream flow is less than 10 cubic feet per second. Stream flow is intermittent in the project area, and the channel is typically dry during summer and early autumn (i.e., during the anticipated in-water work window). Project construction will be performed in compliance with Washington State water quality rules (WAC 173-201A-200). If water is present in the stream at the time of construction, any potential exceedance of the turbidity criteria established in WAC 173 201A 200 will not be expected to extend more than 100 feet downstream and 50 feet upstream of the project footprint. This distance represents the maximum extent of the aquatic portion of the action area as defined by the effects associated with construction-related turbidity.

PGIS-related impacts: New or reconfigured SWM facilities will discharge to the two tributaries: West Fork Hylebos Creek Tributary 0014C and East Fork Hylebos Creek Tributary 0016A. These streams ultimately drain to the mainstem Hylebos Creek, which discharges to the Hylebos Waterway. The Hylebos Waterway is a dredged channel maintained by the Port of Tacoma that connects to Commencement Bay.

Based on habitat conditions, intermittent flows, and the presence of total barriers to fish passage, ESA-listed fish are not expected to be present in any stream reaches within 1.5 miles of the project footprint, including the discharge points of proposed stormwater facilities.

However, emerging research related to urban runoff mortality syndrome indicates that adult and juvenile coho salmon (*Oncorhynchus kisutch*) are particularly vulnerable to lethal and sublethal effects of exposure to 6PPD-quinone, a ubiquitous chemical in tires that is introduced into streams via road runoff (Tian et al. 2021). Additional research has shown that both juvenile steelhead (*Oncorhynchus mykiss*) and juvenile Chinook salmon (*Oncorhynchus tshawytscha*) are also vulnerable to untreated stormwater containing 6PPD-quinone; however, the effects are not as immediate and instead of mortality occurring within a few hours of exposure (up to 4 hours for coho salmon), it can take one or two days for steelhead and Chinook salmon to display mortality (Fresh et al., 2022). A recent study looked at the sensitivity of early life stage (~ three weeks post swim-up [newly feeding] coho salmon and Chinook salmon) and found that juvenile coho salmon are three orders of magnitude more sensitive to 6PPD-quinone than Chinook salmon (Lo et al., 2023). This study found only 7.1% survival for coho salmon exposed to the lowest concentration treatment group, while Chinook salmon showed 61.4% survival in the highest concentration treatment group (Lo et al. 2023). While not showing the degree of sensitivity to stormwater runoff containing 6PPD-quinone as coho salmon, juvenile steelhead and Chinook do appear to exhibit direct mortality, although at higher concentrations and longer response times (Tien et al. 2021, Fresh et al. 2022, Lo et al. 2023, and Brinkman et al 2022). Other contaminants, such as metals and polycyclic aromatic hydrocarbons, are also associated with adverse effects on ESA listed salmonids and their prey. FHWA and WSDOT are closely tracking efforts to gather critical additional information on this topic, such as the fate and transport of 6PPD quinone and other contaminants in the environment, concentration thresholds for acute and sublethal toxicity, potential effects on species other than coho salmon, and the effectiveness of stormwater treatment facilities in reducing the concentration of contaminants in stormwater runoff.

For this analysis, it is assumed that (1) 6PPD quinone and other contaminants in stormwater are toxic to ESA-listed salmonids and potentially toxic to other listed species including bocaccio and yelloweye rockfish, (2) contaminants may be present in toxic concentrations in streams that receive discharges from SWM facilities, and (3) such concentrations may persist as far downstream as the streams’ discharge points to marine waters. As such, the aquatic component of the action area extends downstream to the mouth of Hylebos Creek, where it drains into the Hylebos Waterway in Commencement Bay (Figure 1-14).

Habitat expansion: The action area in East Fork Hylebos Creek Tributary 0016A will extend approximately 2.5 miles upstream and east of I-5 due to the removal of a current partial fish passage barrier (Site ID 935271), located immediately upstream of S 344th Street. The existing 417-foot culvert will be removed, and the stream will be daylighted in this general location. Accessibility to the aquatic habitats will depend on removal of several barriers upstream and downstream of the project area. WSDOT is developing plans for the removal of several barriers to fish passage (two total barriers and four partial barriers) on East Fork Hylebos Creek Tributary 0016A downstream of the project area. It is assumed for this analysis that those barriers will not have been removed before construction begins. Even if those barriers are removed before starting construction, several barriers (including one total barrier) will impede access to the habitat rendered accessible by this project. The total barrier (WDFW Site ID 932945) is on a crossing of S 363rd Place approximately 1.3 miles downstream of S 344th Street.

Similarly, the action area in the West Fork Hylebos Creek Tributary 0014C will extend approximately 0.8 mile upstream of S 336th Street to the stream’s end point in Belmor Park Golf and Country Club due to the removal of the current fish passage barrier beneath S 336th Street (Site ID 933224) and replacement with a fish passable culvert. Accessibility to the aquatic habitats will depend on removal of several barriers upstream and downstream of the project area. Currently there are three complete barriers downstream, one complete barrier upstream, and numerous partial fish passage barriers upstream and downstream of the S. 336th Street crossing (Figure 1-14).

2 STATUS AND PRESENCE OF LISTED SPECIES AND DESIGNATED CRITICAL HABITAT IN THE PROJECT ACTION AREA

The following resources were consulted to develop and refine the list of species that might be affected by construction and operation of the OMF South project:

- The USFWS Information for Planning and Consultation Program (see Appendix E)
- WDFW Priority Habitats and Species data (WDFW 2023b)
- Maps depicting the freshwater range of ESA-listed Pacific salmon and steelhead under the jurisdiction of NMFS (NMFS 2023)
- Statewide Integrated Fish Distribution (SWIFD) Web Map from the Northwest Indian Fisheries Commission (NWIFC 2023)
- USFWS critical habitat online mapper (USFWS 2023)
- Bird species maps and sighting data (eBird 2023)
- Washington Department of Natural Resources (WDNR) Washington Natural Heritage Program data (WDNR 2023a and 2023b)
- City of Federal Way critical areas maps (City of Federal Way 2016)
- Communications with Puyallup Tribe of Indians Fisheries (Ladley, personal Communications 2021a and 2021b)
- Annual salmon, steelhead, and bull trout report: Puyallup/White River Watershed – Water Resource Inventory Area 10 (Marks et. al 2018 and 2021)

2.1 Species and Critical Habitat Lists and Listing Status

The USFWS and NMFS lists of ESA-listed species and critical habitats were accessed on their websites on September 8, 2023 (Appendix E). Based on information provided at those websites and tribal coordination on salmon presence, ESA-listed species that could occur within the action area are identified in Table 2-1. No species proposed for listing are known or expected to currently use habitats in the action area, and no areas proposed for designation as critical habitat are present.

The list provided by USFWS does not identify the gray wolf as an ESA-listed species potentially present in the action area. This may be a product of the rule issued by USFWS on November 3, 2020 (85 Federal Register [FR] 69778), removing gray wolves from the list of species protected under ESA. However, on February 10, 2022, the U.S. District Court for the Northern District of California vacated and remanded USFWS' delisting rule. The court's decision effectively reinstated the listing status the species had before USFWS issued the delisting rule. As a result, gray wolves in western Washington have a listing status of endangered. Gray wolf critical habitat is not present in the action area.

Table 2-1 ESA-Listed Species and Critical Habitats

Species or Critical Habitat[(1)]	Listing Status	Federal Jurisdiction	Critical Habitat in Action Area
Streaked horned lark (*Eremophila alpestris strigata*)	Threatened	USFWS	No
Yellow-billed cuckoo, Western U.S. distinct population segment (DPS) (*Coccyzus americanus*)	Threatened	USFWS	No
Marbled murrelet (*Brachyramphus marmoratus*)	Threatened	USFWS	No
Taylor's checkerspot (*Euphydryas editha taylori*)	Endangered	USFWS	No
Gray wolf (*Canis lupus*)	Endangered	USFWS	No
North American wolverine (*Gulo gulo luscus*)	Threatened	USFWS	No
Bull trout (*Salvelinus confluentus*)	Threatened	USFWS	No*
Chinook salmon, Puget Sound ESU (*Oncorhynchus tshawytscha*)	Threatened	NMFS	Yes
Steelhead, Puget Sound DPS (*Oncorhynchus mykiss*)	Threatened	NMFS	Yes
Bocaccio, Puget Sound/Georgia Basin DPS (*Sebastes paucispinis*)	Endangered	NMFS	No
Yelloweye rockfish Puget Sound/Georgia Basin DPS (*Sebastes ruberrimus*)	Threatened	NMFS	No
Killer whale, Southern Resident DPS (*Orcinus orca*)	Endangered	NMFS	No

Sources: * 75 FR 63898;

Notes:
(1) ESU = evolutionarily significant unit; DPS = distinct population segment

Six of the species identified in Table 2-1 are not expected to occur in the action area for the reasons detailed in the sections below. An additional species, the northwestern pond turtle (*Actinemys marmorata*), was recently proposed for listing as a threatened species; however, due to its restricted distribution, it is not anticipated to occur within the action area. A brief description of the northwestern pond turtle and current distribution is provided below.

Streaked Horned Lark

Streaked horned larks are not expected to use habitats in the action area. This species requires large areas of open grassland habitat with clear sightlines, and it is known to occur in portions of southern Puget Sound, along the Washington Coast, and at lower Columbia River islands (78 FR 61451, October 3, 2013). Breeding habitat for streaked horned larks in Washington consists of grasslands and sparsely vegetated areas at airports, sandy islands, and coastal spits. No such habitat is present in the action area. Grassland habitat is present on the Weyerhaeuser property located immediately east of the proposed action and on the east side of I-5. This grassland habitat is visible in Figure 1-15 and Figure 1-16. The total size of the habitat patch is less than 60 acres; the smallest site with evidence of streaked horned lark use in the Puget Trough region is 90 acres (Anderson and Pearson 2015). In addition, the fields on the Weyerhaeuser property are dominated by densely growing, sod-forming grasses. Streaked horned larks typically select habitat patches with low, sparse vegetation and a relatively high percent cover of bare ground, avoiding areas dominated by shrubs or sod-forming grasses

(Anderson and Pearson 2015). The closest known breeding area is at Tacoma Narrows Airport, more than 10 miles from the action area. The closest location where critical habitat has been designated for the streaked horned lark is more than 80 miles from the action area. For these reasons, the project will have **no effect** on streaked horned larks.

Yellow-billed Cuckoo

Yellow-billed cuckoo nest almost exclusively in low- to mid-elevation riparian woodlands that cover 50 acres or more within arid to semiarid landscapes (Hughes 1999). Most breeding sites have been found in patches larger than 200 acres. Historical records indicate that breeding habitat for yellow-billed cuckoos in Washington consisted primarily of cottonwood and willow bottoms along the lower Columbia River and in the Puget Sound lowlands. The last confirmed breeding records of yellow-billed cuckoos in Washington are from the 1930s. Currently, the species no longer breeds in western Canada and the northwestern continental United States (Washington, Oregon, and Montana) (79 FR 59991, October 3, 2014). No observations of this species have been documented within 10 miles of the action area (WDFW 2023b; eBird 2023). No blocks of suitable forested riparian habitat larger than 5 acres are present in the action area. For these reasons, the project will have **no effect** on yellow-billed cuckoos.

Marbled Murrelet

Marbled murrelets require old-growth forest for nesting and marine habitats for foraging. No suitable nesting or foraging habitat is present within 2 miles of the terrestrial portion of the action area, and there have been no documented observations of nesting marbled murrelets within 10 miles. Occasional observations of marbled murrelets have been documented in Commencement Bay outside of the industrial waterways (eBird 2023); however, given the noise and industrialized nature of these marine foraging areas, marbled murrelet use of these areas is anticipated to be extremely low. No designated critical habitat for marbled murrelets is present within 10 miles of the action area. The potential for marbled murrelet nesting in the action area is minimized by the following:

- All forested areas in the action area have been logged multiple times in the past century and a half; young forests and small patches of conifers lack the complexity preferred by murrelets. Murrelets typically nest in large coniferous trees in areas containing characteristics of older forests (McShane et al. 2004).
- The project site is immediately adjacent to I-5 and the urban landscape of Federal Way, where high levels of noise and activity likely discourage use by nesting marbled murrelets. Raphael et al. (2016) found that nesting habitat correlated strongly with areas of low human disturbance.
- Construction related noise is not anticipated to affect marbled murrelets flying between foraging habitat in Puget Sound and inland nesting sites due to the existing high levels of noise along the I-5 corridor and adjacent urban development.
- The closest sites where potential nesting behavior has been observed are more than 30 miles away.
- Marbled murrelets have been found to demonstrate a fairly high degree of fidelity to forest stands used for nesting (Plissner et al. 2015). If murrelets historically nested near the project site, any nest trees were removed when the area was cleared at the time of initial settlement by Euro-Americans and on multiple occasions thereafter. Descendants of any murrelets that nested near the project site had to find suitable breeding habitat farther inland, on the western slopes of the Cascades. Birds in those lineages are likely to return to the stands that have been used more recently for nesting. Flying through forested areas near the

project site in search of trees with suitable nest platforms would require an excessive expenditure of energy and exposure to predation risk. As such, the probability of any murrelets finding platforms in the project area and selecting them as nest sites is negligible.

For the reasons specified above, the project will have **no effect** on marbled murrelets.

Taylor's Checkerspot

Taylor's checkerspot butterflies require grassland dominated by fescue or other short-stature grass species, with a diversity of larval host plants and spring nectar sources (Stinson 2005). The closest known population is more than 15 miles from the project area. Populations in the Puget Sound region are primarily associated with shallow soil balds and grasses within a forested landscape. In Washington and Oregon, Taylor's checkerspot butterfly larvae feed primarily on native paintbrush and closely related species (e.g., *Castilleja hispida, C. levisecta, Triphysaria spp.*), and on plantain species such as non-native *Plantago lanceolata* and native *Plantago maritima* (61938 FR 77, October 11, 2012). Other annuals documented as larval host foods include several species of speedwell (*Veronica spp.*), blue-eyed Mary (*Collinsia grandiflora* and *C. parviflora*), and sea blush (*Plectritus congesta*). *Plantago lanceolata* and *Plantago maritima* could be present in grassy habitat throughout the project corridor. Other larval host species have not been observed, and they are unlikely to be present. Grosboll (Grosboll 2011) found that, within areas of broadly suitable grassland vegetation structure, Taylor's checkerspot butterfly adults lay their eggs in areas with very high densities of host plants. Of 31 oviposition locations studied, the volume of host plants in all but one exceeded 10,000 cubic centimeters per square meter. No areas with such high densities of paintbrush or plantain species have been observed in the project action area. For the reasons specified above, the project will have **no effect** on Taylor's checkerspot.

Gray Wolf

Gray wolves require areas with abundant prey and low levels of human disturbance. The current range of gray wolves is not known to extend into the Puget lowlands, and there have been no documented den or rendezvous sites within the action area. The closest pack is the Napeequa Pack (nonbreeding pack) over 70 miles away from the action area, followed by the Shady Pass pack (breeding pack) approximately 90 miles away from the action area, and the Teanaway single wolf territory over 60 miles away from the action area (WDFW 2023c). All packs and territories are located on the other side of the Cascade crest. Based on the location of the project area in a lowland urban setting with high levels of human activity and no nearby roadless areas, no suitable habitat for this species is present in the action area. Critical habitat for gray wolves in Washington has not been designated. For the reasons specified above, the project will have **no effect** on the gray wolf.

North American Wolverine

North American wolverines strongly prefer cold areas with a deep snowpack that persists through the spring. Because of this preference, wolverines are typically found at high elevations at the latitude of the project site. Suitable habitat and sufficient prey resources for wolverines do not exist within the action area. For the reasons specified above, the project will have **no effect** on North American wolverine.

Northwestern Pond Turtle

The northwestern pond turtle was proposed for listing as a threatened species in October 2023 (88 FR 68370). No critical habitat has been proposed or designated for the species at this time.

Historical records suggest a limited distribution of northwestern pond turtle in Washington, being restricted to central and southern Puget Sound from Snohomish County to Thurston County, and Skamania and Klickitat counties in the Columbia Gorge (Hays et al. 1999). Currently, the species occurs at six locations in the state, including three sites in Skamania County, and one each in Klickitat, Mason and Pierce counties (Hallock et al. 2017). In Washington, they are found associated with ponds, small lakes and wetlands at elevations below 300 m (985 ft.) (Hays et al. 1999). They also require the availability of adjoining open upland habitats. In Washington, northwestern pond turtles are considered conservation reliant because of the small number of occupied sites, low abundance, non-native predation, and reliance on headstarting to maintain populations (88 FR 68370-68399). Headstarting is the process of removing eggs from the wild and raising through the most vulnerable life stages and then releasing back to the wild.

Currently, the closest population is located approximately 10 miles southwest of the proposed action. Given the distance from the existing population in Pierce County and the project area, the dense road network system between the existing population and the project area, and the developed nature of the project area, the potential for the species to occupy habitats in the project action area is extremely unlikely without human intervention.

2.2 Presence of Federally Listed and Proposed Species in the Project Action Area

Parametrix biologists conducted field investigations in the action area on several occasions between 2019 and 2022. The results of the investigations are summarized below. Before conducting fieldwork, the biologists reviewed maps and materials on the soils, hydrology, topography, land use, floodplains, wetlands, streams, and wildlife habitat in the action area. In addition, information from the WDNR Natural Heritage database indicates that no threatened or endangered plants are known to occur within 5 miles of the project site (WDNR 2023a and 2023b).

Discussions in this subsection describe the known and expected use of habitats in the action area by the species identified in Table 2-1. Based on the presence of downstream barriers to fish passage, combined with intermittent flows and a lack of potentially suitable habitat, ESA-listed fish are not expected to be present in any streams within 1 mile of the project site. The following discussions are intended primarily to support evaluations of the potential for exposure of fish in downstream waters. These species might be exposed to contaminants in stormwater runoff from impervious surfaces created or replaced by project construction. Discussions of species presence and habitat use include those with the potential to occur in the Hylebos Creek watershed (HUC 17110019).

2.2.1 Bull Trout

USFWS listed bull trout as threatened under ESA on November 1, 1999 (64 FR 58910). The Statewide Integrated Fish Distribution (SWIFD) database does not indicate the presence/distribution of bull trout in any streams within the Hylebos Creek drainage basin (NWIFC 2023). According to the SWIFD database, the closest documented presence of bull trout is in the Puyallup River (NWIFC 2023).

Despite the general absence of bull trout-preferred habitat conditions (as described below) within the Hylebos Creek basin (see below), there was one report of a single sub-adult bull trout or Dolly Varden captured near the S 373rd Street crossing of West Fork Hylebos Creek in August 2018, approximately 3.9 miles downstream of the project footprint (Heltzel 2018 pers. comm.). Genetic analysis was not performed to verify whether the fish was a bull trout or a Dolly

Varden. This single observation should be considered in the context of decades of fish monitoring studies in the Hylebos Creek watershed conducted by Puyallup Tribal Fisheries. These studies have not encountered bull trout in the watershed (Marks et al. 2021). This individual bull trout or Dolly Varden likely strayed. For the purposes of this analysis, we are assuming that there is an extremely low probability for bull trout to be present within the Hylebos Creek drainage basin at any time of year and that if they were to occur, their distribution in the system would be transitory and in extremely low numbers.

Bull trout are strongly associated with snowmelt-dominated streams that maintain cold water temperatures in headwater tributaries year-round. Streams supporting bull trout have clean gravel substrates and cold water temperatures (less than 9ºC/48ºF) (63 FR 31693, June 10, 1998). Hylebos Creek is a rainfall-dominated stream that does not provide this type of habitat, and stream temperatures are regularly higher than the temperatures this species requires. Stream substrates in the Hylebos Creek watershed are dominated by fines, particularly near the project footprint. Water temperatures often exceed those preferred by bull trout. A 2001 water quality study of East Fork Hylebos Creek (east of I-5) indicated that temperatures frequently exceeded 14ºC in summer months at one of the stations (King County 2002). Such temperatures are likely to limit the presence of bull trout. West Fork Hylebos Creek and portions of its tributaries are included on the 303(d) list of impaired waters, based on temperatures exceeding 17ºC (Ecology 2023). Other 303(d) water quality impairments identified in the watershed include dissolved oxygen, heavy metals, copper, and bacteria, which may also limit the potential presence of bull trout (Ecology 2023). The Hylebos Waterway has 303(d) listings for chlorinated pesticides, DDT and metabolites, high molecular weight polycyclic aromatic hydrocarbons, and polychlorinated biphenyls, all of which detrimentally affect various life history stages of fish.

2.2.2 Puget Sound Chinook Salmon

Chinook salmon in the Puget Sound ESU are listed as threatened under ESA (64 FR 14308, March 24, 1999). The ESU includes naturally spawned Chinook salmon originating from rivers flowing into Puget Sound, along with Chinook salmon from 26 artificial propagation programs. Primary factors contributing to declines in Chinook salmon in the Puget Sound ESU include habitat blockages, genetic modification of wild fish through interbreeding with hatchery fish, urbanization, logging, hydropower development, harvests, and flood control and flood effects (NMFS 1998).

Chinook salmon have been documented in the Hylebos Creek watershed. Chinook salmon typically spawn in the mainstem channels of rivers and large tributaries, in riffles, and in pool tail outs where clean, gravel-dominated substrates are available. Compared to other Pacific salmon, spawning Chinook salmon require larger and deeper streams and pools (at least 3 feet deep), as well as larger gravel (up to 5.5 inches diameter). Such habitats are not available in the low-energy, intermittently flowing headwater tributaries present in the project area.

Chinook salmon are neither known nor expected to be present in the headwater tributaries to which treated stormwater from the project will be discharged. According to the SWIFD database, the closest watercourses where Chinook salmon have been documented, are presumed present, or could potentially be present are at least 1.5 miles downstream from any discharge points of stormwater facilities that will be built or reconfigured for this project (NWIFC 2023). Numerous human-made fish passage barriers, combined with small stream sizes and intermittent flow regimes, likely limits the movement of Chinook salmon into stream reaches in the project area (Ladley 2021a, pers. comm.).

Chinook salmon have been documented in Hylebos Creek and the lower reaches of West Fork Hylebos Creek (downstream of barriers), and they are presumed to be present in the lower 700 feet of East Fork Hylebos Creek (NWIFC 2023). Fisheries biologists from the Puyallup Tribe of Indians have documented Chinook salmon in West Fork Hylebos Creek as far upstream as S 356th Street, approximately 1.4 miles upstream of the upstream extent of the documented distribution of Chinook salmon in that stream, as mapped by NWIFC (NWIFC 2023).

Downstream human-made barriers to fish migration currently obstruct Chinook salmon from entering stream reaches in the project area. Table 2-2 provides an overview of the downstream distances to reaches where Chinook salmon have been documented or where their presence is not precluded by stream channel gradients (<= 16% stream gradient). The latter would become more accessible to Chinook salmon in the future, if all human-made downstream impediments to fish passage are removed. The table also identifies the number of human-made fish passage barriers between the project area and reaches where Chinook salmon have been documented. For each stream, the downstream distance is measured as the distance between the farthest downstream discharge point of a stormwater facility and the upstream extent of documented, presumed, or potential presence. The downstream distance to the documented presence of Chinook salmon in the West Fork Hylebos Creek subbasin is based on information provided by the Puyallup Tribe of Indians. The downstream distance to the documented presence of Chinook salmon in the East Fork Hylebos Creek subbasin is based on information from NWIFC (NWIFC 2023).

Table 2-2 Distribution and Impediments to Chinook Salmon Presence in the Project Area

Chinook Distribution and Human Made Barriers	West Fork Hylebos Creek Tributary 0014C	East Fork Hylebos Creek Tributary 0016A
Distance to the closest gradient-accessible reach$^{(1)}$	1.3 miles	1.1 miles
Distance to the closest reach with presumed presence	1.5 miles	3.7 miles
Distance to the closest reach with documented presence	1.5 miles	3.9 miles
Number of total barriers	4	4$^{(2)}$
Number of partial barriers	7	11$^{(2)}$
Number of human-made features unassessed for fish passage	4	2

Sources: NWIFC 2023; WDFW 2019, WDFW 2023b

Notes:

(1) Gradient-accessible reaches are those to which access is not precluded by stream channel gradients that pose a barrier to upstream migration (<= 16% stream gradient for Chinook). Please note that this is modeled data and is not meant to be a definitive statement about the distribution of a species or imply there are natural barriers due to stream gradient.

(2) Values in this table are based on barrier inventory data as of May 2023. WSDOT is developing plans for the correction of two total barriers and four partial barriers to fish passage on East Fork Hylebos Creek Tributary 0016A downstream of the project area. Installation of new, fish-passable structures at these sites will reduce barriers, but this will not provide access to stream reaches in the project footprint.

Based on the presence of human-made downstream barriers to fish passage, combined with intermittent flows and a lack of potentially suitable habitat, Chinook salmon are assumed to be absent from the Hylebos Creek tributaries near the project area. The remainder of this discussion describes Chinook salmon use of Hylebos Creek, West Fork Hylebos Creek, and the Hylebos Waterway.

Chinook salmon in the Hylebos Creek watershed are classified as fall-run. According to HDR Engineering, Inc. (HDR 2014), adults typically return to freshwater habitats in the Hylebos Creek watershed in August and September, with spawning occurring from mid-September through October. EarthCorps (2016) reported that Chinook salmon typically enter and spawn in Hylebos Creek and accessible tributaries between October and December of each year. Based on these characterizations, it is assumed for this analysis that adult Chinook salmon may be present in accessible streams in the Hylebos Creek watershed from August through December.

Fry emerge from spawning gravels in March and April, and they rear in the system between 2 to 12 months before migrating to Puget Sound (HDR 2014). Some juveniles migrate to salt water as subyearlings (i.e., a few weeks or months after hatching), while others rear in fresh water for a full year (Wydoski and Whitney 2003). Because juveniles may spend as much as a year in freshwater habitats in the Hylebos Creek watershed, it is assumed that they may be present in accessible streams in the action area at any time of year for this analysis.

The Puyallup Tribal Fisheries Department has documented Chinook salmon spawning in West Fork Hylebos Creek, primarily in the reach extending approximately 0.5 mile upstream from the confluence of West Fork Hylebos Creek and East Fork Hylebos Creek (Marks et al. 2021). Sediments in this reach of West Fork Hylebos Creek are dominated by sand and silt, but some small and isolated patches of suitable spawning habitat are available. Reaches of Hylebos Creek and West Fork Hylebos Creek in the action area also provide rearing habitat for juveniles, as well as serving as a migration corridor for Chinook salmon that may spawn in upstream reaches. Chinook salmon have been documented in West Fork Hylebos Creek as far upstream as S 356th Street (Ladley 2021b pers. comm.).

NMFS and USFWS (2009) determined that juvenile Chinook salmon typically are present in the estuarine waters of the Hylebos Waterway from March and early July, with peak numbers in late May or early June. Subyearling juvenile Chinook salmon have also been captured in Commencement Bay as early as January, during beach seining surveys (Ladley pers. comm., as cited in NMFS and USFWS 2009). Juveniles are generally observed more frequently near the mouths of the waterways than near the heads (Kerwin 1999), and observations are most frequent in the waterways closest to the Puyallup River (NMFS 2001).

As part of ongoing fish and habitat restoration efforts, the Puyallup Tribe has released approximately 10,000 to 20,000 juvenile fall-run Chinook salmon into West Fork Hylebos Creek annually, during the spring (Marks et al. 2021). These fish are produced by the Clarks Creek Hatchery Program, and they are included in the Puget Sound ESU (79 FR 20802, April 14, 2014). Hatchery fish have been identified on spawning grounds in West Fork Hylebos Creek (Marks et al. 2021).

2.2.3 Puget Sound Steelhead

The Puget Sound steelhead DPS is listed as a threatened species under the ESA (72 FR 26722, May 11, 2007). The DPS includes all naturally spawned anadromous winter-run and summer-run steelhead populations, in streams within the river basins of the Strait of Juan de Fuca, Puget Sound, and Hood Canal, Washington. The DPS also includes steelhead from artificial propagation programs in the Green River.

Steelhead have been documented in the Hylebos Creek watershed, and they may be present in some tributaries to Hylebos Creek in the action area. Detailed information about habitat use and the timing of steelhead presence is available for the Puyallup River, but not for streams in the Hylebos Creek watershed. Except where stated otherwise, descriptions of patterns of steelhead presence in the Hylebos Creek watershed are based on information from the Puyallup River watershed.

Steelhead have been documented in Hylebos Creek and the lower reaches of West Fork Hylebos Creek and East Fork Hylebos Creek (NWIFC 2023). The nearest watercourses where steelhead have been documented are at least 1.9 miles downstream from any discharge points of stormwater facilities that will be built or reconfigured for this project. Of the two headwater tributaries to which treated stormwater from the project will be discharged, steelhead have been documented only in the lowest reaches of East Fork Hylebos Creek Tributary 0016A, approximately 1.9 miles downstream from the project area. Approximately 1.3 miles of East Fork Hylebos Creek Tributary 0016A flows through or immediately adjacent to the project footprint and all but the upper 0.2 miles (800 feet) of that distance are considered gradient accessible to steelhead (<= 20% stream grade). The discharge point of TDA 13A (the furthest downstream discharge point from a project-related SWM to this stream) is in a reach characterized as gradient-accessible for steelhead—that is, access is not precluded by stream channel gradients that pose a barrier to upstream migration (access is, however, currently limited by the presence of anthropogenic barriers).

Numerous fish passage barriers, combined with small stream sizes and intermittent flow regimes, limits the movement of steelhead into stream reaches in the project area (Ladley 2021a, pers. comm.).

Table 2-3 provides an overview of the downstream distances to reaches where steelhead have been documented or where their presence is not precluded by stream channel gradients. The latter could become accessible to steelhead in the future if all downstream impediments to fish passage were removed. The table also identifies the number of fish passage barriers between the project area and reaches where steelhead have been documented. For each stream, the downstream distance is measured as the distance between the farthest downstream discharge point of a stormwater facility and the upstream extent of documented, presumed, or potential presence, based on information from NWIFC (2023).

Based on the presence of human-made downstream barriers to fish passage, combined with intermittent flows and a lack of potentially suitable habitat, steelhead are assumed to be currently absent from the Hylebos Creek tributaries near the project area. The remainder of this discussion describes steelhead use of Hylebos Creek, its major tributaries, and the Hylebos Waterway.

Table 2-3 Distribution and Impediments to Steelhead Presence in the Project Area

Steelhead Distribution and Human Made Barriers	West Fork Hylebos Creek Tributary 0014C	East Fork Hylebos Creek Tributary 0016A
Distance to nearest gradient-accessible reach(1)	1.3 miles	Gradient Accessible
Distance to nearest reach with presumed presence	N/A	N/A
Distance to nearest reach with documented presence	2.7 miles	1.9 miles
Number of total barriers	4	4(2)
Number of partial barriers	7	13(2)
Number of human-made features unassessed for fish passage	4	2

Sources: NWIFC 2023; WDFW 2019; WDFW 2023a

Notes:

(1) Gradient-accessible reaches are those to which access is not precluded by stream channel gradients that pose a barrier to upstream migration (<=20 stream gradient for steelhead). Please note that this is modeled data and is not meant to be a definitive statement about the distribution of a species or imply there are natural barriers due to stream gradient.

(2) Values in this table are based on barrier inventory data as of May 2023. WSDOT is developing plans for the correction of 2 total barriers and 4 partial barriers to fish passage on East Fork Hylebos Creek Tributary 0016A downstream of the project area. Installation of new, fish-passable structures at these sites will reduce barriers but will not provide access to stream reaches in the project footprint.

Steelhead in the Hylebos Creek watershed are predominantly a winter-run population. The principal spawning stock of steelhead in the Puyallup River system generally enters the river system from January through June, with peak migration occurring in mid- to late April and early May (Marks et al. 2021). In addition, a few individuals, likely strays from summer-run populations in the Green or Skykomish Rivers, are caught in the lower Puyallup River each year during August and September (Marks et al. 2021). WDFW does not recognize a summer run population of steelhead in the Puyallup River system, and only the winter run populations are included in the ESA-listed Puget Sound DPS (NMFS and USFWS 2009).

Juvenile steelhead typically rear in freshwater habitats for 2 years (range: 1 to 4) before migrating to marine waters (Marks et al. 2021). Juvenile out-migration takes place primarily in April and May, although a few individuals have been observed out-migrating as late as late-July (NMFS and USFWS 2009).

Information on recent observations of steelhead in the Hylebos Creek watershed is limited. No juvenile or adult steelhead were observed during habitat surveys and electrofishing surveys in several reaches of East Fork Hylebos Creek and West Fork Hylebos Creek in 2014 (HDR 2014). NWIFC (2023) does not classify any stream reaches in the Hylebos Creek watershed as documented spawning habitat. Marks et al. (2021) characterized the spawning frequency for this species in Hylebos Creek as low and inconsistent. NMFS and USFWS (2009) reported that steelhead spawn in the Hylebos Creek watershed occasionally, primarily in West Fork Hylebos Creek between S 373rd Street and SR 99, approximately 2.5 miles downstream from the project area.

Based on these observations, it is assumed for this analysis that steelhead may spawn in the Hylebos Creek watershed, albeit in low numbers and probably not every year. The nearest spawning areas are approximately 2.5 miles downstream from the downstream-most discharge point from a stormwater treatment facility in West Fork Hylebos Creek Tributary 0014C. Adults may be present in accessible streams from January through June, with the highest probability of presence occurring during the peak migration period (April and May).

Juveniles could be present at any time of year, albeit in low numbers and with low probability. The quality of rearing habitat in the action area is limited by the lack of suitable substrates and by elevated water temperatures during summer. Juvenile steelhead in the Hylebos Creek watershed are most likely to rear in lower reaches.

2.2.4 Puget Sound/Georgia Basin Bocaccio

The Puget Sound/Georgia Basin DPS of bocaccio was listed as “endangered” under the ESA on April 28, 2010 (75 CFR 22276). The DPS includes all bocaccio found in the waters of Puget Sound, the Strait of Georgia, and the Strait of Juan de Fuca east of Victoria Sill. Population declines for bocaccio, like all rockfish species in Puget Sound, were historically attributed to overfishing (Palsson et al. 2009; Drake et al. 2010; Williams et al. 2010); however, today there is some uncertainty about the relative impact of some fisheries and of other additional threats, including degraded water quality and habitat, contaminants, and derelict fishing gear, among others on population declines (Palsson et al. 2009, WDFW 2013).

Subadults and adult bocaccio typically occupy waters deeper than 120 feet (Love et al. 2002) and are therefore not expected to be present in the lower tidally influenced portions of Hylebos Creek. If any bocaccio were to enter the action area, they would likely do so as larvae; rockfish at that life stage are pelagic drifters, carried by the currents. Juveniles settle onto rocky or cobble substrates in shallow nearshore water at 3 to 6 months of age, moving to progressively deeper waters as they grow (Love et al. 2002). Juvenile bocaccio may also recruit to sandy zones with eelgrass or drift algae (Love et al. 2002). This habitat is not available within lower Hylebos Creek. Overall, the potential for use of the action area by bocaccio is by the larval life history form and likely only on incoming tidal conditions.

2.2.5 Puget Sound/Georgia Basin Yelloweye Rockfish

The Puget Sound/Georgia Basin DPS of yelloweye rockfish was listed as “threatened” under the ESA on April 28, 2010 (75 CFR 22276). This DPS includes all yelloweye rockfish found in the waters of Puget Sound, the Strait of Georgia, and the Strait of Juan de Fuca east of Victoria Sill. are not expected to occupy nearshore waters at any life stage and are therefore very unlikely to be in the action area when project activities are underway. Recent research has found evidence for two populations of yelloweye rockfish within the DPS—one in Hood Canal and one within the rest of the Puget Sound/Georgia Basin (NMFS 2017). Threats to yelloweye rockfish are similar to that identified above for bocaccio.

Similar to bocaccio, adult yelloweye rockfish are found in deep water habitats ranging from 90 to 1,394 feet (30-425 m) in depth (Orr et al. 2000; Love et al. 2002) and have a strong affinity to substrate. Juvenile yelloweye rockfish are not typically found in intertidal waters (Love et al. 1991; Studebaker et al. 2009). In British Columbia, juvenile yelloweye rockfish have been observed at a mean depth of 239 feet (73 m), with a minimum depth of 98 feet (30 m) (Yamanaka et al. 2006). Neither of these habitats are present within the project action area. Larval yelloweye rockfish are often associated with free-floating algae, seagrass, and detached kelp (Love et al. 2002; Shaffer et al. 1995) and can be found anywhere in the water column (Weis 2004). As larval yelloweye rockfish are subject to currents and tidal action, it is possible for larval rockfish to be present, albeit in low numbers, within the lower tidally influenced portion of Hylebos Creek during incoming tides. Larval fish would likely be flushed out of lower Hylebos Creek on an outgoing tide.

2.2.6 Southern Resident Killer Whale

The southern resident DPS of killer whales was listed as endangered on February 16, 2006 (70 FR 69903), and a recovery plan was completed in 2008. In 2021, NMFS completed a 5-year review and concluded that southern resident killer whales (SRKWs) should remain listed as endangered (NMFS 2021). The recovery plan identified several factors that may be limiting SRKW recovery, including quantity and quality of prey, toxic chemicals that accumulate in top predators, and disturbance from sound and vessels (NMFS 2008). Oil spills are also a risk factor. It is likely that multiple threats are acting together to impact the whales. Although it is not clear which threat or threats are having the largest impact on the survival and recovery of SRKWs, all the threats identified are potential limiting factors in the population dynamics of the DPS (NMFS 2008).

The action area does not include any areas of marine habitat where SRKWs are likely to be present. The aquatic component of the action area extends to the points at which Hylebos Creek enters the Hylebos Waterway. SRKWs are unlikely to enter in the shallow waters of Commencement Bay, and they are even less likely to enter the narrow confines of the Hylebos Waterway. Based on the above, the project has no potential to directly affect SRKWs or their habitat. However, based on the potential for adverse impacts on Chinook salmon, analyses in this BA consider potential indirect impacts on this species. Chinook salmon make up a large proportion of SRKW diets: it is estimated that Chinook salmon are approximately 70 percent of SRKW diet during winter and spring and more than 90 percent during summer and fall (NMFS 2021).

2.3 Presence of Federally designated or Proposed Critical Habitat in the Project Action Area

Designated or proposed critical habitat for bull trout, streaked horned lark, yellow-billed cuckoo, marbled murrelet, bocaccio, or yelloweye rockfish is not present in or near the Action Area.

- The nearest designated critical habitat for streaked horned larks is more than 80 miles from the project area.
- No critical habitat for the yellow-billed cuckoo has been designated in Washington.
- The nearest designated critical habitat for marbled murrelet is more than 30 miles from the project area.
- Designated critical habitat for bocaccio and yelloweye rockfish does not include Hylebos Creek or any of its tributaries.
- Designated critical habitat for bull trout does not include Hylebos Creek or any of its tributaries.

Based on the above, the project will have **no effect** on critical habitat for these species.

2.3.1 Puget Sound Chinook Salmon Critical Habitat

The final rule designating critical habitat for Puget Sound Chinook salmon included the main stem of Hylebos Creek and the West Fork Hylebos Creek downstream of S 373rd Street (west of I-5), (70 FR 52630, September 2, 2005). No Critical habitat for Chinook has been designated in the East Fork Hylebos Creek or any of its tributaries.

Specific Physical and Biologic Features (PBFs) for Chinook salmon in freshwater and nearshore marine/estuarine areas, as defined by NMFS, include the following:

1. Freshwater spawning sites with water quantity and quality conditions and substrate supporting spawning, incubation, and larval development
2. Freshwater rearing sites with water quantity and floodplain connectivity to form and maintain physical habitat conditions and support juvenile growth and mobility; water quality and forage supporting juvenile development; and natural cover such as shade, submerged and overhanging large wood, log jams and beaver dams, aquatic vegetation, large rocks and boulders, side channels, and undercut banks
3. Freshwater migration corridors free of obstruction with water quantity and quality conditions and natural cover such as submerged and overhanging large wood, aquatic vegetation, large rocks and boulders, side channels, and undercut banks supporting juvenile and adult mobility and survival
4. Estuarine areas free of obstruction with water quality, water quantity, and salinity conditions supporting juvenile and adult physiological transitions between freshwater and saltwater; natural cover such as submerged and overhanging large wood, aquatic vegetation, large rocks and boulders, and side channels; and juvenile and adult forage, including aquatic invertebrates and fishes, supporting growth and maturation
5. Nearshore marine areas free of obstruction with water quality and quantity conditions and forage, including aquatic invertebrates and fishes supporting growth and maturation, and natural cover such as submerged and overhanging large wood, aquatic vegetation, large rocks and boulders, and side channels

Freshwater habitats in Hylebos Creek and West Fork Hylebos Creek in the action area likely support PBFs 2 and 3. Estuarine areas in the lower reaches of Hylebos Creek likely support PBF 4. PBF 1 is present only in the reaches of West Fork Hylebos Creek where Chinook salmon spawn. The action area does not include nearshore marine habitats; therefore, PBF 5 is not pertinent to this analysis.

2.3.2 Puget Sound Steelhead Critical Habitat

The lower reaches of West Fork Hylebos Creek and East Fork Hylebos Creek, approximately 1.3 to 1.9 miles downstream from the project footprint, respectively, are included in the designated critical habitat for Puget Sound steelhead under 81 FR 9251 (February 24, 2016). Critical habitat for Puget Sound steelhead is defined by the same PBFs as those identified above for Chinook salmon. Freshwater habitats in East Fork Hylebos Creek, West Fork Hylebos Creek, in the action area likely support PBFs 2 and 3. Estuarine areas in the lower reaches of Hylebos Creek likely support PBF 4. PBF 1 is present only in the reaches of West Fork Hylebos Creek where steelhead are known or expected to spawn occasionally and infrequently. The action area does not include nearshore marine habitats; therefore, PBF 5 is not pertinent to this analysis.

2.3.3 Southern Resident Killer Whale

The critical habitat of SRKW has been designated to include all marine waters of Puget Sound where depths are greater than 20 feet (86 FR 41668). Three habitat features essential to the conservation of the DPS include: 1) water quality to support growth and development; 2) prey species of sufficient quantity, quality, and availability to support individual growth, reproduction, and development, as well as overall population growth; and 3) passage conditions to allow for migration, resting, and foraging. While the geographic definition of SRKW critical habitat does not overlap with the project action area, the second PBF, prey species, may be affected via trophic web interactions.

The potential for the project to have adverse impacts on Chinook salmon leads to the possibility of indirect effects to the quantity, quality, and availability of prey for killer whales.

3 ENVIRONMENTAL SETTING

Before describing the potential effects of the project action, it is important to define the environmental baseline.

“The environmental baseline includes the past and present impacts of all Federal, State, or private actions and other human activities in the action area, the anticipated impacts of all proposed Federal projects in the action area that have already undergone formal or early Section 7 consultation, and the impact of State or private actions which are contemporaneous with the consultation in process. The consequences to listed species or designated critical habitat from ongoing agency activities or existing agency facilities that are not within the agency's discretion to modify are part of the environmental baseline.” (50 CFR 402.02)

The OMF South mainline guideway will begin at the southern terminus of the FWLE in the Commons at Federal Way mall development area located between S 320th Street and South 324th Street and then turn southeast to travel down WSDOT’s southbound I-5 right-of-way to the guideway’s southern terminus at S 344th Street. The I-5 corridor is located immediately to the east of the guideway and land use to the west is a mixture of multi-and single-family residential, commercial, and institutional (Christian Faith Center) land uses with some vacant land. Land that is currently vacant is typically encumbered by sensitive habitats including wetlands, streams, forested buffers, and regional stormwater detention facilities. The OMF South site is largely occupied by institutional and commercial land uses with vacant land positioned between the OMF facility and guideway to the east. Overall, the project area is located within a highly developed urban/ suburban environment Figure 3-1.

Eighteen wetlands and two streams were identified in the immediate project area (Parametrix 2023). Wetland and streams affected by the proposed action are discussed in more detail in Section 3.2 below.

Project biologists Steve Krueger, Anna Hoenig, Mike Hall, and Josh Wozniak characterized riparian, wetland, and upland habitat in the Action Area during several site visits ranging from Fall 2019 to Spring 2023. Project area photographs are presented in Appendix F.

3.1 Terrestrial Species and Habitats

Mature forested habitat in the action area is largely restricted to riparian buffer habitats in undeveloped parcels. Mature forested buffers are dominated by Douglas-fir, western red cedar, black cottonwood, and red alder. Forested wetlands areas in the study area are dominated by Pacific willow, red alder, Oregon ash, and black cottonwood, with an understory of Douglas’ spiraea, salmonberry, Himalayan blackberry, slough sedge, and reed canarygrass. Scrub-shrub wetland areas in the study area are dominated by Scouler’s willow, Pacific willow, salmonberry, Himalayan blackberry, red-twig dogwood, and Douglas’ spiraea. Because there are no listed terrestrial species within the project Action Area, the focus of this assessment will be on species associated with aquatic habitats.

3.2 Aquatic Species and Habitats

The project area contains two streams that will be affected by project construction or that include discharge points from project SWM facilities. Both streams are headwater tributaries in the Hylebos Creek watershed (West Fork Hylebos Creek Tributary 0014C and East Fork Hylebos Creek Tributary 0016A).

West Fork Hylebos Creek Tributary 0014C and East Fork Hylebos Creek Tributary 0016A are both west of I-5 in the project area and have been heavily modified to accommodate urban development. Downstream of the project limits, the streams pass through many culverts, most of which are complete or partial barriers to fish passage (WDFW 2023a). Impediments to fish passage include water velocity, surface water drops, and steep slopes. Furthermore, several of the pipes are long and have bends. While long and irregularly shaped culverts are not defined as barriers, such structures are known to inhibit the progress of fish upstream. Within the project area, both streams are intermittent, and flow is often tied to precipitation and seasonally high groundwater. Streambeds in the project vicinity are typically dry during summer and early fall. These tributaries flow into East Fork Hylebos Creek and West Fork Hylebos Creek, which converge to form Hylebos Creek south of the project area near Fife. Hylebos Creek then flows west and north, emptying to marine waters in Commencement Bay at the Hylebos Waterway.

These waterbodies are described in the sections below and shown in Figure 3-2, Figure 3-3, and Figure 3-4. Discussions of the use of these waterbodies by ESA-listed fish are included in Section 2.2.

3.2.1 West Fork Hylebos Creek Tributary 0014C

The entirety of West Fork Hylebos Creek Tributary 0014C is within the aquatic component of the action area because SWM facilities built or modified for the project will discharge to the stream and the proposed action will also replace one culvert on this stream.

West Fork Hylebos Creek Tributary 0014C first daylights west of I-5 within the Belmor Park manufactured home community and country club. The stream flows south through residential developments before entering a series of stormwater detention ponds near S 336th Street (Appendix F; Photos 1-3). The stream then crosses SR 99 through a long, jointed pipe. Approximately 1.5 miles downstream from the project limits, in Hylebos Creek Wetlands Park, West Fork Hylebos Creek Tributary 0014C joins other tributaries to form West Fork Hylebos Creek. The upstream reaches of West Fork Hylebos Creek Tributary 0014C, including the immediate project area, flow only intermittently. Numerous barriers to fish passage exist downstream of the project limits (see Table 2-2 and Table 2-3 and Figure 1-8).

Urbanization in the stream basin has contributed to altered peak and base flows in West Fork Hylebos Creek Tributary 0014C (King County 1990). As a result, the City of Federal Way has initiated and completed numerous flood control projects, including large SWM facilities, throughout the basin. The portion of West Fork Hylebos Creek Tributary 0014C within the project footprint is contained wholly within two consecutive combined wetland and in-line regional stormwater detention facilities with the first located immediately north of S 336th Street and the other situated between South 336th Street to the north and State Route (SR) 99 to the southwest (Appendix F: Photos 1-3). These in-line detention facilities are also considered wetlands and were delineated as such as part of the proposed action. More detail on these

Streams and Wetlands in Project Area: OMF Site
Biological Assessment

OMF South

DRAFT: For internal discussion only. Not reviewed or approved on behalf of any party.

wetlands (WFW-02 and WFW-33) can be found in Section 3.2.7 below. The stream enters the wetland/detention facility from the north at South 336th Street. Sediment accumulation within the detention facility has filled any prior defined channel that may have existed prior to creation of the detention facility. West Fork Hylebos Creek Tributary 0014C exits the detention facility via a water control structure, where it is piped west across SR 99. The stormwater detention facility was historically a wetland that was modified by the City of Federal Way as part of a flood mitigation program, which resulted in construction of 4- to 6-foot-high earthen berms along the western and southern boundaries to allow the wetland to provide for greater stormwater storage. Although modified, the area remains a Category II palustrine forested (PFO) wetland. Dominant vegetation in the wetland consists primarily of Pacific willow (*Salix lucida*) and black cottonwood (*Populus trichocarpa*). Understory species include red-twig dogwood (*Cornus alba*), salmonberry (*Rubus spectabilis*), and hardhack (*Spiraea douglasii*).

The segment of West Fork Hylebos Creek within the action area is on the 303(d) list of impaired waters, based on violations of state standards for copper, lead, zinc, dibenzo(a,h)anthracene, and benzo(a)pyrene (Ecology 2023). Other 303(d)-listed reaches have been identified downstream in the West Fork Hylebos Creek for temperature, dissolved oxygen, fecal coliform bacteria, and benthic macroinvertebrate bioassessment and in the mainstem Hylebos Creek for bacteria. Large amounts of impervious surface area in the upper watershed have likely contributed to elevated levels of pollutants associated with vehicle use, including metals such as copper, lead, and zinc. No fish use has been documented within this reach of West Fork Hylebos Creek (NWIFC 2023; WDFW 2023b).

3.2.2 East Fork Hylebos Creek Tributary 0016A

The entirety of East Fork Hylebos Creek Tributary 0016A is within the aquatic component of the action area because the stream will receive effluent from SWM facilities and because the project will replace two culverts and remove one culvert in its entirety (see Section 1.3.2).

The headwaters of East Fork Hylebos Creek Tributary 0016A are in a wetland complex northeast of I-5 and S 320th Street. After passing under I-5, the S 320th Street Park & Ride, and Winged Foot Way, the stream daylights within the golf course of the Belmor Park manufactured home community where the northern extent of this project is located. The stream then flows southward through a series of piped and open-channel segments for approximately 2.1 miles, confined by I-5 to the east and light industrial, commercial, and residential development to the west. Near S 356th Street, the stream turns east, crosses under I-5, and joins East Fork Hylebos Creek after converging with other tributaries.

West (downstream) of I-5, habitat conditions in East Fork Hylebos Creek Tributary 0016A are similar to those in West Fork Hylebos Creek Tributary 0014C. Much of the stream in this area is confined within a straight, ditch-like channel profile, and fish habitat is poor (Appendix F: Photos 4-6). The stream gradient is low, and accumulations of fine sediments have resulted in the shallowing and widening of the streambed. Supported by intermittent flow, dense patches of reed canarygrass grow in low-energy areas, exacerbating deposition of fine sediments. While the overall habitat quality is poor, the streams does flow through areas dominated by riparian wetlands and native forest. Forested riparian areas are dominated by red alder (*Alnus rubra*), black cottonwood, and Oregon ash (*Fraxinus latifolia*), with an understory consisting of salmonberry and vine maple (*Acer circinatum*). Farther downstream, well outside the project limits, the stream passes through areas dominated by wetlands and native forest and provides moderate-quality habitat.

East Fork Hylebos Creek Tributary 0016A flows intermittently in and near the project limits. The streambed in this area is typically dry during summer and early fall. The stream channel was completely dry during a reconnaissance survey in a reach immediately east of the proposed maintenance on October 9, 2019, and a soil pit excavated to a depth of 20 inches below the ground surface elevation in the stream failed to reach the groundwater table (Appendix F: Photo 4). Rainfall had been above normal during the preceding month (3.32 inches, compared to a normal of 1.61 inches) as well as the preceding 3 months (5.67 inches, compared to normal of 3.18 inches). Two weeks later (October 22, 2019), after several days of consistent rainfall, flows were re-established in the stream channel. East Fork Hylebos Creek Tributary 0016A is not on the 303(d) list of impaired waters (Ecology 2023).

There is no documented or presumed fish use in the upper reaches of East Fork Hylebos Creek Tributary 0016A (i.e., in areas where project construction will entail ground-disturbing work in or near the stream channel). Under current conditions, human-created barriers to fish passage obstruct anadromous salmonids from entering stream reaches in the project area (NWIFC 2023; see Tables 2-2 and 2-3 and Figure 1-8). The presence of resident fish is unlikely, given the intermittent flow of the stream and the presence of barriers between the study area and potential population sources downstream. However, the basin size, channel width, and gradient of the stream indicate the potential to support fish in the future. Furthermore, other projects are currently planned to remove several of the downstream barriers (for example, the I-5/SR 161/SR 18 Triangle Interchange project). If access is restored, the upper reaches of East Fork Hylebos Creek Tributary 0016A in and near the project limits have the potential to provide rearing habitat for juvenile salmonids.

3.2.3 West Fork Hylebos Creek

Reaches of West Fork Hylebos Creek, downstream of the West Fork Hylebos Creek Tributary 0014C confluence, are within the aquatic component of the action area. The only potential project-related impacts on this stream are associated with water quality; treated stormwater from SWM facilities that discharge to West Fork Hylebos Creek Tributary 0014C have the potential to affect water quality in West Fork Hylebos Creek. Therefore, this discussion focuses on water quality and use of this stream by fish.

West Fork Hylebos Creek is a perennial stream. A segment of the stream near S 373rd Street is included on the 303(d) list of impaired waters, based on elevated temperatures, low levels of dissolved oxygen, and elevated levels of fecal coliform bacteria (Ecology 2023).

Like the tributary streams described above, the West Fork Hylebos Creek basin has been affected by extensive urban development. In contrast to the smaller tributaries, large riparian wetland complexes in the West Fork Hylebos Creek basin help maintain base flow conditions and attenuate peak flows. Hydrologic conditions are still not optimal, however, and flood storage is still an issue.

Chinook salmon, coho salmon, steelhead, chum salmon (*Oncorhynchus keta*), and cutthroat trout (*O. clarkii clarkii*) have been documented in West Fork Hylebos Creek (NWIFC 2023; WDFW 2023b). The Puyallup Tribal Fisheries Department has documented Chinook salmon, chum salmon, coho salmon, pink salmon, and steelhead spawning in West Fork Hylebos Creek between SR-99 and the confluence with the East Fork Hylebos Creek (Marks et al. 2018). West Fork Hylebos Creek is a migratory corridor for all these species and provides rearing habitat for juvenile cutthroat trout, coho salmon, Chinook salmon, and steelhead. Salmonid distribution within West Fork Hylebos Creek is not anticipated to extend into West Fork Hylebos Creek Tributary 0014C within the project area.

3.2.4 East Fork Hylebos Creek

Reaches of East Fork Hylebos Creek, downstream of the East Fork Hylebos Creek Tributary 0016A confluence, are within the aquatic component of the action area. The only potential project-related impacts on this stream are associated with water quality; treated stormwater from SWM facilities that discharge to East Fork Hylebos Creek Tributaries 0016A and 0016B has the potential to affect water quality in East Fork Hylebos Creek. Therefore, this discussion focuses on water quality and use of this stream by fish.

East Fork Hylebos Creek is a perennial stream. The stream segment in the action area is included on the 303(d) list of impaired waters, based on elevated levels of fecal coliform bacteria (Ecology 2023b).

Chum salmon, coho salmon, and steelhead have been documented in East Fork Hylebos Creek, and reaches of the stream in the action area provide spawning habitat for coho salmon (NWIFC 2023; WDFW 2023b). Neither Chinook salmon nor pink salmon have been documented, but the stream is classified as gradient-accessible for both species (NWIFC 2023). Salmonid distribution within East Fork Hylebos Creek is not anticipated to extend into East Fork Hylebos Creek Tributary 0016A within the project area.

3.2.5 Hylebos Creek (Mainstem)

The entirety of mainstem Hylebos Creek is within the aquatic component of the action area. The only potential project-related impacts on this stream are associated with water quality; treated stormwater from SWM facilities that discharge to headwater tributaries has the potential to affect downstream water quality in Hylebos Creek. Therefore, this discussion focuses on water quality and use of this stream by fish.

Hylebos Creek originates at the confluence of West Fork Hylebos Creek and East Fork Hylebos Creek, east of I-5. The stream flows south before crossing under the freeway, then veers northwest to the Hylebos Waterway. Hylebos Creek is tidally influenced to approximately 0.5 mile upstream from the Hylebos Waterway.

Hylebos Creek is currently identified on 303(d) list of impaired waters for exceeding water quality standards for bacteria (Ecology 2023). Additional water quality impairments have been identified in several upstream tributaries, including East Fork Hylebos Creek, West Fork Hylebos Creek, and the Hylebos Waterway.

Currently, there are no barriers to fish passage downstream on the mainstem Hylebos Creek (WDFW 2023a). Steelhead and Chinook salmon presence has been documented within Hylebos Creek mainstem (NWIFC 2023).

Hylebos Creek in the action area flows through low-gradient floodplain habitat with some slight sinuosity. Habitats are dominated by deep mid-channel and lateral scour pool habitats. Large woody material is present in small quantities within the reach. The potential for future recruitment is limited by the lack of large, mature stands of trees in this reach, combined with the limited ability of upstream areas to transport large woody material to the area. The lack of in-stream and canopy cover reduces the quality of pool habitats. Sediments are dominated by fine materials, including sand and silt. While there is an overall lack of in-stream cover, pool depth is likely sufficient to provide important rearing habitat for juvenile salmonids. While there is some access to floodplain habitats from the main stem, there is a lack of off-channel and side channel habitats that could provide additional rearing habitat for juvenile salmonids.

3.2.6 Hylebos Waterway

The aquatic component of the action area ends where Hylebos Creek enters the Hylebos Waterway, which is a narrow, excavated extension of Commencement Bay. Modification of the historical estuary created a highly developed, industrial upland area surrounding the waterway. Due to pollution from industrial activities, the waterway was declared part of the Commencement Bay/Near Shore/Tideflats Superfund Site in 1983. The Hylebos Waterway has 303(d) listings for chlorinated pesticides, DDT and metabolites, high molecular weight polycyclic aromatic hydrocarbons, and polychlorinated biphenyls (Ecology 2023). Cleanup in the Hylebos Waterway involved sediment removal in the head (from 2004 to 2006) and mouth (from 2004 to 2006) of the Hylebos Waterway, and cleanup is ongoing for some sections of the waterway (EPA 2022; Port of Tacoma 2022). Source control efforts include monitoring groundwater for contaminants (EPA 2022). Water temperatures in the adjacent Sitcum Waterway are likely similar to the Hylebos Waterway and range from 47° F/8° C to 58° F/14° C (as recorded in 2021) (National Centers for Environmental Information [NCEI] 2022).

Based on poor water quality, the lack of complex habitat features, and high levels of boat traffic and other sources of disturbance, anadromous salmonids (including ESA-listed species) that pass through the Hylebos Waterway on their way to habitats in the Hylebos Creek system are unlikely to remain in the waterway for extended periods.

3.2.7 Wetlands

Freshwater forested/shrub and riverine wetlands are mapped within the study area (USFWS 2023, WDFW 2023b, WDNR 2023b, City of Federal Way 2023). These wetlands are typically riverine and associated with the two identified streams. Resident fish use is unlikely due to intermittent flows and multiple migration barriers (Parametrix 2021), but the wetlands could provide limited habitat functions if barriers were removed. Generally, wetland and buffer habitats lack connectivity to larger corridors, as the surrounding areas are limited by development and roads. However, wetland and buffers are forested and do provide water quality, screening, and shade functions. In addition to previously mapped wetlands, Parametrix and HDR delineated 18 wetlands in the portion of the study area where property access was granted. These wetlands include those wetlands previously identified by other sources; however, many unidentified wetlands were also added. Table 3-1 below includes a summary of wetlands delineated in the project study area. Figure 3-3 and Figure 3-4 show the location of wetlands in relation to the project footprint.

Table 3-1 Summary Characteristics of Wetlands in the Project Area by Drainage Basin

Wetland Name	HGM Classification[1]	USFWS Classification[2]	Approximate Wetland Acreage in Study Area (Acres)	Wetland Rating (Ecology)[3]
West Fork Hylebos Creek Tributary 0014C Drainage Basin

4 EFFECTS OF THE ACTION

The following subsections describe potential effects on ESA-listed species and critical habitat. Direct effects include all immediate impacts from project-related actions, such as habitat loss, disturbance due to construction noise and activity, and work in or near waters where ESA-listed fish may be present. Indirect effects, also known as delayed consequences, include effects that are reasonably certain to occur as a result of the proposed action, but later in time (generally after construction is complete). The term “insignificant” indicates that the impact of an action never reaches the level where take occurs or where adverse modification of critical habitat occurs. The term “discountable” indicates that it is extremely unlikely that impacts will occur.

Because there are no listed terrestrial species or their critical habitat within the project Action Area, the focus of this assessment is on the effects of the action on listed aquatic species.

4.1 Direct Effects

Ground-disturbing work in and near East Fork Hylebos Creek Tributary 0016A and West Fork Hylebos Creek Tributary 0014C’s channels will have the potential to introduce sediment and contaminants into the water. If water is present in the stream channel where ground-disturbing work occurs, elevated turbidity could extend up to 100 feet downstream from the project footprint. As discussed in Section 2.2, numerous downstream barriers to human-made fish passage limit access by ESA-listed fish to both streams within 1 mile of the project footprint. As such, construction-related turbidity has no potential to affect ESA-listed fish. In addition, the potential for construction-related impacts on water quality will be avoided through implementation of conservation measures and BMPs specified in the SWPPP and TESC plan that will be prepared and implemented before project construction begins. Moreover, the measures specified in Section 1.4 will be implemented, and they will reduce or eliminate the potential for water quality impacts during construction.

Based on the above, construction activities in and near streams (including fish exclusion) have no potential to affect ESA-listed fish. Finally, no critical habitat for any ESA-listed species is present in or near the project footprint. For these reasons, the project will have no direct effects on ESA-listed species or critical habitat. The remainder of this section analyzes potential indirect effects, effects of interrelated and interdependent activities, and cumulative impacts.

4.2 Indirect Effects

Indirect effects may result from the operation of the project (e.g., long-term impacts on water quality) or from future activities related to the project (e.g., induced land use change or growth). Indirect effects can also include beneficial effects resulting from habitat enhancement. Analyses in this section address effects resulting from changes in the amount of impervious surface in the action area, potential changes in land use, potential changes in prey abundance, impacts to riparian habitat along stream reaches that may eventually become accessible to fish, and stream habitat enhancement (i.e., daylighting, fish passage barrier removal).

Although ESA-listed fish currently do not have access to stream reaches near any of the riverine wetlands in the project area (see Table 3-1 for a list of riverine wetlands in the project Action Area), the riverine wetlands provide some level of ecological functions for downstream watersheds. Impacts to these forested wetlands could contribute to degradation of habitat quality in waters currently accessible to ESA-listed fish—or to waters that are rendered accessible by future barrier correction projects.

4.2.1 Stormwater

The proposed action will result in a net increase in PGIS within the action area. Runoff from new and replaced PGIS and non-pollution generating impervious surfaces will be directed to CSTW/DP facilities (some with sand filters) or to vaults with pre-settling basins and sand filters to provide enhanced treatment and flow control.

As discussed below, contaminant levels in treated stormwater runoff entering those streams will be further reduced through infiltration and adsorption to organic material in stream channels, ditches, incidental infiltration and adsorption to organic material as water flows overland, and regional SWM facilities before entering stream reaches where ESA-listed fish may be present. For the foreseeable future, the potential for ESA-listed fish to be exposed to contaminants that may remain in treated or untreated stormwater will be reduced by the distance between the project area and stream reaches that are accessible to these species. Under future conditions and if all downstream barriers that impede fish access are removed, the potential exists for fish to access habitats in the action area and be exposed to project generated stormwater.

Runoff from PGIS that is created or replaced by the project will be treated in accordance with the guidelines found in King County's most recent Surface Water Design Manual, which represents the best available science for stormwater treatment and flow control. Implementation of these practices is expected to minimize the frequency and intensity of exposure of ESA-listed fish to elevated concentrations of pollutants (including dissolved metals and other chemical contaminants) in runoff from impervious surfaces created or replaced by the project.

Nevertheless, according to scientific research, residual contaminants in stormwater runoff from PGIS can harm ESA-listed fish, even after the water has been treated to reduce pollutant loads. ESA-listed fish in receiving waters may be exposed to contaminants in stormwater that is discharged to the receiving waters, or they may be exposed by consuming contaminated prey. Effects of exposure may range from avoidance of affected areas, to reduced growth, altered immune function, or mortality. The intensity of effects depends largely on the pollutant, its concentration, and/or the duration of exposure (Brette et al. 2014; Feist et al. 2011; Gobel et al. 2007; Incardona et al. 2004, 2005; McIntyre et al. 2012; Meador et al. 2006; Sandahl et al. 2007; Spromberg et al. 2016). Repeated exposure, even at very low concentrations, may also result in adverse effects (Feist et al. 2011; Spromberg and Meador 2006; Spromberg and Scholz 2011).

Examples of stormwater contaminants that may harm ESA-listed fish include polycyclic aromatic hydrocarbons, which have been found to cause reduced growth, increased susceptibility to infection, and increased mortality in salmonids (Meador et al. 2006; Varanasi et al. 1993). Another common component of stormwater runoff is copper, which can impair the olfactory system of salmonids and hinder their predator avoidance behavior (Sandahl et al. 2007).

In addition, recent research has found 6PPD-quinone, a contaminant found in runoff from roadways, to be a major contributor to pre-spawning mortality in coho salmon (Tian et al. 2021). The effects of this contaminant on ESA-listed Chinook salmon, steelhead, and bull trout are still being studied, but some of the early studies indicate that first flush storm events are lethal to juvenile coho, steelhead, and Chinook salmon (French et al. 2022). However, the concentration at which 6PPD-quinone in stormater may have toxic effects on those species is still being evaluated. Research has shown that in addition to juvenile coho, both juvenile steelhead (*Oncorhynchus mykiss*) and juvenile Chinook salmon (*Oncorhynchus tshawytscha*) are also vulnerable to untreated stormwater containing 6PPD-quinone; however, the effects are not as immediate and instead of mortality occurring within a few hours of exposure (up to 4 hours for coho salmon), it can take one or two days for steelhead and Chinook salmon to display mortality (Fresh et al., 2022). A recent study looked at the sensitivity of early life stage (~ three weeks post swim-up [newly feeding] coho salmon and Chinook salmon) and found that juvenile coho salmon are three orders of magnitude more sensitive to 6PPD-quinone than Chinook salmon (Lo et al., 2023). This study found only 7.1% survival for coho salmon exposed to the lowest concentration treatment group, while Chinook salmon showed 61.4% survival in the highest concentration treatment group (Lo et al. 2023). While not showing the degree of sensitivity to stormwater runoff containing 6PPD-quinone as coho salmon, juvenile steelhead and Chinook do appear to exhibit direct mortality, although at higher concentrations and with longer response times (Tien et al. 2021, Fresh et al. 2022, Lo et al. 2023, and Brinkman et al 2022). The use of bioretention facilities, such as the CSTW/DP facilities proposed for this project, has been found to prevent the acute lethal effects of stormwater on salmonids (Spromberg et al. 2015). Other recent studies have found compost-amended bioswales to be effective at removing a variety of contaminants from runoff, including PAHs and heavy metals (Fardel et al. 2020; McIntyre et al. 2015). Similar to compost-amended bioswales, the CSTW/DP facilities proposed for this project include large amounts of organic matter that can bind or otherwise remove contaminants from the stormwater. As such, CSTW/DP facilities are likely to have a similar degree of effectiveness.

The concentrations of contaminants that remain in stormwater discharged to receiving waters are unknown, and they are expected to be highly variable. Similarly, the distance from the outfall to the point where the contaminants dilute to levels too low to cause detectable effects is also unknown and expected to be highly variable. Runoff volumes vary and depend on the timing, intensity, and duration of individual storm events. Contaminant concentrations are likely to be greatest during first-flush events, after contaminants have accumulated on roadways during long periods of dry weather. Such events are most common in early and mid-autumn.

Another factor is the system that conveys the stormwater to receiving waters. Where water is conveyed in open, vegetated ditches, contaminant concentrations are reduced through infiltration and adsorption to organic matter. Fewer opportunities for such reductions occur in conveyance systems that consist primarily of pipes.

The following subsections evaluate potential project-related changes in contaminant levels in each of the two receiving waters (East Fork Hylebos Creek Tributary 0016A and West Fork Hylebos Creek Tributary 0014C)). As discussed in Section 2.2, under current conditions, ESA-listed fish are neither known nor expected to be present within 1.5 miles of any discharge points from project SWM facilities, and no critical habitat is present in any of those streams. The potential for ESA-listed species and critical habitat farther downstream to be exposed to elevated contaminant levels is addressed in the subsection that follows discussions of impacts on the two streams.

4.2.1.1 East Fork Hylebos Creek Tributary 0016A

Water from all 16 TDAs in this basin will receive treatment and flow control. In seven TDAs, treated water from SWM facilities will discharge to the stream, in seven TDAs treated stormwater from will enter pipes that discharge to the stream channel, in one TDA treated stormwater will have a surface discharge and then enter the stream, and in one TDA, treated stormwater will have a surface discharge only. Overall, treatment is expected to reduce the loading of contaminants in stormwater that is discharged from the project site to East Hylebos Creek Tributary 0016A, compared to current conditions.

The project will add 1.53 acres of PGIS in the East Fork Hylebos Creek Tributary 0016A watershed (Table 4-2). All treated stormwater that enters East Fork Hylebos Creek Tributary 0016A will undergo substantial mixing, dilution, infiltration, and adsorption in the approximately 1.9 miles of stream channel between the project area and waters where ESA-listed fish are known or expected to be present.

4.2.1.2 West Fork Hylebos Creek Tributary 0014C

Water from all 8 TDAs in this basin will receive enhanced treatment and flow control. All treated stormwater will be conveyed via existing or new conveyance facilities to discharge points at the S 336th Street crossing of West Fork Hylebos Creek Tributary 0014C or to the outlet (flow control structure) of the regional stormwater detention/treatment facility located between S 336th Street and SR-99, which is an inline impoundment of West Fork Hylebos Creek Tributary 0014C. Overall, treatment is expected to reduce the loading of contaminants in stormwater that is discharged from the project site to West Hylebos Creek Tributary 0014C, compared to current conditions. In addition to the treatment already provided, stormwater discharged at S 336th Street will receive additional polishing as it passes through the regional stormwater detention/treatment facility.

Overall, there will be a 0.26 acre reduction in PGIS in the West Fork Hylebos Creek Tributary 0014C watershed. Water that leaves the project area will pass through several large wetland complexes and ponded areas before entering any streams where ESA-listed fish are known or expected to be present. Treated water discharged from existing and new SWM facilities (See Figure 1-13) in this watershed will receive additional treatment, detention, and possibly infiltration as it passes through these areas downstream of the project area.

It should be noted that approximately 1.8 acres of the regional stormwater detention/treatment facility mentioned above will be filled to accommodate the proposed extension of 18th Place S. This facility, along with other regional facilities along West Fork Hylebos Creek Tributary 0014C, when combined, are part of a larger effort to reduce downstream flooding. Overall, this facility (also a regulated Category II forested wetland) provides some limited flow control and what water quality treatment provided is incidental, but nevertheless important to maintain or improve water quality conditions in the Hylebos watershed. Compensatory wetland mitigation is anticipated to offset the incidental water quality benefits provided by the facility, and redundant flow control capacity provided throughout the system, in addition to flow control and water quality treatment provided by large natural wetland systems farther downstream, are anticipated to minimize potential adverse impacts to water quality and quantity downstream.

4.2.1.3 Potential for ESA Listed Fish to be Exposed to Contaminants

In the Hylebos Creek basin, the potential for ESA-listed fish to be exposed to harmful levels of contaminants in stormwater runoff will be minimized through the provision of the described stormwater BMPs. In many TDAs, contaminant levels will be further reduced during flow overland and/or through wetlands or other large waterbodies. Given the approximate 6.5 mile distance between the project area stormwater discharges and the Hylebos Waterway, any residual contaminants in runoff from project related PGIS will be diluted to levels too low to detectably degrade water quality.

The following are evaluations of the exposure potential for the various life stages of ESA-listed fish that may be present in streams in the Hylebos Creek watershed.

- Bull trout are not expected to spawn in the Hylebos Creek system. Exposure to runoff from project related PGIS would occur only if individual bull adults or subadults from other systems were to venture or stray into Hylebos Creek. The probability of bull trout presence is anticipated to be extremely low and coupled with extremely small numbers and lack of supporting habitat within the Hylebos Creek drainage basin, the potential for bull trout presence to occur simultaneously with a storm event that discharges large amounts of contaminants to the stream is discountable. In addition, the impacts of any such exposure would likely be insignificant because the visit would be brief and transitory.
- Adult Chinook salmon may be present in the lower watershed in accessible streams from August through December. Accessible stream reaches are more than 2 miles downstream from the discharge points of proposed stormwater treatment facilities. Spawning has been documented in West Fork Hylebos Creek approximately 1.5 miles downstream from the discharge point of the nearest TDA.
- Chinook juveniles may spend up to a year in freshwater habitats of the Hylebos Creek watershed with most juvenile use anticipated in the lower portion of the watershed.
- Adult steelhead may be present in the lower watershed in accessible stream reaches from January through June, with the highest probability of presence occurring during the peak migration period (April and May). Accessible stream reaches are more than 1.8 miles downstream from the discharge points of proposed stormwater treatment facilities. Steelhead may spawn in the Hylebos Creek watershed, albeit in low numbers and probably not every year. Stream reaches most likely to provide spawning habitat are in West Fork Hylebos Creek approximately 2.5 miles downstream from the discharge point of the nearest TDA.
- Juvenile steelhead could be present at any time of year, albeit in low numbers and with low probability. Juvenile steelhead are most likely to rear in lower reaches of the Hylebos Creek watershed.
- Larval bocaccio and yelloweye rockfish could be swept into the lower tidally influenced portion of Hylebos Creek on incoming tides; however, their brief residence time within the tidally influenced portion of the stream limits the potential for exposure to stormwater related contaminants.
- In the future, when access is restored to the tributaries near the project area, they are unlikely to provide suitable spawning habitat for bull trout, Chinook salmon, or steelhead due to unsuitable habitat conditions, such as intermittent flows and a high proportion of fine sediments. These upper tributary streams could support some limited rearing by steelhead following barrier corrections in the watershed.

4.2.2 Changes in Land Use

The OMF South is not likely to affect land use patterns outside of the project site boundary. This conclusion is based on Sound Transit's determination that the major components of the regional light rail system are not likely to induce land use changes that would not otherwise occur. Light rail transit may influence specific aspects of transit-oriented development, but it is not expected to result in development that would not otherwise occur in the context of existing transit- and density-oriented development plans (Sound Transit 2011).

The OMF South would support the operations of FWLE, future planned light rail extensions to the south (TDLE) and other major components of the Link light rail system but would not alter them in any way that is likely to induce land use change. OMF South operations would be discernable from nearby properties but are unlikely to materially affect the nature or timing of land use changes outside of the project site. Therefore, the proposed action is not likely to result in indirect effects, to listed or proposed species or designated or proposed critical habitat, related to changes in land use.

4.2.3 Changes in Prey Species Abundance

Chinook salmon (a primary prey species for SRKW) and coho salmon (a primary prey species for bull trout) could be adversely affected by residual contaminants in stormwater that is discharged from treatment facilities. As discussed above, the potential for substantial adverse effects will be minimal, for the following reasons:

- Runoff from new and replaced PGIS will undergo water quality treatment in accordance with applicable requirements.
- The project will result in a net increase in PGIS within the Hylebos Creek watershed; however, the increase in PGIS can be largely attributed to parking lots and roadways that have low average daily traffic volumes. In addition, the overarching goal of the light rail project is to reduce vehicle use on local roadways by providing efficient and cost effective means of non-vehicular travel. This reduction in roadway traffic, while not quantified, is anticipated to have beneficial effects on pollutant loadings within the Puget Sound region.
- Stream reaches that will receive discharge from stormwater facilities are currently inaccessible to Chinook and coho salmon.
- If all public and private crossing structures that currently impede fish access are removed, the small, fine-substrate-dominated, headwater tributaries in the project area are not expected to provide suitable spawning habitat for Chinook salmon, and they are far enough upstream from suitable spawning areas to be unlikely to provide rearing habitat for Chinook salmon juveniles.
- Substantial infiltration, dilution, and adsorption will occur over the distance between stormwater facility discharge points and waters where critical habitat has been designated, further reducing contaminant levels in treated water that leaves the facilities.

Even if residual contaminants, including 6PPD quinone, in stormwater were to measurably reduce the number of Chinook or coho salmon in the Hylebos Creek system, that number represents a small proportion of the overall populations of these species in Puget Sound. Any such effects would not translate into population-level effects that would measurably reduce the availability of prey species for SRKWs or bull trout. Based on the above, the potential for adverse impacts on the availability of food resources for SRKWs or bull trout is discountable, and the outcome of any such impacts would be insignificant.

If water is present in stream channels where ground-disturbing work occurs, in-water work would have the potential to displace prey species for both Chinook salmon and steelhead. The effects of any such displacement would be localized and temporary, and prey species would be expected to return following construction. Moreover, the stream reaches where in-water work will take place are inaccessible to Chinook salmon and steelhead. Given the availability of prey in adjacent habitats, the proposed action is anticipated to have an insignificant effect on the availability of prey for Chinook salmon and steelhead.

4.2.4 Riparian and Wetland Habitat Impacts

Listed species do not currently occupy instream habitats adjacent to riparian and/or wetland habitats in the project area; therefore, removal of vegetation/alteration of streambed material will have no direct effect on listed species. The only potential is related to the time it takes for vegetation to regrow and the timing of barrier replacements that would allow listed fish access to the project area. Over the long-term, there would be a permanent loss of forested wetlands and forested riparian corridor and the inability of these habitats to become established because of the vegetation clear zone established on either side of the guideway. Vegetation will be re-established along the stream corridor; however, vegetation will be restricted to low-growing tree and shrub species. This change in vegetative structure around the affected portion of streams will likely result in degraded habitat conditions if salmonid access were to be restored. This includes a loss of LWD recruitment to the channel, which will result in reduced channel complexity; loss of organic input into the stream, which can result in reduced food-web interactions, loss of thermal cover, and reduced hyporheic exchange, which can degrade water quality within the project area as well as areas downstream.

Table 4-1 below includes a summary of stream and stream buffer impacts. Overall, there will be approximately 3,050 linear feet of permanent impact to streams in the project area because of stream channel modifications and culvert replacement activities. Where the stream channel conflicts with guideway supports, the stream will be relocated around footings. Approximately 7.2 acres of riparian vegetation will be permanently impacted by guideway construction and conversion of forested riparian habitat to scrub/shrub dominated vegetation.

Table 4-1 Summary of Potential Stream and Stream Buffer Impacts

Project Element	Stream[1]	Permanent Impact (linear feet)[2]	Temporary Impact[3] (linear feet)	Permanent Stream Buffer Impact[4] (acres)	Temporary Stream Buffer Impact (acres)[4]
OMF South Site	East Fork Hylebos Creek Tributary 0016A	900	250	2.8	1.4
	West Fork Hylebos Creek Tributary 0014C[5]	600	50	0.5	2.9
Mainline Track	East Fork Hylebos Creek Tributary 0016A	1,550	250	3.9	2.2
Total		**3,050**	**550**	**7.2**	**6.5**

Notes:

(1) Both affected streams are Type F, per WAC 22216030.

(2) Includes the total length of surface-flowing stream within the permanent impact footprint defined for this analysis.

(3) Includes the total length of surface-flowing stream within the construction-related impact footprint defined for this analysis.

(4) Impact numbers presented in this table represent all affected areas inside functional stream buffers, including areas that overlap with wetland buffers.

(5) The portion of this stream in the study area lacks a defined bed and bank where it flows through Wetland WFW-02. For this reason, stream impacts are based on the approximate centerline of the mapped stream, and buffer impacts are based on the affected area of Wetland WFW02. See text for further discussion.

Table 4-2 below includes a summary of wetland and wetland buffer impacts. Overall, there will be 4.3 acres of permanent wetland impact and approximately 3.2 acres of temporary wetland impact. These impacts are primarily associated with riverine wetlands. Similar to the stream impacts discussed above, these impacts will contribute to reduced habitat complexity, reduced flood storage, and reduced hyporheic exchange in the affected watersheds. This can ultimately result in altered peak/base flows, degraded water quality, and altered vegetative communities.

Table 4-2 Summary of Wetland and Wetland Buffer Impacts (Acres)

Project Element	Wetland Rating[1]	Permanent Wetland Impact	Temporary Wetland Impact	Permanent Wetland Buffer Impact[2]	Temporary Buffer Impact[2]
OMF South Site	Category II	1.8	2.7	7.8	1.7
	Category III	0.90	0.3		
	Category IV	0.00	<0.05		
Mainline Track	Category III	1.6	<0.05	4.7	3.5
	Category IV	<0.10	<0.05		
Total		**4.3**	**3.0-3.1**	**12.5**	**5.2**

Notes:

(1) Wetland ratings (Hruby 2014) are preliminary and subject to review by permitting authorities.

(2) Impact numbers presented in this table represent all affected areas inside functional wetland buffers, including areas that overlap with stream buffers; therefore, this table likely overestimates the extent of buffer impact areas. Stream areas, defined by the OHWL, are excluded from wetland buffer areas.

Sound Transit is currently developing mitigation strategies to compensate for the loss of wetland, stream, and their associated buffers. This will likely include a combination of on-site mitigation, off-site mitigation, and use of fee in lieu programs established in the watershed.

4.2.5 Stream Habitat Enhancement

The culvert replacements described in Section 1.3.2 will facilitate fish access to headwater habitats in East Fork Hylebos Creek Tributary 0016A and West Fork Hylebos Creek Tributary 0014C upstream of the project area. According to the WDFW fish passage site report for culvert 935271 on East Fork Hylebos Creek Tributary 0016A, removal of this barrier has the potential to facilitate access to approximately 2.5 miles of stream channel, including approximately 4,600 square feet of potential spawning habitat and approximately 164,000 square feet of potential rearing habitat. Access to this habitat will be possible only after multiple downstream and upstream barriers to fish passage are removed, however. The WDFW fish passage site report for culvert 933224 on West Fork Hylebos Creek does not identify any habitat gain; however, removal of this barrier has the potential to facilitate access to approximately 3,800 feet of stream channel. Similar to the East Fork Hylebos Creek Tributary 0016A, access to this habitat will be possible only after multiple downstream and upstream barriers to fish passage are removed, however.

The project will remove/replace approximately 890 feet of culverted stream with approximately 520 feet of fish-passable culverts and daylighting of approximately 570 linear feet of channel. By daylighting the stream channel, the project will allow increased interaction between the stream and associated riparian vegetation, restoring natural processes such as organic input and flow attenuation. Even if access to the reaches in and upstream of the project limits is not fully restored, the benefits of these restoration activities will likely translate into improvements in ecological functions in downstream reaches.

4.3 Effects on the Physical and Biological Features of Critical Habitat

The project includes no work in or near any waters that have been designated as critical habitat for any ESA listed species. As such, the project will have no direct effects on the physical or biological components of critical habitat for ESA-listed fish. Analyses in this section address the potential for residual contaminants in stormwater runoff to degrade water quality in waters where critical habitat has been designated for ESA-listed fish.

4.3.1 PBFs for Puget Sound ESU Chinook Salmon and Puget Sound DPS Steelhead

PBFs essential to the conservation of the Puget Sound ESU Chinook salmon and Puget Sound DPS steelhead in freshwater and estuarine habitats are present in the action area, as identified in Section 2.3.2 and Section 2.3.3. Potential project-related effects on each of those PBFs are discussed below. The project will not affect riparian habitat or physical in-stream habitat in or near any waters where critical habitat has been designated for either of these species. As such, the project will have no direct effects on the physical or biological components of freshwater habitats; the discussions below address potential impacts on water quality.

PBF 1 (freshwater spawning sites)

Designated critical habitat in the lower reaches of West Fork Hylebos Creek provides freshwater spawning sites for Chinook salmon and (infrequently) steelhead. Contaminants in runoff from PGIS may degrade water quality for spawning adults and for incubating eggs and fry of both species.

PBF 2 (freshwater rearing sites)

Designated critical habitat in Hylebos Creek, the lower reaches of West Fork Hylebos Creek and East Fork Hylebos Creek provides potential freshwater rearing sites for Chinook salmon. Designated critical habitat in the lower reaches of West Fork Hylebos Creek and East Fork Hylebos Creek provides potential freshwater rearing sites for steelhead. Contaminants in runoff from PGIS may degrade water quality for rearing juveniles of both species in these streams.

PBF 3 (freshwater migration corridors)

Designated critical habitat in Hylebos Creek, the lower reaches of West Fork Hylebos Creek and East Fork Hylebos Creek provides freshwater migration corridors for Chinook salmon. Designated critical habitat in the lower reaches of West Fork Hylebos Creek and East Fork Hylebos Creek provides freshwater migration corridors for steelhead. Contaminants in runoff from PGIS may degrade water quality for adults that migrate through these areas to spawning areas upstream, as well as for outmigrating juveniles.

PBF 4 (estuarine habitats)

The project will have no direct effects on physical or biological components of estuarine habitats that have been designated as critical habitat for Chinook salmon and/or steelhead. As discussed in Section 4.2.1, any residual contaminants in runoff from project-related impervious surfaces will be diluted to levels too low to detectably degrade water quality almost immediately upon entering estuarine or marine waters.

4.4 Effects of Interrelated and Interdependent Actions

Traffic detours and compensatory mitigation activities required for compliance with local critical areas rules are considered interrelated and interdependent actions for this project. None of the detours described in Section 1.3.2 will result in substantial increases in traffic volumes on the affected roads. Noise impacts from detours will not exceed those expected under normal conditions. As such, the detours are not expected to result in impacts that have not already been addressed in this analysis.

Compensatory mitigation actions will not contribute to the noise impacts above the planned project impacts, nor will they expand or degrade the aquatic action area. Therefore, interrelated and interdependent actions will not contribute to project impacts on listed species.

4.5 Cumulative Impacts

Consistent with the requirements specified in 50 CFR 402.02, the analysis of cumulative effects is based on future actions that are (1) reasonably certain to occur in the action area, and (2) not expected to include a federal nexus that would trigger ESA Section 7 compliance requirements.

In the action area, the only reasonably foreseeable future actions that have no federal nexus and that could contribute to increased pollutant loading in waters that support ESA-listed fish consist of urban development projects on private lands. One such project includes a planned 94-unit attached single-family development (Creekside Commons) located on two undeveloped parcels, one immediately north of S 333rd Street and one immediately south of S 333rd Street along West Fork Hylebos Creek Tributary 0014C's riparian corridor. A mitigation plan has been prepared for the project's impacts to the buffers of two adjacent riparian wetlands and the project would also be required to meet current City of Federal stormwater regulations.

The Creekside Commons and any future projects will have to comply with state and local regulations that protect wetlands, streams, and other critical areas. Such reviews will trigger the implementation of mitigation measures and practices aimed at avoiding or minimizing the potential for adverse effects on wetlands, aquatic species and habitat, and other natural resources such as fish and wildlife habitat conservation areas. Compliance with those requirements will ensure that any future development projects in the action area will be unlikely to result in adverse impacts on water quality in waterbodies that support ESA-listed fish.

Based on the above, this project is not expected to contribute to adverse cumulative effects on ESA-listed species when considered in conjunction with other reasonably foreseeable future projects.

5 CONCLUSIONS AND EFFECT DETERMINATIONS

The following subsections present effect determinations and rationales for the ESA-listed species and designated critical habitat. Table 5-1 provides a summary of effect determinations.

Table 5-1 Summary of Effect Determinations for the OMF South Project

Species or Critical Habitat	Effect Determinations
Bull Trout	Not Likely to Adversely Affect
Puget Sound Chinook Salmon	Likely to Adversely Affect
Puget Sound Chinook Salmon Critical Habitat	Likely to Adversely Affect
Puget Sound Steelhead	Likely to Adversely Affect
Puget Sound Steelhead Critical Habitat	Likely to Adversely Affect
Puget Sound/Georgia Strait Bocaccio	Not Likely to Adversely Affect
Puget Sound/Georgia Strait Yelloweye Rockfish	Not Likely to Adversely Affect
Southern Resident Killer Whale	Not Likely to Adversely Affect
Southern Resident Killer Whale Critical Habitat	Not Likely to Adversely Affect

5.1 Bull Trout

The project **may affect** bull trout for the following reasons:

- A single subadult bull trout or Dolly Varden was observed in West Fork Hylebos Creek.
- The project will increase the area of PGIS in areas that drain the headwaters of tributaries to Hylebos Creek.
- The project will remove crossing structures on East Fork Hylebos Creek Tributary 0016A and West Fork Hylebos Creek Tributary 0014C that impede fish passage, improving access to upstream habitat.
- The project will result in the permanent conversion of forested riparian habitat to scrub/shrub dominated habitat.

The project is **not likely to adversely affect** bull trout for the following reasons:

- Stream reaches that will directly receive discharge from stormwater facilities are currently inaccessible to bull trout.
- If all public and private crossing structures that currently impede fish access are removed, the small, fine-substrate-dominated, headwater tributaries in the project area are not expected to provide suitable habitat for bull trout.
- Runoff from new and replaced PGIS will undergo water quality treatment in accordance with applicable requirements.
- Substantial infiltration, dilution, and adsorption will occur over the distance between stormwater facility discharge points and waters where this species might be present, further reducing contaminant levels in treated water that leaves the facilities.

- Bull trout are not expected to spawn in the Hylebos Creek system due to the lack of suitable spawning habitat. Exposure to runoff from project related PGIS would occur only if bull trout adults or subadults from other systems were to venture into these waters. The potential for such a visit to correspond with a storm event that discharges large amounts of contaminants to the stream is discountable. In addition, the impacts of any such exposure would likely be insignificant because the visit would be brief and transitory.
- The potential for delivery of sediment or contaminants during culvert replacement and stream channel construction in East Fork Hylebos Creek Tributary 0016A and West Fork Hylebos Creek Tributary 0014C will be minimized through implementation of the measures specified in Section 1.4.
- The overarching goal of the light rail program is to reduce vehicle use on local roadways by providing efficient and cost effective means of travel for daily commuters and the public. This reduction in roadway traffic cannot be directly attributed to the OMF South project; however, the OMF South project is an integral part of the overall program and is anticipated to have some level of indirect beneficial effects on vehicle related pollutant loadings within the Puget Sound region.

5.2 Puget Sound Chinook Salmon

The project **may affect** Puget Sound Chinook salmon for the following reasons:

- Chinook salmon are present in the Hylebos Creek watershed.
- The proposed action will result in a net increase in PGIS in the Hylebos Creek watershed and will discharge treated stormwater in the headwaters of tributaries to Hylebos Creek.
- Chinook salmon spawn in West Fork Hylebos Creek approximately 1.5 miles downstream of the discharge point from the nearest TDA.
- The project will remove crossing structures on East Fork Hylebos Creek Tributary 0016A and West Fork Hylebos Creek Tributary 0014C that impede fish passage, improving access to upstream habitat.

The project is **likely to adversely affect** Puget Sound Chinook salmon for the following reasons:

- Water discharged from detention and treatment facilities may contain residual concentrations of contaminants that may affect Chinook salmon.

The project will not likely appreciably reduce the survival and recovery of Puget Sound Chinook salmon for the following reasons:

- Stream reaches that will receive direct discharge from stormwater facilities are currently inaccessible to Chinook salmon and any work below the OHWL would occur during the in-water work window when salmon are least likely to occur.
- If all public and private crossing structures that currently impede fish access are removed, the small, fine-substrate-dominated, headwater tributaries in the project area are not expected to provide suitable spawning habitat for Chinook salmon, and they are far enough upstream from suitable spawning areas to be unlikely to provide rearing habitat for juveniles.
- Runoff from new and replaced PGIS will undergo water quality treatment in accordance with applicable requirements.

- Substantial infiltration, dilution, and adsorption will occur over the distance between stormwater facility discharge points and waters where Chinook are currently distributed, further reducing contaminant levels in treated water that leaves the facilities.
- The potential for delivery of sediment or contaminants during construction in East Fork Hylebos Creek Tributary 0016A and West Fork Hylebos Creek Tributary 0014C will be minimized through implementation of the measures specified in Section 1.4.
- The overarching goal of the light rail program is to reduce vehicle use on local roadways by providing efficient and cost effective means of travel for daily commuters and the public. This reduction in roadway traffic cannot be directly attributed to the OMF South project; however, the OMF South project is an integral part of the overall program and is anticipated to have some level of indirect beneficial effects on vehicle related pollutant loadings within the Puget Sound region.

5.3 Puget Sound Chinook Salmon Critical Habitat

The project **may affect** critical habitat for Puget Sound ESU Chinook salmon for the following reasons:

- Designated critical habitat for Puget Sound Chinook salmon is present in the action area.
- The project will discharge treated stormwater to waters designated as critical habitat.

The project is **likely to adversely affect critical** habitat for Puget Sound Chinook salmon for the following reasons:

- Contaminants in runoff from PGIS may degrade water quality in waters that are designated as critical habitat and that support the spawning, rearing, and migration PBFs of critical habitat for Puget Sound Chinook salmon.

5.4 Puget Sound Steelhead

The project **may affect** Puget Sound steelhead for the following reasons:

- Steelhead are present in the Hylebos Creek watershed.
- Steelhead occasionally spawn in West Fork Hylebos Creek approximately 2.5 miles downstream of the discharge point from the nearest TDA.
- The project will result in a net increase in PGIS in the Hylebos Creek watershed and will discharge treated stormwater to headwater tributaries to Hylebos Creek.
- The project will remove crossing structures on East Fork Hylebos Creek Tributary 0016A and West Fork Hylebos Creek Tributary 0014C that impede fish passage, improving access to upstream habitat.

The project is **likely to adversely affect** Puget Sound steelhead for the following reasons:

- Water discharged from detention and treatment facilities may contain residual concentrations of contaminants that may affect steelhead.

The project will not likely appreciably reduce the survival and recovery of Puget Sound steelhead for the following reasons:

- Stream reaches that will receive direct discharge from stormwater facilities are currently inaccessible to steelhead.
- If all public and private crossing structures that currently impede fish access are removed, the small, fine-substrate-dominated, headwater tributaries in the project area are not expected to provide suitable spawning habitat for steelhead. However, this habitat may be used by juvenile steelhead, albeit in low numbers.
- Runoff from new and replaced PGIS will undergo water quality treatment in accordance with applicable requirements.
- Substantial infiltration, dilution, and adsorption will occur over the distance between stormwater facility discharge points and waters where critical habitat has been designated, further reducing contaminant levels in treated water that leaves the facilities.
- The potential for delivery of sediment or contaminants during construction in East Fork Hylebos Creek Tributary 0016A and West Fork Hylebos Creek Tributary 0014C will be minimized through implementation of the measures specified in Section 1.4.
- The overarching goal of the light rail program is to reduce vehicle use on local roadways by providing efficient and cost effective means of travel for daily commuters and the public. This reduction in roadway traffic cannot be directly attributed to the OMF South project; however, the OMF South project is an integral part of the overall program and is anticipated to have some level of indirect beneficial effects on vehicle related pollutant loadings within the Puget Sound region.

5.5 Puget Sound Steelhead Critical Habitat

The project **may affect** critical habitat for Puget Sound steelhead for the following reasons:

- Designated critical habitat for Puget Sound steelhead is present in the action area.
- The project will discharge treated stormwater in areas that ultimately drain to waters designated as critical habitat.

The project is **likely to adversely affect** critical habitat for Puget Sound steelhead for the following reasons:

- Contaminants in runoff from PGIS may degrade water quality in waters that are designated as critical habitat and that support the spawning, rearing, and migration PBFs of critical habitat for Puget Sound steelhead.

5.6 Bocaccio

The project **may affect** Bocaccio for the following reasons:

- Current-borne larvae of bocaccio could be present in the lower tidally influenced portion of Hylebos Creek.
- The project will discharge treated stormwater to headwater tributaries to Hylebos Creek.

The project is **not likely to adversely affect** bocaccio for the following reasons:

- Sub-adults and adults of this species typically occupy waters deeper than 120 feet and are therefore not expected to be present in the lower, tidally influenced reach of Hylebos Creek.
- The project area is located 3 to 5 miles upstream of the lower tidally influenced portion of Hylebos Creek. Given the distance and potential for additional treatment via wetlands and infiltration into groundwater, the effects of stormwater on bocaccio is considered insignificant.
- Larval rockfish are dispersed by currents, making the concentration or probability of the presence of larvae in any one location extremely small. Similarly, the limited number of adult ESA-listed rockfish in Puget Sound further reduces the probability of larval presence and exposure to project activities.
- The overarching goal of the light rail program is to reduce vehicle use on local roadways by providing efficient and cost effective means of travel for daily commuters and the public. This reduction in roadway traffic cannot be directly attributed to the OMF South project; however, the OMF South project is an integral part of the overall program and is anticipated to have some level of indirect beneficial effects on vehicle related pollutant loadings within the Puget Sound region.

5.7 Yelloweye Rockfish

The project **may affect** yelloweye rockfish for the following reasons:

- Larval yelloweye rockfish could be present in the lower tidally influenced portion of Hylebos Creek.
- The project will discharge treated stormwater to headwater tributaries to Hylebos Creek.

The project is **not likely to adversely** affect yelloweye rockfish for the following reasons:

- Sub-adults and adults of this species typically occupy waters deeper than 120 feet and are therefore not expected to be present in the lower, tidally influenced reach of Hylebos Creek.
- The project area is located 3 to 5 miles upstream of the lower tidally influenced portion of Hylebos Creek. Given the distance and potential for additional treatment via wetlands and infiltration into groundwater, the effects of stormwater on yelloweye rockfish is considered insignificant.
- Larval rockfish are dispersed by currents, making the concentration or probability of the presence of larvae in any one location extremely small. Similarly, the limited number of adult ESA-listed rockfish in Puget Sound further reduces the probability of larval presence and exposure to project activities.
- The overarching goal of the light rail program is to reduce vehicle use on local roadways by providing efficient and cost effective means of travel for daily commuters and the public. This reduction in roadway traffic cannot be directly attributed to the OMF South project; however, the OMF South project is an integral part of the overall program and is anticipated to have some level of indirect beneficial effects on vehicle related pollutant loadings within the Puget Sound region.

5.8 Southern Resident Killer Whale

The project **may affect** southern resident killer whales for the following reason:

- The project may adversely affect Chinook salmon, a primary prey source for this species.

The project is **not likely to adversely affect** southern resident killer whales for the following reasons:

- The project will not appreciably reduce the survival and recovery of Chinook salmon and will not, therefore, result in any population-scale reductions in the availability of this prey resource for southern resident killer whales.
- Southern resident killer whales are not known or expected to use habitats in the action area and will not be exposed to any other potential project-related impacts.

5.9 Southern Resident Killer Whale Critical Habitat

The project **may affect** critical habitat for southern resident killer whale for the following reasons:

- Availability of sufficient prey resources is an important PBF of critical habitat for this species.
- The project will discharge treated stormwater in an area that drains to waters that support Chinook salmon—the preferred prey of southern resident killer whales.
- Project-generated pollutants may further degrade water quality, leading to adverse effects on a small number of individual Chinook salmon.

The project is **not likely to adversely affect** critical habitat for southern resident killer whale for the following reason:

- The project will not appreciably reduce the survival and recovery of Chinook salmon and will not, therefore, result in any population-scale reductions in the availability of this prey resource for southern resident killer whales.

APPENDIX A

ESSENTIAL FISH HABITAT ASSESSMENT

Essential Fish Habitat Background

The Magnuson-Stevens Fishery Conservation and Management Act, as amended by the Sustainable Fisheries Act of 1996 (Public Law 104-267), includes a mandate that NMFS must identify essential fish habitat (EFH) for federally managed commercially harvestable fish, and federal agencies must consult with NMFS on all activities, or proposed activities, authorized, funded, or undertaken by the agency that may adversely affect EFH. The Pacific Fishery Management Council has designated EFH for the Pacific Coast salmon fishery, the Pacific Coast groundfish fishery, and the coastal pelagic species fishery.

The objective of this assessment is to determine whether the proposed action may adversely affect designated EFH in the project action area. This assessment also describes conservation measures proposed to avoid, minimize, or otherwise offset potential adverse effects on designated EFH resulting from the proposed action.

The EFH designation for the Pacific Coast salmon fishery includes all streams, lakes, ponds, wetlands, and other water bodies currently or historically accessible to salmon in Washington, Oregon, Idaho, and California, except above the impassable barriers identified by the Pacific Fishery Management Council (PFMC 1999). In estuarine and marine environments, proposed designated EFH extends from near-shore and tidal submerged environments within state territorial waters to the full extent of the exclusive economic zone offshore of Washington, Oregon, and California north of Point Conception (PFMC 1999).

The Pacific Coast salmon management unit includes Chinook, coho, and pink salmon. All three species are known or expected to use habitats in the action area, as summarized below.

Chinook salmon (see Section 2.2.2 of this BA for additional details):

- Documented spawning in the lower reaches of West Fork Hylebos Creek
- Documented presence in Hylebos Creek
- Potential presence (i.e., stream reaches are classified as gradient-accessible) in lower reaches of East Fork Hylebos Creek Tributary 0016A).

Coho salmon:

- Documented spawning in West Fork Hylebos Creek and East Fork Hylebos Creek
- Documented presence in Hylebos Creek and the lower reaches of East Fork Hylebos Creek.
- Potential presence (i.e., stream reaches are classified as gradient-accessible) in West Fork Hylebos Creek Tributary 0014C and East Fork Hylebos Creek Tributary 0016A.

Pink salmon:

- Presumed presence in Hylebos Creek and lower reaches of West Fork Hylebos Creek
- Potential presence (i.e., stream reaches are classified as gradient-accessible) in West Fork Hylebos Creek Tributary 0014C and East Fork Hylebos Creek Tributary 0016A.

In estuarine and marine areas, EFH for all three Pacific Coast salmon fishery species extends from the extreme high tide line in nearshore and tidal submerged environments out to the full extent of the Exclusive Economic Zone offshore. The project action area does not extend into the Hylebos Waterway.

Pacific Coast groundfish EFH is generally defined as the aquatic habitat from the mean higher high water line, plus the upriver extent of saltwater intrusion in river mouths seaward (Casillas et al. 1998). In the action area, this includes lower Hylebos Creek. Pacific Coast groundfish that may potentially occur within the action area during some life history phases include spiny dogfish, California skate, ratfish, lingcod cabezon, kelp greenling, Pacific cod, Pacific whiting (hake), sablefish, bocaccio, brown rockfish, copper rockfish, quillback rockfish, English sole Pacific sanddab, rex sole, and starry flounder.

The Coastal Pelagic Species Fishery Management Plan describes the habitat requirements of five pelagic species: northern anchovy, Pacific sardine, Pacific (chub) mackerel, jack mackerel, and market squid (PFMC 1998). These four finfish and market squid are treated as a single species complex because of similarities in their life histories and habitat requirements. EFH for coastal pelagic species is generally defined as all marine and estuarine waters from the shoreline offshore above the thermocline. EFH for coastal pelagic species does not occur in the project action area.

Description of the Proposed Action

The proposed project is described in detail in Section 1.3 of this BA.

Potential Effects of the Proposed Project

Potential impacts of the proposed action to ESA-listed fish species and habitats are discussed in Section 4 of this BA and are expected to be similar for all federally managed fish species that occur in the action area.

Effects on Essential Fish Habitat for Pacific Coast Salmon

If water is present in East Fork Hylebos Creek Tributary 0016A or West Fork Hylebos Creek Tributary 0014C when project construction is underway, ground-disturbing work in and near the stream channel has the potential to introduce sediment to stream reaches in and immediately downstream (i.e., within 100 feet) of the project limits. In addition, the proposed action includes clearing of riparian vegetation and long term change to cover types as a result of the need to maintain lower growing vegetation where the guideway is in proximity to the stream channel and associated riparian zone. Both the temporary and permanent removal of vegetation can have short- and long-term impacts on water temperatures, large woody debris recruitment to the channel and associated loss of channel complexity and instream cover. Such impacts may adversely affect Pacific salmon EFH and its ability to support spawning and rearing life stages of Pacific salmon. Sedimentation may also negatively impact the prey base of benthic invertebrates. However, project impacts are expected to be very minor for the following reasons:

- Construction-related disturbance of sediments will be minimized by adherence to a TESC plan and installation and monitoring of appropriate erosion control BMPs during construction, limiting earthwork to only those areas necessary to complete that phase of construction, stabilization of disturbed soils shortly after work is completed, and adhering to approved in-water work windows. These effects are anticipated to be short in duration and are not expected to persist following construction.
- Reaches of East Fork Hylebos Creek Tributary 0016A and West Fork Hylebos Creek Tributary 0014C in and within 1 mile of the project limits are currently inaccessible to all anadromous salmonids. As such, temporary increases in sedimentation or turbidity have no potential to affect Chinook, coho, or pink salmon. Restoration of access to these stream

reaches is not expected to be accomplished for many years, long after temporary, construction-related increases in sedimentation or turbidity have disappeared.

As discussed in Section 4.1.1 of this BA, contaminants in stormwater runoff discharged to streams in and near the project limits may degrade water quality in streams that provide EFH for Pacific salmon. Contaminants in stormwater runoff that enters streams in and near the project limits may persist at levels capable of degrading water quality until it is fully diluted in marine waters. If the contaminants are present at levels that have toxic effects on these species, this will constitute an adverse effect on EFH. Potential adverse effects associated with contaminants in stormwater runoff will be minimized by directing runoff to treatment facilities.

In addition to meeting any Washington State and Federal mitigation requirements, unavoidable impacts to streams and associated buffers will be mitigated by using guidance in Federal Way City Code (FWCC) 19.145.430. Ongoing restoration projects in the Hylebos watershed, the King County in-lieu fee program, and the development of a project-specific mitigation site are possible opportunities for mitigation that will comply with all federal, state, and local requirements.

Beneficial effects on Pacific Salmon EFH will be achieved by restoring access to potential stream habitat. The project will remove/replace approximately 890 feet of culverted stream with approximately 520 feet of fish-passable culverts and daylight approximately 570 linear feet of channel. By daylighting almost 570 linear feet of stream channel, the project will allow increased interaction between the stream and associated riparian vegetation, restoring natural processes such as organic input and flow attenuation. Even if access to the reaches in and upstream of the project limits is not fully restored, the benefits of these restoration activities will likely translate into improvements in ecological functions in downstream reaches. According to the WDFW fish passage database, removal of these barriers has the potential to facilitate access to approximately 2.5 miles of stream channel, including approximately 4,600 square feet of potential spawning habitat and approximately 163,850 square feet of potential rearing habitat.

Effects on Essential Fish Habitat for Groundfish

Contaminants in stormwater runoff that enters streams in and near the project limits may persist at levels capable of degrading water quality in lower Hylebos Creek. If the contaminants are present at levels that have toxic effects on groundfish species, this will constitute an adverse effect.

Effects on Essential Fish Habitat for Coastal Pelagic Species

EFH for coastal pelagic species does not extend into the action area. Any potential adverse effects on coastal pelagic species’ EFH due to degraded water quality from the project area are assumed to be negligible by the time runoff reaches marine and estuarine waters.

Essential Fish Habitat Conservation Measures

Conservation measures and BMPs are included for project activities and are described in Section 1.4 (Performance Standards and Impact Avoidance and Minimization Measures) of this BA. In addition, the project includes habitat access improvement measures that will have beneficial effects on EFH for Pacific Coast salmon in freshwater habitats once downstream fish-passage barriers have been corrected.

Conclusions

EFH for Pacific Coast salmon is present in the action area. Contaminants in effluent from stormwater facilities that discharge to streams in and near the project limits may pose adverse effects on EFH for this species group.

Based on the anticipated presence of contaminants in stormwater runoff discharged to receiving waters, combined with the possibility that those contaminants may persist at levels capable of degrading water quality as far downstream as the mouth of Hylebos Creek, the proposed action **may adversely affect** EFH for Pacific Coast salmon and Pacific Coast groundfish. The project **will not adversely affect** EFH for coastal pelagic species.

PRE-BA MEETING NOTES

Meeting Agenda

OMF South – Pre-BA Meeting Summary - DRAFT

August 24, 2023, 2:30 to 4 pm
Teams

Meeting objective(s):

Sound Transit will provide an overview of the proposed Operations and Maintenance Facility (OMF) South project, describe potential impacts for the Preferred Alternative to Endangered Species Act-listed species, and receive preliminary feedback on approach to Biological Assessment (BA)

Participants

Phyllis Meyers, NMFS	Curvie Hawkins, Sound Transit
Bonnie Shorin, NMFS	Erin Green, Sound Transit
Joshua Emery, USFWS	Teresa Vanderburg, Sound Transit
Justin Zweifel, FTA	Becki Kniveton, Sound Transit
Chris Moelter, FTA/Anchor	Brooke O’Neill, Sound Transit
	Steve Krueger, Parametrix
	Pablo Lopez-Hilfiker, HDR Engineers

Meeting Summary

Introductions: see participants above.

Project Overview

- Currently the Operations and Maintenance Facility (OMF) South project is in the environmental review process. FTA is the lead federal agency.
- FTA and Sound Transit are studying three alternatives in the Environmental Impact Statement (EIS): South 336th Street (Preferred) Alternative, South 344th Street Alternative, and Midway Landfill Alternative.
- The Preferred and the South 344th Street alternatives would require about a mile and half of track to connect to the existing light rail system.
- The Preferred Alternative and the South 344th Street alternatives are in the upper part of the Hylebos basin. The Midway Landfill Alternative is in the McSorley Creek Basin that drains to the Puget Sound.

Preferred Alternative Overview

- The Preferred Alternative site includes three primary buildings: an OMF building, maintenance of way building, and Link system wide storage building. The site includes storage tracks on the north side for storage of about 144 light rail vehicles.
- The Preferred Alternative includes about 1.4 miles of mainline track (northbound and southbound) that connect the OMF South site to the rest of the system. A third track (test track) runs parallel to the mainline extension that will be used for testing and commissioning light rail vehicles.
- The mainline track runs on an elevated guideway with heights between 12-30 feet above the ground. Phyllis asked if there would be an opportunity to replant shrubs and shorter trees in areas under the guideway. Depending on the guideway height and location, short stature trees and lower growing shrubs/ground cover can be planted below the guideway in critical areas and buffers. The area around columns needs to remain clear for inspection.
- The project includes culvert replacements on the northwest, northeast, and southern portion of the project site. The culvert replacements will be upgraded to fish passable structures. The OMF South project is currently designed to manage stormwater from all of the impervious surfaces.

- Project will include off site wetland mitigation. The location has not been solidified but will be somewhere in the Hylebos basin.

Environmental Review and Project Schedule

- FTA (the lead federal agency) and Sound Transit are currently planning to publish a NEPA Draft / SEPA Supplemental Draft EIS in September. The Final EIS is anticipated to be published in mid-2024 followed by the Sound Transit's Board action to select the project to build and FTA's Record of Decision.
- The project will be constructed under a design build contract. Operation of the facility is anticipated in 2032 for the Preferred or South 344th Street Alternatives. However, Sound Transit is identifying measures to open the facility as early as 2029. The Midway Landfill alternative would open later due to the complexities of constructing on the landfill.

Affects Analysis and Preliminary Effects Determination for Preferred Alternative

- Steve noted that there is no suitable habitat for federally listed terrestrial species in the project area.
- The project is in the Hylebos watershed, WRIA 10. There are two headwater tributaries: West Fork Hylebos Creek Tributary 0014C and East Fork of Hylebos Creek Tributary 0016A. Both are intermittent, seasonal streams.
- The entirety of West Fork Hylebos Creek Tributary 0014C in the project area flows through a regional water detention facility (in-line detention facility) that is also a wetland. There is no defined channel within the detention facility/wetland. The stream exits the detention facility/wetland via a flow control structure (standpipe) where it continues off-site (piped) beneath SR-99 for approximately 960 feet. T The entire reach within the study area has been modified for flood control.
- The terrestrial action area includes the construction footprint and extent of project related noise.
- The aquatic portion of the action area includes the upstream extent of East and West Fork Tributaries to account for the proposed culvert replacement/removals and resulting improved access to upstream habitat. The aquatic portion of the action area also extends downstream to where Hylebos Creek enters the Hylebos Waterway. These areas may be subject to degraded water quality because of construction and operation of the OMF South project.
- Overall, there is a net reduction in PGIS. All new/replaced PGIS will receive enhanced treatment. The analysis assumes that the light rail guideway as NPGIS per the 2019 Memorandum of Understanding with Ecology. Becki noted that the guideway is used by electric vehicles with non-petroleum lubricants. Ecology recently published its Draft 2024 Stormwater Management Manual for Western Washington that has identified light rail as pollution generating. Sound Transit is in the middle of a water quality characterization study in cooperation with Ecology about stormwater runoff. The study is anticipated in early 2024. At this time, Sound Transit continues to consider the guideway non-pollution generating as they await results from the characterization study.
- Steve provided a fish use summary (see slides 20-21). Documented steelhead is 1.5 miles downstream of the project footprint in the West Fork and 1.9 miles downstream of the project footprint for the East Fork. Chinook distribution is similar in the West Fork and in the East Fork Chinook distribution is approximately 2.7 miles downstream of the project footprint. There are multiple "complete" barriers downstream of the project consisting of long culverts with excessive water surface drops and slopes.
- Steve summarized the effects recommendations (see slides 25-26).
- Bonnie made an observation that when considering downstream effects from stormwater, you might want to change the effect determination for Bocaccio and yelloweye rockfish from No Effect to May Affect, Not Likely to Adversely Affect. This is because the measure of take is at the scale of the individual. If there is potential to affect any individual or any features of critical habitat, even if it is insignificant or discountable, that should be a May Affect determination. Steve described that an outcome of the pre-BA meeting for the adjacent City Center Access was a No Effect for these species. Bonnie stated that No Effect determinations should not be submitted to the Services because the metric for a consultation is a May Affect determination.

- Josh noted that if any fish handling is proposed in the lower reaches of Hylebos Creek for the mitigation site, then USFWS may not support the proposed May Affect, Not Likely to Adversely Affect determination for bull trout. Steve explained that the off-site mitigation area has not been selected at this time. Teresa clarified that Sound Transit is coordinating with the Corps to define mitigation and that it will be primarily wetland mitigation. Permanent stream impacts are for realignment and no linear foot reduction in streams is anticipated. The mitigation is to satisfy city and Corps requirements for permanent wetland impacts. The mitigation will likely have beneficial effects for listed species.
- Justin asked if the Services need to concur with the species list. Josh stated that it is up to the action agency to disclose effects to listed species; however, if during formal consultation the Services determine that there is an adverse effect to species that have not been consulted on then that will tie things up. At this time, the Services don't see anything missing in ST's pre-biological assessment shown on the PowerPoint, or other species that should have been addressed.
- Bonnie stated that, in the context of stormwater, it is not out of the ordinary for NMFS to review a project's stormwater analysis and come out with a May Affect determination on Southern Resident Killer Whale (SRKW) Critical Habitat. NMFS may conclude that SRKW Critical Habitat is affected if Chinook, SRKW preferred prey, may be affected over the anticipated life of a project since sufficient quantity, quality and availability of prey species is a primary constituent element for SRKW.
- The group did not identify concerns with the essential fish habitat recommendation.

Discussion

- FTA will be the lead federal agency. FTA/ST are planning to submit/begin consultation in December with completion of consultation in May 2024.
- Bonnie described that if the Services conduct consultation with FTA, the Corps will rely on that consultation for its permits based on the concept of late arriving action agency. There is an informal understanding that if an agency has funding involved then they lead for consultation. The BA should include text that would identify the Corps as the Section 404 permitting agency.
- The Corps project manager is Colin Greenan. ST just completed a second pre-app meeting in July.
- Teresa discussed project schedule, noting submittal of the BA later in 2023. Joshua indicated that even 10 months for consultation would be challenging.
- ST and NMFS have a staffing agreement where ST is funding Phyllis's position at NMFS to prioritize consultation on ST projects. Bonnie indicated that NMFS consultation will be more in line with the statutory review time of 145 days due to this agreement. Bonnie noted that NMFS has an interagency agreement between NMFS and USFWS that allows NMFS staff to be loaned to USFWS to work on ESA consultations. It would be ideal if Phyllis could cover consultation for both NMFS and USFWS. Joshua will follow up within USFWS on how this will be administrated.

Subject: List of threatened and endangered species that may occur in your proposed project location or may be affected by your proposed project

To Whom It May Concern:

The enclosed species list identifies threatened, endangered, proposed and candidate species, as well as proposed and final designated critical habitat, that may occur within the boundary of your proposed project and/or may be affected by your proposed project. The species list fulfills the requirements of the U.S. Fish and Wildlife Service (Service) under section 7(c) of the Endangered Species Act (Act) of 1973, as amended (16 U.S.C. 1531 *et seq.*).

New information based on updated surveys, changes in the abundance and distribution of species, changed habitat conditions, or other factors could change this list. Please feel free to contact us if you need more current information or assistance regarding the potential impacts to federally proposed, listed, and candidate species and federally designated and proposed critical habitat. Please note that under 50 CFR 402.12(e) of the regulations implementing section 7 of the Act, the accuracy of this species list should be verified after 90 days. This verification can be completed formally or informally as desired. The Service recommends that verification be completed by visiting the IPaC website at regular intervals during project planning and implementation for updates to species lists and information. An updated list may be requested through the IPaC system by completing the same process used to receive the enclosed list.

The purpose of the Act is to provide a means whereby threatened and endangered species and the ecosystems upon which they depend may be conserved. Under sections 7(a)(1) and 7(a)(2) of the Act and its implementing regulations (50 CFR 402 *et seq.*), Federal agencies are required to utilize their authorities to carry out programs for the conservation of threatened and endangered species and to determine whether projects may affect threatened and endangered species and/or designated critical habitat.

A Biological Assessment is required for construction projects (or other undertakings having similar physical impacts) that are major Federal actions significantly affecting the quality of the human environment as defined in the National Environmental Policy Act (42 U.S.C. 4332(2) (c)). For projects other than major construction activities, the Service suggests that a biological evaluation similar to a Biological Assessment be prepared to determine whether the project may affect listed or proposed species and/or designated or proposed critical habitat. Recommended contents of a Biological Assessment are described at 50 CFR 402.12.

If a Federal agency determines, based on the Biological Assessment or biological evaluation, that listed species and/or designated critical habitat may be affected by the proposed project, the agency is required to consult with the Service pursuant to 50 CFR 402. In addition, the Service recommends that candidate species, proposed species and proposed critical habitat be addressed within the consultation. More information on the regulations and procedures for section 7 consultation, including the role of permit or license applicants, can be found in the "Endangered Species Consultation Handbook" at:

https://www.fws.gov/sites/default/files/documents/endangered-species-consultation-handbook.pdf

Migratory Birds: In addition to responsibilities to protect threatened and endangered species under the Endangered Species Act (ESA), there are additional responsibilities under the Migratory Bird Treaty Act (MBTA) and the Bald and Golden Eagle Protection Act (BGEPA) to protect native birds from project-related impacts. Any activity, intentional or unintentional, resulting in take of migratory birds, including eagles, is prohibited unless otherwise permitted by the U.S. Fish and Wildlife Service (50 C.F.R. Sec. 10.12 and 16 U.S.C. Sec. 668(a)). For more information regarding these Acts, see https://www.fws.gov/program/migratory-bird-permit/what-we-do.

The MBTA has no provision for allowing take of migratory birds that may be unintentionally killed or injured by otherwise lawful activities. It is the responsibility of the project proponent to comply with these Acts by identifying potential impacts to migratory birds and eagles within applicable NEPA documents (when there is a federal nexus) or a Bird/Eagle Conservation Plan (when there is no federal nexus). Proponents should implement conservation measures to avoid or minimize the production of project-related stressors or minimize the exposure of birds and their resources to the project-related stressors. For more information on avian stressors and recommended conservation measures, see https://www.fws.gov/library/collections/threats-birds.

In addition to MBTA and BGEPA, Executive Order 13186: *Responsibilities of Federal Agencies to Protect Migratory Birds*, obligates all Federal agencies that engage in or authorize activities that might affect migratory birds, to minimize those effects and encourage conservation measures that will improve bird populations. Executive Order 13186 provides for the protection of both migratory birds and migratory bird habitat. For information regarding the implementation of Executive Order 13186, please visit https://www.fws.gov/partner/council-conservation-migratory-birds.

We appreciate your concern for threatened and endangered species. The Service encourages Federal agencies to include conservation of threatened and endangered species into their project planning to further the purposes of the Act. Please include the Consultation Code in the header of this letter with any request for consultation or correspondence about your project that you submit to our office.

Attachment(s):

- Official Species List

OFFICIAL SPECIES LIST

This list is provided pursuant to Section 7 of the Endangered Species Act, and fulfills the requirement for Federal agencies to "request of the Secretary of the Interior information whether any species which is listed or proposed to be listed may be present in the area of a proposed action".

This species list is provided by:

Washington Fish And Wildlife Office

PROJECT SUMMARY

Project Code:	2023-0047264
Project Name:	Operations and Maintenance Facility South
Project Type:	Railroad - New Construction
Project Description:	The purpose of the Central Puget Sound Regional Transit Authority (Sound Transit) Operations and Maintenance Facility South (OMF South) project is to construct an operations and maintenance facility (OMF) in the South Corridor to support Sound Transit's Link light rail system expansion. This expansion and the related increase in the light rail vehicle (LRV) fleet and daily operations is identified in Sound Transit 3: The Regional Transit System Plan for Central Puget Sound (Sound Transit 3). OMF South would: - Provide a facility with the capacity to receive, test, commission, store, maintain, and deploy vehicles to support the intended level of service for the system-wide light rail system expansion. - Support efficient and reliable light rail service that minimizes system operating costs. - Support and connect efficiently to the regional system and be technically and financially feasible to build, operate, and maintain, consistent with the Sound Transit 3 Plan and Sound Transit's Regional Transit Long-Range Plan. - Preserve and promote a healthy and sustainable environment by minimizing adverse impacts to people and the natural and built environments. Project elements would include: construction of over a mile of elevated track and guideway between the terminus of the Federal Way Light Rail Extension in Federal Way, Washington (currently under construction) and the proposed OMFS between 336th Street South and 344th Street South; construction of the operations and maintenance facility, test tracks, stormwater management facilities, culvert replacements, stream channel modifications, compensatory mitigation, and clearing, grading and fill necessary to accommodate the abovementioned actions.

Project Location:

The approximate location of the project can be viewed in Google Maps: https://www.google.com/maps/@47.304488649999996,-122.30251289530742,14z

ENDANGERED SPECIES ACT SPECIES

There is a total of 8 threatened, endangered, or candidate species on this species list.

Species on this list should be considered in an effects analysis for your project and could include species that exist in another geographic area. For example, certain fish may appear on the species list because a project could affect downstream species.

IPaC does not display listed species or critical habitats under the sole jurisdiction of NOAA Fisheries[1], as USFWS does not have the authority to speak on behalf of NOAA and the Department of Commerce.

See the "Critical habitats" section below for those critical habitats that lie wholly or partially within your project area under this office's jurisdiction. Please contact the designated FWS office if you have questions.

---

1. NOAA Fisheries, also known as the National Marine Fisheries Service (NMFS), is an office of the National Oceanic and Atmospheric Administration within the Department of Commerce.

MAMMALS

NAME	STATUS
North American Wolverine *Gulo gulo luscus* No critical habitat has been designated for this species. Species profile: https://ecos.fws.gov/ecp/species/5123	Proposed Threatened

BIRDS

NAME	STATUS
Marbled Murrelet *Brachyramphus marmoratus* Population: U.S.A. (CA, OR, WA) There is **final** critical habitat for this species. Your location does not overlap the critical habitat. Species profile: https://ecos.fws.gov/ecp/species/4467	Threatened
Streaked Horned Lark *Eremophila alpestris strigata* There is **final** critical habitat for this species. Your location does not overlap the critical habitat. Species profile: https://ecos.fws.gov/ecp/species/7268	Threatened
Yellow-billed Cuckoo *Coccyzus americanus* Population: Western U.S. DPS There is **final** critical habitat for this species. Your location does not overlap the critical habitat. Species profile: https://ecos.fws.gov/ecp/species/3911	Threatened

REPTILES

NAME	STATUS
Northwestern Pond Turtle *Actinemys marmorata* No critical habitat has been designated for this species. Species profile: https://ecos.fws.gov/ecp/species/1111	Proposed Threatened

FISHES

NAME	STATUS
Bull Trout *Salvelinus confluentus* Population: U.S.A., conterminous, lower 48 states There is **final** critical habitat for this species. Your location does not overlap the critical habitat. Species profile: https://ecos.fws.gov/ecp/species/8212	Threatened

INSECTS

NAME	STATUS
Monarch Butterfly *Danaus plexippus* No critical habitat has been designated for this species. Species profile: https://ecos.fws.gov/ecp/species/9743	Candidate
Taylor's (=whulge) Checkerspot *Euphydryas editha taylori* There is **final** critical habitat for this species. Your location does not overlap the critical habitat. Species profile: https://ecos.fws.gov/ecp/species/5907	Endangered

CRITICAL HABITATS

THERE ARE NO CRITICAL HABITATS WITHIN YOUR PROJECT AREA UNDER THIS OFFICE'S JURISDICTION.

YOU ARE STILL REQUIRED TO DETERMINE IF YOUR PROJECT(S) MAY HAVE EFFECTS ON ALL ABOVE LISTED SPECIES.

June 2024

Appendix J: Environmental Mitigation Plan

This appendix lists the environmental mitigation commitments identified in the Final Environmental Impact Statement (EIS) that would be implemented to mitigate the impacts of the Preferred Alternative identified in the Final EIS. Many of the potential impacts identified through the EIS process will be mitigated through incorporation of avoidance, minimization, or improvement elements that are now included in the definition and design of the project. If the Sound Transit Board ultimately selects another alternative to build differing from the Preferred Alternative, the mitigation plan will be modified accordingly.

Table J-1 describes the mitigation measures associated with the operating (long-term) impacts of OMF South first, then the measures associated with construction. The final mitigation measures will be included as conditions of the Federal Transit Administration's (FTA) Record of Decision (ROD) for the project. FTA will incorporate them in any future grant agreement that FTA may award Sound Transit for construction of OMF South. Sound Transit will track these measures and report regularly to FTA to ensure that the mitigation commitments are being met. Where appropriate, Sound Transit will incorporate mitigation requirements into its contracting documents for final design and construction.

The commitments described in Table J-1 are based on those listed in the Final EIS for the Preferred Alternative. After the Sound Transit Board selects the project to be built, and as the project moves into final design, these measures may be revised, and additional measures or design features may be identified and added to the ROD to address project impacts associated with operations or construction. As additional measures are identified or revised during the final design of the project, FTA would review such measures to ensure that they are consistent with previously awarded federal grants.

Some of the environmental mitigation commitments listed in Table J-1 would require coordination with other parties, such as state and federal agencies or local jurisdictions, as part of the project's permitting or approvals process. These outside agencies and jurisdictions may request additional or other measures than those proposed in the EIS, which would require further coordination.

Measures to avoid potential impacts to the environment would continue to be identified as the project advances to final design. Measures to minimize potential impacts, such as best management practices (BMPs) or other protocols that are typically included in the project during construction, are already documented and included in Sound Transit's general construction specifications and conditions.

For the purposes of identifying environmental mitigation commitments, mitigation is generally required when an environmental impact or effect is determined to be significant and adverse. Measures to avoid or minimize project effects are already part of Sound Transit's established policies, design criteria standards, or procedures, and general construction specifications. These measures would automatically be included as part of the project. Mitigation commitments identified in this Environmental Mitigation Plan will be monitored, implemented, and periodically reported to the lead environmental officials.

Table J-1 Mitigation Plan

Resource	Final EIS Chapter/ Section	Impact Topic	Period	Mitigation/Avoidance Description
Transportation	3.2	Arterial and Street Operations	Long-Term	No mitigation required.
			Construction	A construction transportation management plan would be implemented to address site access, traffic control, hauling routes, impacts to transit, construction employee parking, impacts to local businesses, and pedestrian and bicycle control. This plan would be developed in coordination with Federal Way and Washington State Department of Transportation (WSDOT).
		Freight Mobility	Long-Term	No mitigation required.
			Construction	No mitigation required.
		Transit	Long-Term	No mitigation required.
			Construction	Transit service modifications would be coordinated with King County Metro to minimize construction impacts and disruptions to bus facilities and service. This could include posting informational signage before construction at existing transit stops that would be affected by construction activities. Prior to closing a portion of the Federal Way/S 320th Street Park & Ride for construction, Sound Transit would work with King County Metro and WSDOT to determine its utilization rates and that of the nearby Federal Way Downtown Station. If the lots are at or near capacity, Sound Transit would implement alternative measures, such as routing transit riders that use these locations to available spaces at nearby park-and-ride lots, such as the Star Lake Park & Ride, or leasing parking lots or new parking areas within the vicinity of the temporarily closed lot.
		Nonmotorized Facilities	Long-Term	No mitigation required.
			Construction	No mitigation required.
		Parking	Long-Term	No mitigation required.
			Construction	No mitigation required.
		Safety	Long-Term	No mitigation required.
			Construction	No mitigation required.

Table J-1 Mitigation Plan (continued)

Resource	Final EIS Chapter/ Section	Impact Topic	Period	Mitigation/Avoidance Description
Acquisitions, Displacements, and Relocations	3.3	Displacements	Long-Term	Sound Transit would compensate affected property owners that are displaced by the project. This compensation would comply with Sound Transit's Real Property Acquisitions and Relocation Policy, Procedures, and Guidelines; the federal Uniform Relocation Assistance and Real Property Acquisition Policies Act of 1970 (the "Uniform Act"); and the State of Washington's relocation and property acquisition laws and regulations, including Revised Code of Washington (RCW) 8.26 and Washington Administrative Code (WAC) 468-100. In addition to compensating property owners for property rights, other forms of compensation, including moving expenses, replacement housing payments, nonresidential reestablishment, and other eligible expenses, could be provided. Sound Transit would consult with WSDOT staff to develop appropriate site-specific measures and off-site mitigation, agreed to by WSDOT and the Federal Highway Administration (FHWA), that would meet the intended function of the original Resource Conservation Areas (RCAs).
			Construction	No mitigation required.
Land Use	3.4	Land Use	Long-Term	No mitigation required.
			Construction	No mitigation required.
Economics	3.5	Local Businesses	Long-Term	No mitigation required.
			Construction	During construction Sound Transit would develop measures to address the potential impacts to local businesses, these measures could include: • Providing a 24-hour construction telephone hotline. • Establishing effective communications with the public through measures such as meetings and construction updates, alerts, and published schedules. • Providing an ombudsman consistent with Sound Transit policy. • Providing detour, open-for-business, and other signage as appropriate. • Maintaining access as much as possible to each business and coordinating in advance with businesses during times of limited access.
Environmental Justice, Social Resources, Community Facilities, and Neighborhoods	3.6	Social	Long-Term	Mitigation would include that identified for Transportation, Acquisition, Displacements and Relocations, Visual and Aesthetic Resources, and Noise and Vibration.
			Construction	No mitigation required.

Table J-1 Mitigation Plan (continued)

Resource	Final EIS Chapter/ Section	Impact Topic	Period	Mitigation/Avoidance Description
Visual and Aesthetic Resources	3.7	Visual	Long-Term	In addition to design criteria for the final project, specific environmental mitigation commitments will be implemented to reduce long-term visual impacts of the project. These include the following: • **Mitigation Measure 1:** In areas adjacent to residents where there is adequate space, add on-site landscaping adjacent to residential areas to help screen views of project components while ensuring safety and security of residents. • **Mitigation Measure 2**: In areas adjacent to residences where not enough room exists for landscaping to screen views of retaining or noise walls, or in addition to landscaping under Mitigation Measure 1, Sound Transit would treat the walls with visually interesting elements, such as design treatments that incorporate textures, patterns, color, or climbing vines. • **Mitigation Measure 3:** Within the WSDOT right-of-way, Sound Transit would consult with WSDOT to develop appropriate site-specific measures for roadside vegetated areas and mitigate the conversion of these areas to right-of-way with replacement property or with other measures agreed to by WSDOT and FHWA, consistent with the WSDOT Roadside Policy Manual (WSDOT 2022). The manual describes the extent of mitigation that would be required for lost vegetation, vegetation types, and tree replacement ratios, including irrigation requirements and plant establishment criteria. Sound Transit would refine the environmental mitigation commitments as the project design is further developed and feedback from reviewing agencies and the public is received. Environmental mitigation commitments would be compatible with Sound Transit's maintenance and operations requirements, which include long-term maintenance, safety, and security consideration.
			Construction	Where practicable, Sound Transit would place construction screens and/or barriers to limit the visibility of work areas when adjacent to visually sensitive receivers.
Air Quality and Greenhouse Gas Emissions	3.8	Air Quality	Long-Term	No mitigation required.
			Construction	No mitigation required.

Table J-1 Mitigation Plan (continued)

Resource	Final EIS Chapter/ Section	Impact Topic	Period	Mitigation/Avoidance Description
Noise and Vibration	3.9	Light rail noise	Long-Term	When noise would exceed Federal Transit Administration (FTA) moderate or severe impact criteria, Sound Transit would provide noise environmental mitigation commitments consistent with its Link Light Rail Noise and Vibration Policy (Resolution No. R2023-15) and FTA's 2018 Transit Noise and Vibration Impact Assessment Manual. During final design, an updated Noise and Vibration analysis will be prepared to confirm impacts during operations, incorporating any design changes. All predicted noise levels and environmental mitigation commitments will be reviewed, and mitigation would be modified as needed to reduce noise levels to below the FTA impact criteria. If equivalent mitigation could be achieved by a less costly means or if the final design analysis shows no impact, then the mitigation measure may be modified or eliminated. After light rail operations begin, if the resulting noise were to exceed FTA criteria, Sound Transit would evaluate the need for additional mitigation.
		Vibration and ground borne noise	Long-Term	No mitigation required.
		Traffic Noise	Long-Term	Sound Transit will provide traffic noise mitigation measures where traffic noise levels are predicted to be above the 2042 No-Build levels from removal of the existing WSDOT berm and noise wall. Mitigation would be designed to maintain 2042 No-Build noise levels and could include replacement of noise walls and berms. Sound Transit would conduct additional noise analysis during final design in coordination with WSDOT to confirm whether noise mitigation is needed.
		Construction noise and vibration	Construction	Sound Transit will require a detailed Noise and Vibration control plan from the contractor as part of construction.

Table J-1 Mitigation Plan (continued)

Resource	Final EIS Chapter/ Section	Impact Topic	Period	Mitigation/Avoidance Description
Ecosystem Resources	3.10	Ecosystems	Long-Term	For unavoidable long-term impacts on streams and stream buffers, Sound Transit would develop a compensatory mitigation plan during the permitting phase in accordance with applicable federal, state, and local requirements and guidelines. Impacts on streams would be mitigated through restoration actions developed in collaboration with federal, state, local, and Tribal biologists. For unavoidable long-term impacts on wetlands and wetland buffers, Sound Transit would develop a compensatory mitigation plan in accordance with applicable federal, state, and local requirements and guidelines. Sound Transit could use a combination of mitigation strategies to achieve no net loss of wetland function and area, such as off-site compensatory mitigation within the Hylebos Creek watershed, use of King County's in-lieu fee program, use of wetland mitigation banks, and/or other mitigation measures.
			Construction	On-site restoration would be undertaken to offset temporary construction impacts. Examples of such restoration activities include restoring in-stream habitat with large woody debris and planting temporarily disturbed wetlands and riparian buffers with native species. Compensatory mitigation would be provided for construction impacts that last for more than one growing season and for permanent conversion of wetlands from one vegetation type to another (e.g., forested wetland to emergent or scrub-shrub wetland) as well as for indirect impacts on wetlands.
Water Resources	3.11	Water Resources	Long-Term	No mitigation is required. Mitigation related to stream and wetland impacts are described under Ecosystems Resources.
			Construction	Best management practices (BMPs) would be utilized to protect water quality during construction. No mitigation required. Mitigation related to stream and wetland impacts is described under Ecosystems Resources.
Geology and Soils	3.12	Geology and Soils	Long-Term	No mitigation required.
			Construction	No mitigation required.
Hazardous Materials	3.13	Hazardous Materials sites	Long-Term	No mitigation required.
			Construction	No mitigation required.
Public Services	3.14	Public Services	Long-Term	No mitigation required.
			Construction	No mitigation required.

Table J-1 Mitigation Plan (continued)

Resource	Final EIS Chapter/ Section	Impact Topic	Period	Mitigation/Avoidance Description
Utilities, Energy, and Electromagnetic Fields	3.15	Utilities	Long-Term	No mitigation required.
			Construction	No mitigation required.
		Energy	Long-Term	No mitigation required.
			Construction	No mitigation required.
		EMF	Long-Term	No mitigation required.
			Construction	No mitigation required.
Historic and Archaeological Resources	3.16	Historic and archaeological resources	Long-Term	No mitigation required.
			Construction	An Inadvertent Discovery Plan, which addresses the process and procedures for potential archaeological finds during construction, has been developed and would be in place prior to the start of construction.
Parks and Recreational Resources	3.17	Parks and Recreational Resources	Long-Term	No mitigation required.
			Construction	No mitigation required.
Section 4(f) and 6(f) Resources	3.18	Section 4(f) and 6(f) Resources	Long-Term and Construction	No mitigation required.

SoundTransit

June 2024

1 Introduction

The purpose of this appendix is to provide a description of potential design refinements to the Preferred Alternative and an overview of potential environmental impacts. It also identifies elements of the environment where the potential impacts of the design refinements would differ from those described in the Final Environmental Impact Statement (EIS).

As discussed in the Final Environmental Impact Statement (EIS), of the three build alternatives, the Preferred Alternative would have the greatest impacts to ecosystem resources, specifically streams, mature native forest, and wetlands. The U.S. Army Corps of Engineers expressed concerns over the amount of wetland impacts during environmental review and permit preapplication coordination meetings. Acknowledging these concerns and recognizing the potential scope, budget, and schedule ramifications of a complex environmental permitting and mitigation process, Sound Transit is exploring the feasibility of refining the Preferred Alternative design to further reduce ecosystem impacts. Sound Transit is also exploring the feasibility of reducing utility impacts that could also have scope, budget, and schedule implications. Key site design refinements include the following:

- Rotating the Operations and Maintenance Facility (OMF) South site elements 90 degrees
- Shifting the proposed 18th Place S extension to the east and out of the wetland on the northwestern portion of the site (Wetland WFW-02)
- Reducing the number of lead tracks to access the site from four to two
- Moving the main gate from S 341st Place to 18th Place S and adding a secondary gate on S 336th Street
- Removing Link System-Wide Storage from the site
- Switching the location of the mainline track and test track so that the test track would be on the west side of the mainline track rather than the east side

A conceptual design showing these refinements is provided in Figure K.1-1. All of the design refinements are anticipated to be within the potential construction limits of the Preferred Alternative, as described in Chapter 2 of the Final EIS. The design refinements are anticipated to have similar impacts as described for the Preferred Alternative to most elements of the environment, listed below. As a result, these elements are not discussed further in this appendix.

- Acquisitions, displacements, and relocations
- Land use
- Economics
- Environmental justice, social resources, community facilities, and neighborhoods
- Air quality and greenhouse gas emissions
- Water resources
- Geology and soils
- Hazardous materials

Potential Preferred Alternative Design Refinement

N

0 1,000 2,000 Feet

- Public services
- Utilities, energy, and electromagnetic fields
- Historic and archaeological resources
- Parks and recreational resources
- Section 4(f) and 6(f) resources

For other elements of the environment, the design refinements may have different impacts than described in the Final EIS for the Preferred Alternative. Those elements of the environment are discussed qualitatively below.

- Transportation
- Visual and aesthetic resources
- Noise and vibration
- Ecosystem resources

If the Sound Transit Board selects to build the Preferred Alternative and the design refinements are advanced, additional environmental review of certain elements of the OMF South impact analysis and mitigation measures may be needed.

1.1 Transportation

The potential design refinements would change the access points into the OMF South site. The main gate would be accessed from 18th Place S, north of S 341st Street instead of from S 341st Place east of the S 18th Place intersection as currently shown for the Preferred Alternative (see Figure K-1). A secondary access point would be on S 336th Street and would have limited use for deliveries and possibly emergency services serving the OMF South site. Moving the gate access to S 18th Place would not be expected to substantially change general traffic movements in the area beyond what was analyzed in the Final EIS for the Preferred Alternative. The limited traffic at the S 336th Street secondary access would not be expected to impact traffic volumes along S 336th Street. No new traffic impacts are anticipated with the design refinements.

1.2 Visual and Aesthetic Resources

Changes to 18th Place S, track, and building locations within the OMF South site itself are not anticipated to change visual impacts to sensitive receivers next to the site.

One design refinement would switch the location of the mainline track and test track so that the test track would be on the west side of the mainline rather than the east side, as described for the Preferred Alternative. The Preferred Alternative design has a high visual change and high visual impact to residences along the mainline within Belmor and along 24th Avenue S to just north of S 336th Street. Switching the test track location would change the view of the primarily elevated mainline to the test track. However, it would not change the high visual impact, as identified in the Final EIS for the Preferred Alternative.

1.3 Noise and Vibration

As stated above, the potential design refinements would switch the location of the mainline track and the test track within Belmor and along 24th Avenue S and change the orientation of the OMF site, which would move the location of the northern lead track into the OMF South site to the south. Moving the northern lead track into the OMF South site would position the track and associated crossovers and turnouts farther from residences located to the north of S 336th Street.

The mainline track structure for the Final EIS Preferred Alternative provides shielding for the residences in Belmor from the noise generated by the at-grade test track. Switching the locations of the tracks would remove that shielding. However, most of the transit noise would be generated by the cumulative Tacoma Dome Link Extension (TDLE) operations on the mainline tracks in the future. The change in the location of the test tracks would also potentially affect the exposure to highway traffic noise levels from I-5. The cumulative changes in the OMF South mainline tracks noise, the traffic noise, and the TDLE mainline operations noise could result in additional impacts in the vicinity of Belmor and need for additional noise mitigation.

At the northern end of Belmor, the mainline tracks for the Preferred Alternative are on an elevated structure, which reduces the vibration levels relative to at-grade track. Relocating the at-grade test track closer to the residences in the northern portion of Belmor could result in new vibration impacts in this area and the need for vibration mitigation.

If the design refinements or other similar changes were to advance, Sound Transit would conduct noise and vibration analysis during final design. All predicted noise levels and mitigation measures would be reviewed, and mitigation would be modified as needed to reduce noise levels to below the FTA impact criteria. When noise would exceed FTA moderate or severe impact criteria, Sound Transit would provide noise mitigation measures consistent with its Link Light Rail Noise and Vibration Policy (Resolution No. R2023-15) and the Transit Noise and Vibration Impact Assessment Manual (FTA 2018).

1.4 Ecosystem Resources

One of the potential design refinements would shift the proposed alignment of 18th Place S approximately 100 feet east in the vicinity of Wetland WFW-02 and the West Fork Hylebos Creek Tributary 0014C. This would move the proposed road alignment out of Wetland WFW-02 and the West Fork Hylebos Creek Tributary and thus avoid direct impacts to the wetland and stream. This design could potentially reduce long-term wetland impact areas up to 30 percent compared to the Preferred Alternative analyzed in the Final EIS. The shifted alignment of 18th Place S extension would only affect the buffer areas of Wetland WFW-02 and buffer areas of the West Fork Hylebos Creek Tributary. Figure K.1-2 compares the conceptual layouts of the Preferred Alternative and the potential design refinement in relation to the existing wetlands and streams and their buffers.

The eastern site boundary that parallels East Fork Hylebos Creek Tributary could potentially shift to the west 10 to 20 feet, which may allow for a larger stream corridor than currently analyzed in the Final EIS.

2 NEXT STEPS

If the Sound Transit Board selects the Preferred Alternative as the project to be built, Sound Transit would continue to explore the feasibility of the Potential Preferred Alternative Design Refinements or other measures that could reduce project impacts. If the design refinements are advanced, additional environmental review of certain elements of the OMF South impact analysis and mitigation measures may be needed.

Appendix B 31

1. Study Purpose

The Midway Landfill site is one of the three sites identified by the Sound Transit Board to be included in the Draft EIS as part Phase 2 of the OMF South project. The other two OMF South sites are located in South Federal Way.

The Phase 2 scope of work included a task to help optimize the Midway Landfill site layout. As a former landfill with varying depths of waste, ground settlement is a major concern that needs to be addressed during design. To accomplish this, two workshops were conducted with representatives from the City of Kent, the City of Federal Way, City of Seattle, Seattle Public Utilities (SPU), WSDOT, and various consultants and ST staff.

2. Proposed Phase 1 and Phase 2 Site Layouts

Exhibit 2.1 shows the site layout for the Midway Landfill alternative, Site 3 (North/South) that was developed during OMF South Phase 1: Alternatives Analysis. The site plan included the additional 5-acre storage area with a 30,000 sq. foot warehouse building as requested by ST. The site was adjacent to I-5 and covered the eastern portion of the landfill with the storage tracks on the eastside of the site and the maintenance building on the west side of the site.

3. Midway Landfill Site Optimization Workshop No.1

The first Midway Landfill Workshop was held at Sound Transit on August 13, 2019. The purpose of the workshop was to launch a collaborative effort to understand and brainstorm Midway Landfill OMF Sound ground settlement solutions. The minutes from the workshop are attached.

3.1 Workshop Objectives

The objectives of the workshop are listed below:

- Create a shared understanding of Sound Transit's operational and maintenance criteria
- Create a shared understanding of the basis of design used to develop Sound Transit's current Midway Landfill concept for the OMFS
- Review and understand additional information that has become available on the Midway Landfill site
- Outline an action plan for how and when additional ideas will be implemented into the planning process

3.2 Light Rail Operations and Maintenance Criteria

Paul Denison, Light Rail Executive Operations Director and the person charged with overseeing their efficient, clean, and safe daily light rail operations, gave an overview of typical light rail OMF operations

Maintenance work occurs at night in regimented order, requiring about 35 minutes per train (assuming no issues). Any train requiring work beyond ordinary nightly maintenance is decoupled and brought into the shop. Paul clarified that light rail is electric propulsion train technology. These vehicles run on very precise electrical connections, which require a precise contact pattern for interface with the electrical distribution system. Tolerances are in a fractions-of-an-inch range.

The most expensive aspect of light rail operations is labor; when more labor is required due to the inefficiency of a site or its upkeep, the cost model would need to be revised.

Paul walked through Sound Transit's Design Criteria Manual (DCM) specific criteria relative to operations and maintenance facility sites. The DCM doesn't specify maintenance cycles for buildings or track, nor acceptable maintenance practices. On the site, there is a lot of special track work – crews have to regularly lubricate rail by hand on tight turns to prevent wheel climb. Also, FTA requires the facility to be in a “state of good repair” to be able to receive grant money; they consider and inspect equipment, access, and the overall program. The facility must meet certain criteria and document any adjustments through a work order process.

Other clarifications provided:

- Pantograph contact with the OCS has tight tolerances. Wires are fixed tension.
- Yard inspections are held every 30 days.
- Drainage is of critical importance. Mechanical drainage systems don’t work, as the failure rate is too high.
- Grounding is floating. Must keep the grounding for the building and for the track separate.
- At the Forest Street OMF, hand tamping is completed every 3-12 months to adjust for settling. Historically, the site was a tide flat. Some fine tuning is expected. Additional details on maintenance criteria used by Operations can be found in Appendix A.

3.3 Brainstorming Ideas and Evaluation

Below is a list of brainstorming ideas which have been identified by group:

- Excavation (EX)
- Ground improvement (GI)
- Structural (STR)
- Layout optimization (LAYOUT OPT)
- Maintenance (MAINT)
- Schedule (to be ready for opening day and major milestones)
- Construction (means, methods, coordination)
- Code conformance
- Risk factors
- Ability to provide level of light rail service (efficiency and operability)
- Cost

The team went through the exercise of ranking the brainstorming ideas qualitatively as High, Low, and Medium for each category with respect to settlement risk, with respect to the brainstorming ideas listed above.

3.4 Next Steps

Sound Transit took the brainstorming ideas and put them in format that could be readily evaluated. A matrix was developed and sent to the participants with instructions on how to provide comments on the various brainstorming ideas. The result of this activity was used to develop material for the second Workshop.

4. Midway Landfill Site Settlement Workshop No. 2

The second Midway Landfill Workshop was held at Sound Transit on October 3, 2019. It provided an opportunity to review the results of the work that had taken place since Workshop No. 1 in August. The minutes from the workshop are attached.

4.1 Workshop Objectives

The objectives of the workshop are listed below:

- Review brainstorming solutions from OMF South Landfill Settlement Workshop No. 1
- Share evaluation process and initial results of brainstormed settlement design concepts
- Understand collective perspectives around design concepts
- Outline plan for designs to continue to pursue

4.2 Review of the Forest Street OMF Detail

During the first workshop, the question came up of whether or not the Forest Street OMF was built on a landfill similar to what is being considered for the Midway Landfill site. Sound Transit did some research on the Forest Street site design, including geotechnical borings that were done prior to construction of the facility. The research revealed that the Forest Street OMF is built on tidal flats that had been filled over time. The initial contract for the Forest Street OMF was for site preparation. Three to four feet of the site was excavated and the soil mixed with concrete to stabilize the soil. This was followed by the construction contract to build the facility, which included the maintenance building which is constructed on over 1,200 piles driven to a depth of up to 130 feet. The conclusion was that the Forest Street OMF site conditions are not comparable to the site conditions at the Midway Landfill site.

4.3 Optimization of Midway Landfill Site Layout

Steve Radomski explained how the optimized layout was refined with priority to operational efficiency, and analysis of brainstormed solutions from the first Settlement Workshop. This meant that, rather than defining the shallowest areas of solid waste and placing specific site elements in those locations, the site layout is currently optimized for in/out efficiency and minimization of necessary train movements on a daily basis. Layout refinements and assumptions included:

- Locating the staff parking lot entrance away from S 252nd St., which could have impacted traffic and residents in the adjacent residential area, as opposed to from SR 99.

- Moved the MOW building inside the yard.
- Increased the number of service tracks from 12 to 14 to provide additional wash and training lanes.
- No significant frontage improvements anticipated on SR 99 at the Midway Landfill site.
- Mitigating disruption to the existing stormwater detention pond on the landfill.
- Relocated the landfill gas flare facility to the west side of the detention pond.
- While refining the layout, it became apparent that proposed site layout was slightly off of the landfill. Sound Transit reviewed the Board motion language which instructed that it be built mostly on the landfill, so an additional need for some property in the vicinity of SR 99 was not deemed in conflict with Board direction.

Exhibit 4.1 shows the evolution of the Midway Landfill Site layouts as the Charrette with Sound Transit Operations staff progressed over a four-day period. The diagram in the bottom right corner of **Exhibit 4.1**, shows the final layout that will be used to document the facility requirements in a separate report.

4.4 Review of the Brainstorming Design Concepts Evaluation

The brainstorming ideas from the first workshop were grouped into five major subject categories as listed below:

1. Structural
2. Excavation
3. Geotechnical
4. Layout
5. Maintenance

Within each of the categories listed above, Settlement Risk Criteria were used to evaluate the brainstorming ideas. These five criteria are listed below:

1. Regulatory
2. Schedule
3. Cost
4. Constructability
5. Maintenance and Reliability

Appendix B includes individual tables for the five major subject categories listed above. The tables also include the individual Settlement Risk Criteria listed above, applied to each of the major subject categories. The next step in the process was to rate each brainstorming concept using the color coded system shown in **Table 4.1** below.

TABLE 4-1
Rating System

1 = Low performing	🟥
2 = Medium performing	🟨
3 = High performing	🟩

The basis for a rating of 3 = High Performing is shown in **Table 4.2** below.

TABLE 4-2
Basis for a Rating of 3=High Performing

Settlement Risk Criteria	Measure
Regulatory Risk	Predictable Permitting (ROD, EPA. Closure Plan, Ownership, Long-Term)
Schedule	Ability to Open in 2026
Cost Rick	Meets ST3 Budget
Construction Risk	Assuming Routine Means and Methods
Maintenance & Reliability	Supports Revenue Service & Maintenance Operations without Impacts (settlement)

4.5 Review of the Brainstorming Design Concepts

Sound Transit introduced five potential design concepts based on the brainstormed ideas from the first workshop. The five design concepts are listed below:

1. High structural platform on drilled shafts with no excavation
2. Low structural platform on shorter drilled shafts with some excavation
3. Hybrid 1: Excavation with ground improvements (buildings on drilled shafts)
4. Hybrid 2: Excavation with ground improvements (slab on grade for tracks and buildings on drilled shafts.
5. Full excavation and backfill with competent soils

Each design concept has a north/south cross-section through the site which illustrates the native soils and fill depths. **Exhibit 4.2** shows the location of the "cut" through each site that was used to illustrate the cross sections.

1. High Structural Platform on Drilled Shafts with no Excavation

- Same as Phase 1 option
- Minimum impact to landfill Cap(a goal, as we assessed the potential to impact regulatory components in case we excessively disturb the CAP)
- 3 ft. thick slab, supported by 10 ft. diameter shafts
- Requires elevated guideway to connect to transit mainline
- Approx. 70,000 CY of excavation (augured) for shafts

4.6 Refinements to Design Concepts

At the conclusion of the second workshop the cross-sections for the initial design concepts were modified as shown in **Exhibits 4.8 through 4.12** on the following pages.

The new cross-sections include an earthwork summary with the estimated amount of cut and fill. They also show the limits of the excavation, the imported fill, and the deep dynamic compaction and surcharge preload, if applicable. The design concepts will be refined during the 10% design based on the Federal Way Link extension guideway alignment as well as the landfill excavation and reuse information from the Design Builder.

4.7 Summary of Next Steps

1) 5 approaches to be carried forward to 10% CE design; will continue to investigate ways to optimize the approaches
2) Assessment of schedule, budget, and constructability for each approach
3) Meetings with Ecology, EPA, KC Public Health & SPU to understand regulatory framework
4) ST Legal Department review of property rights, conditions/covenants, risks
5) Preparation of a Human Health Risk Assessment

WORKSHOP SUMMARY
Operations and Maintenance Facility South

Meeting Subject: Midway Landfill Site Settlement Workshop No. 1
Meeting Date: August 13, 2019
Meeting Time: 8:30 AM – 4:0 PM
Meeting Location: Sound Transit, 401 S Jackson, Santa Fe Room
Meeting Purpose Launch collaborative effort to understand and brainstorm Midway Landfill OMF South ground settlement solutions

Meeting Objectives

- Create shared understanding of Sound Transit's operational and maintenance criteria
- Create shared understanding of basis of design used to develop Sound Transit's current Landfill concept for the OMF South
- Review and Understand additional information that has become available on the Midway Landfill site
- Outline and action plan for how and when additional ideas will be implemented

Time	Agenda Topic	Lead(s)
8:30	Introductions and expectations	Taylor, Long and All
	Erin welcomed the group and expressed appreciation for their participation for the day. She asked for a round of introductions with question: "what do you hope to begin today for the Operations and Maintenance Facility South (OMF South) Midway Landfill site?" The group introduced themselves and provided hopes for the day. The group committed to the following ground rules for the workshop: • Be present (phones) • Listen • Speak from intentions (not entrenched positions) • Offer space to everyone to speak • Remember: we are unlikely to solve everything today, but we are setting a course/path forward together	
8:45	Safety Moment	Bennett
	Paul offered safety/evacuation information for being in Sound Transit offices.	

Time	Agenda Topic	Lead(s)
8:50	Review Meeting Agenda, Objectives	Taylor
	Erin covered the workshop agenda and objectives. She noted that it that some ideas or issues that came out of the day may be very relevant to Midway Landfill analysis, but unrelated to the settlement workshop purpose, and would be noted as a parking lot item.	
9:00	OMF South: Process to date and looking ahead	Hawkins

	Curvie provided a project overview for the group. He clarified that the OMF South was included in the Sound Transit 3 plan, to be one of four OMFs in the region (others are central/Forest Street operating today, East under construction, and north to be sited in the future). The facility will support multiple projects, and ultimately entire light rail network; timing for its opening is anticipated support Tacoma Dome and West Seattle extensions when they are slated to open in 2030.
	• Sites under consideration. Curvie clarified that while there is a focus on the Midway Landfill today, there are three sites under consideration as part of SEPA Environmental Review: the Midway Landfill in Kent, and two sites in Federal Way. These three are narrowed from an initial screen of 24 sites identified through public early scoping in April 2018. The environmental process will evaluate all sites equally, with the end goal of identifying the best site possible to serve the south corridor.
	  • Site needs. Curvie covered multiple needs to site this facility to store and maintain light rail vehicles at the end of each operational day (1-4 a.m.): it must be minimum of 30 acres, but due to topography and site circulation a likelihood of 40-50 acres in size. It must connect to the Federal Way or Tacoma Dome Link extensions, and provide system-wide operational needs. It will require 18 storage tracks to accommodate 140+ vehicles, Maintenance of Way building, parking, track leads.
	  • Schedule. Curvie provided the timing of the project as a key driver for feasibility analysis of settlement solutions. The site must be open by 2026 to receive and hold vehicles as they are commissioned for service ahead of TDLE in 2030. He clarified that each of the two Federal Way sites, if selected, would necessitate building guideway ahead of TDLE schedule. A Draft EIS for the OMF South is expected in late 2020, and the Board Decision on the site to be built is anticipated for mid/late 2021.	

9:15	Light rail operations and maintenance criteria	Dobbins, Denison,
	Paul Denison provided an overview of typical light rail maintenance and operations as the person charged with overseeing their efficient, clean and safe daily operations. Maintenance work occurs at night in regimented order, requiring about 35 minutes per train (assuming no issues). Any train beyond ordinary nightly maintenance is decoupled and brought into the shop. Paul clarified that Light rail is electrical train technology. These vehicles run on very precise connections, which requires correct contact pattern necessary for electrical interface. Tolerances are fractions-of-an-inch range.	

<table>
<tr><th>Time</th><th>Agenda Topic</th><th>Lead(s)</th></tr>
<tr><td></td><td colspan="2">

Paul provided perspective that the most expensive aspect of light rail operations is labor; when more labor is required due to inefficiency of a site or its upkeep, he needs to revise the cost model.

Paul walked through Sound Transit’s DCM specific criteria relative to operations and maintenance sites (see previous slides). The DCM doesn’t specify how long the building or track must be maintained. On the site, there is a lot of special track work – crews have to lubricate rail by hand on tight turns to prevent wheel climb. FTA requires the facility to be in a “state of good repair” to be able to receive grant money; they consider and inspect equipment, access, and overall program. The facility must meet certain criteria and document any adjustments through work order process. Other clarifications he provided:

Pantograph, tight tolerances. Wires are fixed tension.
Yard inspections are held every 30 days.
Drainage is of critical importance. Mechanical drainage system doesn’t work, failure rate is too high.
Grounding is floating. Must keep the grounding for the building and for the track separate.
At Forest Street, hand tamping is completed every 3-12 months to adjust for settling. Historically, the site was a tide flat. Some fine tuning is expected.

</td></tr>
<tr><td>9:30</td><td>Perspectives from other agencies (5 min each)</td><td>All</td></tr>
<tr><td></td><td colspan="2">

SPU / City of Seattle

The Midway Landfill began to accept waste in 1960s (existing quarry before then). It discontinued accepting waste in 1983, and the cleanup remedy was complete in 1991.
Over the past 25 years, numerous proposals for re-use of the site; this particular proposal may be the best potential match.
SPU will help facilitate exploring the feasibility of the site. From their perspective: “if it works out, great. If not, we gave it our best try.”
Reflecting on the age of the remedy and settlement to date, the site is “running out of gas”, and settlement is reduced.
Waste varies in thickness in different zones (0-60-100 feet), and settlement will follow that trend.
Settlement mapping has been completed since 1988, and there are more current aerial surveys.

City of Kent

Kelly: Reflected is has already been a difficult process to locate this OMF so far, but the City of Kent welcomes the OMF South with open arms on the landfill location. The city believes this is a good solution for the region and wants help make it work.

</td></tr>
</table>

Time	Agenda Topic	Lead(s)
	3. City of Federal Way • Tony: Other two site options for the OMF South are located in Federal Way, but both likely come with major impacts – including industrial/business and church relocations. The Midway Landfill site is the City's preferred location. 4. WSDOT • WSDOT will be most interested where this site could potentially tie into the mainline, and protect WSDOT assets. They want to help Sound Transit understand, then get through the protocols.	
9:45	Break and conversations	
10:00	Q&A for previous presentations	Taylor
	• Erin and Blane asked for questions from the orientation presentations earlier in the morning. o Kate S: Is there work specific to storage track vs. the rest of maintenance track? ▪ Paul D: We want to avoid working on trains while on the tracks. We do not allow anyone in/around trains when they're on storage tracks, as they trains move around. The shop is where most of the maintenance takes place. When the yard is at capacity, that means even more moves, tighter work area. o Jeff N: Would more "elbow room" increase curvature tolerances? Would it help to make yard bigger? ▪ Paul D: Our maintenance staff walk, so their efficiency is a consideration due to their ability to do the job, and number of people to do so/paid to be on site at any given time. But yes, if we had bigger curves, wouldn't have to hand grease them. ▪ Jason B: Physically, you can increase turn radius, but larger turnouts take up a lot more room. In addition, the turns we have are interchangeable across our system, so changing these would be a consideration. o Kate S: What is the preferred method for drainage to work? ▪ Jason B: Preferred way is a ditch with a 33% slope. We do use under drains; the track is flat, so we make up that hydraulic gradient under track. Drains placed every two tracks. For collection and discharge, Forest Street had existing storm/sewer lines, and we have an agreement with city for discharge. ▪ Jeff N: For understanding, the landfill has a detention pond, that was sized in 1991. [The group considered the potential need to bring the pond to code.] ▪ Landfill is impermeable, and it has existing underdrains that drain to a pond. o Jeff N: Is there a way to rank in descending order the heaviest programming elements to the lightest?	

Time	Agenda Topic	Lead(s)
	▪ Paul D. – The building is the most important and heaviest element, and must be stationary due to vehicles entering/existing. ▪ Jason B: Building would be biggest load, then storage tracks, we cannot adjust the building if there's settlement. [DCM states loads required] ▪ Steve R: Forest Street is a good example. Parking lot has tolerances, but parking areas fit into dead areas, surrounded by track areas. Most of the site has very small tolerances, it needs to be very stable. ▪ Mike W: At Forest Street, the building was constructed on 1200 piles (on tidal flat), pounded in. Today, there are limits to what can be done with that building due to its foundational structure. For example, a newer refurbishment required selection of an above-ground lift because to accommodate inability to cut into the floor of the structure. o Ian S: The building is supported by piles, but surrounding area is not? ▪ Jason B: At Forest Street, the building is supported by piles with a transition area. There was ground improved to support loads under ballast. Impact slabs, concrete aprons on either side that support gradual transition out to yard. o Kate S: It was mentioned that five more acres would be beneficial – why? ▪ Paul D: Ideally, we need an area for "laydown" to store items for the entire system. At Forest Street there is no place to store things specific to service. Need a 30,000 SF building to store stuff like spare rails, spare switches, machines, clips, and glasswork. If we cannot site a building of this nature at OMF South, it could require a separately staffed facility. All three sites include this building (included in programming). o Kelly: Are there issues with OCS settlement at Forest Street? ▪ Paul D. – There were issues with door bridges early on, but was not due to settlement. Each OCS was constructed on real piles; the guideway piles are around 15 feet deep; OCS structure throughout the yard has been stable. o Jason B: Is there a historic record of aerial photography of the landfill? ▪ Jeff N: Yes, supplemented by on the ground work from GeoEngineers in April 2019 ▪ Ed H: In April 2019, the TDLE team flew the entire corridor at .2 feet. The comparison work has not been completed.	
9:40	Overview of current ST design	Mudayankavil/ Harris
	▪ **T**homas presented the current design. At this level of design, it has used a typical, non-modified layout (also used for all sites considered). This meant a template was dropped in for Phase 1. The unique aspect at this location was connection tracks to mainline (to be refined in Phase 2 of the project). ▪ Based on potential settlement considerations, the current design placed the entire site on slab supported by piles. Piles are 160 feet deep. For a conservative approach, everything was assumed to be above grade, with	

Time	Agenda Topic	Lead(s)
	nothing on the landfill itself. An underlying assumption was the requirement to maintain the landfill below the slab. ■ In the upcoming design work (to 10% design), the site will be modified for an optimized site fit. The Sound Transit Board direction identifies the site as on the landfill itself; this limits any acquisition of private parcels west of the site. ■ Dave Peters clarified that assuming we stay above the existing cap, this would govern elevation, but some pits within the facility are required to maintain trains from beneath (roughly six feet deep). ■ Ed Herald provided context that the existing landfill structural design was completed as the project also considered 22 sites over a 3-week period, so there was limited time invested in the site solution. The team did come up with platform solution but not sure that's the best solution. The team provided the perspective that settlement understanding will be the key to how we optimize this site.	
10:10	Overview of GeoEngineers report for City of Kent	Kent/ GeoEngineers
	• **Tim Bailey** outlined the study that the City of Kent commissioned in order to investigate if landfill is "old and not settling much." This work included comparison of LiDAR data from 2005-2016, predicted future settlement, and compared to actual settlement 2016-2019. Overall, the actual measure of settlement was less than what they predicted with the model. • Tim also projected forward 50 years out from closure (1991), which would expect to see less than a foot of settlement anywhere across site except for WSDOT ROW. He reflected in comparison to the criteria provide for operations and maintenance by Sound Transit, that "that's not where we need it to be, but at least bounds the problem." In general, the site has completed primary and secondary settlement; now there is long-term component, which indicates a steady rates of settling moving towards zero. • Doug: What is settling and what is causing it? Tim: Based on records/borings, landfill waste has a lot of soil intermixed so long term settlement is due to degradation of the waste. The site is capped, keeping stormwater out. Jeff N: There is reduce stormwater-contaminated runoff. Groundwater levels are below the waste. Shallower waste is extremely dry. A lack of moisture has slowed the degradation/ creation of gas. Landfill gas is down 85% from where it was in the 1990s. The settlement curve flattens out for a long time. If waste gets wet, that could change decomposition rate. • Gwen: Any common themes about why previous site proposals would not work? Jeff N: As a theme, those proposers found better alternatives for their development sites. • Dwight: Will employees working at site be affected by anything? Jeff N: If we do our job, no. There is no exposure pathway for groundwater.	

Time	Agenda Topic	Lead(s)
	Kate: Landfill is required by EPA to prevent pathways for exposure. The City of Seattle needs to maintain those controls in perpetuity. We can reconstruct landfill cap as part of doing the site. • Jason B: What's the maintenance life of a cap? Kate: It depends on how you design it, but a cap is designed to last in perpetuity. • Curvie: We must be sensitive to schedule, and it is not clear on what is involved in breaking cap and regulations associated with that, and impacts to schedule. Kate: The City is working on a separate path with FWLE to work through regulatory process, so will have answers for timing on pathway when agreement done by next June (2020). • Dwight: In terms of degradation and settlement, are there other ideas to preloading? How much consolidation would you get out of this? Tim: In general, there will need to be a design so that any/all of the primary and secondary settlement is taken care of. Preloading time depends on thickness of area. Perhaps years, but could be accelerated.	
10:45	Discussion/brainstorm alternatives for consideration	Long and All
	• Blane Long conducted a brainstorm to generate settlement and site alternatives for consideration based on the seed ideas. [See attachment to summary for brainstormed and categorized ideas in raw form, from the workshop for documentation purposes]	
11:30	Lunch	
12:40	Additional clarification for each of the brainstormed ideas	Long and All
	• Blane Long continued the discussion of brainstormed ideas for settlement, clarifying details and grouping the ideas into categories for additional analysis and detail: o Excavation (EX) o Ground improvement (GI) o Structural (STR) o Layout optimization (LAYOUT OPT) o Maintenance (MAINT) [See attachment to summary for brainstormed and categorized ideas in raw form, from the workshop for documentation purposes]	
1:30	Review, add to, and confirm evaluation criteria (requirements vs. performance attributes), alternatives to be examined and extent of study	Long and All
	• Blane Long conducted a brainstorm of criteria to evaluate settlement alternatives relative to each other: o Schedule (to ready for opening day and major milestones) o Construction (means, methods, coordination) o Code conformance	

Time	Agenda Topic	Lead(s)
	o Risk factors o Ability to provide light rail service (efficiency and operability) o Cost [See attachment to summary for brainstormed and categorized criteria in raw form, from the workshop for documentation purposes]	
2:00	Define follow-up activity/report • In concluding the workshop, the team asked: "What have we forgotten?" for the good of the order: o Ian – Please consider needs around property transaction, acquisition, property rights, regulatory engagement. Opening of ROD could impact schedules o Jeff N. – Request for tour of Forest Street Facility, offers a site visit at Midway Landfill. The team said that could be arranged, and late night when the site is most active would be most illustrative.	Sound Transit
2:30	Adjourn and Next Steps/future for meetings 2 and 3: Erin concluded the meeting asking for the group to reflect on a learning item from the meeting; many reflected they learned from one another and appreciated the collaborative environment. Future meetings were detailed as follows: - Meeting 2: Draft evaluation report of alternatives from HDR and feedback (TBD timing, likely mid-September) - Meeting 3: Sound Transit communicates solution(s) taken into the design as reflected in Draft EIS (TBD timing)	

Handouts/Reference Materials:

- Midway Landfill Early Conceptual Site Plan
- Midway Landfill Basis of Design
- GeoEngineers' Report for City of Kent

Attendees:

Dave Peters, Curvie Hawkins, Gwen McCullough, Chelsea Levy, Mark Jusayan, Kate Snider, Ian Sutton, Hui (Hugh) Yang, Jeff Neuner, Tim Bailey, Allison Dobbins, Jason Baily, Michael Williams, Steve Radomski, Paul Bennett, Tony Doucette, Kelly Peterson, John Sleavin, Paul Denison, Hussein Rehmat, Jessica Giblin, Thomas Mudayankavil, Brian Harris, Bob Mitchell, Jason Funk, Ed Herald, Cristina Seo, Dwight Miller, Andrew Austin, Ben Wolters, Erin Taylor, Blane Long

Appendix B

STRUCTURAL

		RISK					
NO.	**BRAINSTORM IDEAS**	**REGULATORY**	**SCHEDULE**	**COST**	**CONSTRUCT-ABILITY**	**MAINTENANCE / RELIABILITY**	**FACTORS CONSIDERED FOR RANKING**
1	Heaviest building loads toward middle of site with piles, with transition slabs, west dynamically compacted and/or partially excavated – Kate, depending on area of site	1 (a, b,e,f)	2 (a, b, c)	1 (a, b,c)	1 (a, b, c,)	1 (d)	a. Dynamic compaction impacts to exist. solid waste b. Landfill excavation c. Transition slabs - some settlement expected d. Settlement concern e. Potential groundwater contamination f. Construction noise and vibration
2	On east side, consider a floating mat foundation that is connected by hinged slabs – Kate (landfill grading would be necessary)	2 (a,b)	2 (a,b,c)	1 (a,c)	2 (a,c)	1 (d)	a. Floating slab b. Some excavation c. Non-traditional construction methods d. Uneven settlement concern
3	Take current track bridge technology being used on I-90 bridge; alternatively use track bridge throughout the site – Paul	2 (b)	1 (b,e)	1 (a,b,c,e)	1 (b, e)	1 (c,d,e)	a. Layout impact b. Includes excavation c. Maintainance d. Uneven settlement concern e. New technology was designed for bridges
4	Consider track on rigid structure, as opposed to the entire site on structure (e.g., pin piles/bridge structures) - David	2 (a,c)	2 (a,c)	1 (a,b,c)	2 (a,c)	3 (a,b)	a. Buildings on deep piles b. Track on slab supported by piles c. Includes excavation
5	Consider track on floating slab so that tracks are settling as a unit on a rigid slab Note: Difficult transitions to the buildings	2 (a)	2 (a,c)	1 (a,c)	1 (a,c)	1 (b)	a. Includes some excavation b. Uneven settlement concerns c. Non-traditional construction methods
6	Consider OCS on shallow foundations – Tim Note: Minor element compared to larger OMFS considerations and effectiveness depends on adjacent track construction	NA	NA	NA	NA	NA	a. Settlement concerns
7	Consider storage tracks on floating slab and pin piles on turnouts/ladders with carefully monitored transition slabs between the two (monitor drainage) - Jason Note: Transition design will be critical to the success of this approach	2 (a)	2 (a,b)	1 (a,b)	1 (b)	1 (c)	a. Includes excavation b. Non traditional construction methods c. Uneven settlement between transition slabs
8	Consider lightweight fill materials for mass grading areas Note: May help reduce settlement	2 (a)	2 (b,c)	1 (b,c)	2 (c)	1 (d)	a. No special permits b. Includes excavation c. Special construction methods d. Long-term settlement concerns
9	Optimize current ST-proposed design for column size/structure size and ensure have right design to evaluate; use other deep foundation alternatives that do not create a pathway (groundwater) Notes: Expected to occur during detailed design if option is selected	2 (a,b)	2 (a,b)	1 (a,b)	3 (a,b)	3 (a)	a. Structural slab supported by optimum size piles b. Replace cap
10	Manage settlement/create interfaces and have redundancy to do so (e.g., extra runaround where you expect differential settlement) - Kate Note: This should be in combination with other options	2 (a)	2 (a,b)	1 (a,b,d)	2 (a)	1 (c)	a. Includes some excavation b. Added ROW and construction cost c. Differential settlement d. Manage settlement (maintenance cost)

LAYOUT

NO.	BRAINSTORM IDEAS	RISK					FACTORS CONSIDERED FOR RANKING
		REGULATORY	SCHEDULE	COST	CONSTRUCTABILITY	MAINTENANCE/ RELIABILITY	
1	Relocate SPU flare facility (on NW corner of site) to get area on native soils (where exist) – Jeff	2 (a)	NA	1 (a,b)	NA	1 (b)	a. Relocation of flare facility b. Layout on landfill
2	Use property to Northwest of site (west of pond, owned by SPU) due to availability of native soils - Jeff	NA	NA	1 (a,b)	NA	1 (b)	a. Requires additional ROW b. Layout on landfill
3	Move Maintenance of Way building location as depicted in initial concept to west, so that not just in center of site; optimize track yard layout to shift as much as possible to west, which may adjust to be a non-regular rectangle (some area between tracks in middle of site would be spread out)	NA	NA	1 (a,b)	NA	1 (b)	a. Requires additional ROW b. Layout on landfill
4	Move farther north with the track and turnouts, as well as some storage facilities - Dwight	NA	NA	1 (a,b)	NA	1 (b)	a. Requires additional ROW b. Layout on landfill
5	Manage settlement/create interfaces and have redundancy to do so (e.g., extra runaround where you expect differential settlement) - Kate	NA	NA	1 (a,b)	NA	1 (a,b)	a. Requires additional ROW b. Layout on landfill
6	Sophisticated, automatic-alerting settlement monitoring systems (use them) - Kate	NA	NA	NA	NA	1 (a)	a. Layout on landfill
7	Consider flipping building and storage tracks or layout of storage tracks - Blane	NA	NA	NA	NA	1 (a)	a. Layout on landfill
8	Relocate existing pond as it is on native soil/take advantage of north edge of the site - Thomas	NA	NA	1 (a)	NA	1 (b)	a. Requires additional ROW b. Layout on landfill
9	Make pond a vault underneath the yard/site	NA	NA	1 (a)	NA	1 (a)	a. Layout on landfill
10	Pervious pavement for parking lot/use gravel	NA	NA	1 (a)	NA	1 (a)	a. Layout on landfill
11	Reconfigure as a dogleg to take advantage of the shallow areas (in spite of track inefficiencies) – Paul	NA	NA	1 (a)	NA	1 (b)	a. Requires additional ROW b. Operationally inefficient

OMF South Landfill Site Settlement Workshop #2

Date: **Thursday, October 3, 2019 - 8:30 a.m. to 3 p.m.:**
Location: **Sound Transit, 401 S. Jackson**
Room: 625 Building, Floor 2, Downtown Room

Meeting objective(s):

- Review brainstormed solutions from Operations and Maintenance Facility South (OMF South) Landfill Site Settlement Workshop #1;
- Share evaluation process and initial results of brainstormed settlement design concepts;
- Understand collective perspectives around design concepts; and
- Outline plan for designs to continue to pursue

Review in advance of meeting:

- Landfill Site Settlement Workshop #1 Summary
- Settlement Design Concepts Evaluation Matrix Template

Time	Agenda item	Lead
8:30 a.m.	**Introductions and expectations** • Agenda review - • Workshop Summary #1 review, (as needed) corrections and/or clarifications from workshop • Overview of materials available	Erin Taylor
	Erin Taylor welcomed the group and expressed appreciation for their participation. She asked attendees to identify whether or not they were present at the first workshop and led the group in a round of introductions. Attendees committed to the The group committed to the following ground rules for the workshop: • Be present (phones) • Listen • Speak from intentions (not entrenched positions) • Offer space to everyone to speak • Remember: we are unlikely to solve everything today, but we are setting a course/path forward together **Erin** then provided an overview of the agenda for the workshop.	
8:55 a.m.	**Safety Moment**	*Paul Bennett*
	Paul Bennett *offered safety/evacuation information for being in Sound Transit offices.*	
9:00 a.m.	**Sound Transit status updates** • Other ongoing evaluation of priority concerns • Forest Street facility additional detail	Curvie Hawkins Paul Bennett Gwen McCullough

Erin introduced this section of the agenda and informed the group that Sound Transit would provide updates about other ongoing evaluation and address inquires posed in the first workshop related to the existing Forest Street OMF.

Gwen McCullough shared that in addition to the settlement analysis, the Sound Transit team is also working to address health and safety and regulatory areas of priority concern for the Midway Landfill site.

Paul Bennett explained that the Forest Street facility was not built on a landfill site and is not congruent to the Midway Landfill site, even though it is also built on a fill area. He clarified that there will be a section in the report dedicated to the Forest Street piece that illustrates this from a geotechnical borings perspective.

- Tony D.: Could Sound Transit share information about the type of fill present and used on the Forest Street site?
    - **Paul** explained that this information would be included in the report.

Curvie Hawkins shared that the OMF South and Tacoma Dome Link Extension teams would be conducting outreach in November as a "project update to the community." The intent of this engagement is to remind the community of the project(s) status, and ongoing technical work.

- Mark H.: How will Sound Transit reach the communities in November?
    - **Curvie** explained it will be similar to past outreach periods—will do a postcard mailer and jurisdictional coordination in combination with other relevant project outreach efforts (e.g. FWLE open houses in November).

9:20 a.m. **Additional status updates (if needed)**

- City of Kent
- SPU
- City of Federal Way
- WSDOT

Jeff N. (Seattle Public Utilities) shared SPU is doing a great deal of regulatory work with Ecology and EPA for FWLE waste removal. He believes lessons learned from this process will inform how the Midway Landfill site could be remediated.

Tony D. (City of Federal Way) shared that the most recent City Council meeting was pretty contentious and highlighted community confusion about the two potential OMF South sites in Federal Way.

Philip H. (WSDOT) added WSDOT is still working steadily on the FWLE project.

9:40 a.m. **Work progress since Workshop #1** Thomas Mudayankavil *Dave Peters*

- Evaluation process recap for brainstormed concepts
- Review of evaluation criteria

Thomas Mudayankavil and **Dave Peters** explained how the project team evaluated the participants' brainstormed design concepts from the first workshop. Ideas were sorted by type—structural, geotechnical, layout, and excavation—and evaluated by structural, geotechnical and solid waste engineers in each category. For each idea and based on each of the criteria members of the consultant team provided their rating on a scale of 1, 2, 3 with definitions for each. A low risk/green rating was a 3 for this exercise. The tables presented are attached to this summary. This work set the stage for settlement concepts to be developed and then also rated.

9:50 a.m. **Layout optimization conclusions** *Steve Radomski*

Steve Radomski explained how the optimized layout was refined with priority to operational efficiency, and analysis of brainstormed solutions from the first Settlement Workshop. This meant that rather than defining potentially the shallowest areas of fill and placing specific site elements in those locations, the site layout is currently optimized for in/out of and minimization of necessary train movements on a daily basis. Layout refinements and assumptions included:

- Locating the staff parking lot entrance away from S 252nd St, which could have impacted traffic and residents in the adjacent residential area, instead to off SR 99.
- Moved the MOW inside the yard.
- Increased the number of service tracks from 12 to 15 to provide additional wash and training lanes.
- No significant frontage improvements anticipated on SR 99 at the Midway Landfill site.
- Mitigating disruption to the detention pond on the landfill.
- Relocated the landfill gas flare facility to the west side of the detention pond.
- While refining the layout, it became apparent that site was slightly off the landfill. ST consulted Board motion language which stated to build mostly on the landfill, so additional need for some property in vicinity of SR 99 ROW is not in conflict with Board direction.

Steve reported that the optimized layout is the same for all potential OMF South sites as of now, with an eye toward operational efficiency. The optimized layout assumes the OMF is built on stable ground.

- Jeff N.: How many staff in MOW?
    - **Steve:** Currently planning 100 employee parking spaces for MOW; 207 parking spaces for maintenance folks. A little more than 400 employees per shift.

- Tony D.: How can we consult this information after the meeting?
    - **Paul:** This is all real time information. All information shared today will be in the final report.

- Hui (Hugh) Y.: Why do we have the heaviest facility on I-5 (deeper section of the landfill) vs. SR 99 (shallower section of the landfill)?
    - **Steve:** The current rectangle is the ideal shape – we resized the overall perimeter. Run around track is a little under a mile in length—big facility. Within the yard, LRV run at 7 mph on average. Time halfway around the site is about 5 minutes; 5 x 144 cars, 2x day – 25 hours per day in getting vehicle out of the yard. Costs would be incurred in mileage on the vehicles and maintenance staff time if we reoriented the facility.

Paul explained that the "dog leg" brainstormed concept was sketched for illustrative purposes, but determined it would impede operational efficiency, and widens the footprint. The ability to run service is impacted because there's no efficient way to charge the line or maintain the trains, and therefore not cost effective. **Curvie** added, this configuration would also push impacts off the landfill, in conflict with public feedback and the Sound Transit Board's direction.

10:30 a.m.	*Break*	
10:45 a.m.	**Settlement design concepts analysis** • Review brainstormed settlement concepts, by category *Structural and Substructure* *Geotech* *Excavation* • Current working settlement concepts	Erin Taylor Thomas Mudayankavil Dave Peters

Thomas and **Dave** then took the group through each remaining brainstormed design concept category: structural and substructure, geotechnical and excavation. After highlighting examples in each category, workshop participants were prompted to ask clarifying questions. [See Brainstormed Settlement Concepts handouts for the basis of discussion].

Structural

- Jeff N.: Did you compare each brainstormed structural concept to one to one another?
    - **Dave:** No, we did not. Each brainstormed structural concept is compared to the cost and time projections of the ST3 schedule.
- Mark J.: Is property acquisition part of this cost?
    - **Dave:** No, just purely construction. We did look at preliminary estimates for property acquisition in Phase 1 so we have extremely rough number.

- Tony D.: Wil all this background analysis be summarized in report?
    - **Paul:** Yes. There will be a formal comment period on the 10% design.
- Hui (Hugh) Y: Why is “Constructability” on 9 green?
    - **Dave:** Item 9 was the concept developed in Phase 1, so we looked at a 30 ft thick slab. The diameter shaft and was similar to FWLE guideway on the landfill, so we believe it’s more feasible.

Excavation

Ian Sutton shared some rough calculations about the impact of excavating the full landfill—it would require significant truck trips (18 trucks total, 3 trucks loading on the site at a time; 10-hour days), which would result in significant construction delays. This would require ~10,000+ truck trips. Getting that excavated material to rail would require some sort of construction of a transfer facility, which takes additional time to permit and construct.

Jeff N. commented that the means and methods of excavation and waste removal will inform the regulatory and schedule components of evaluation, and the project team agreed.

Geotech

Dave reported that the team was confident they could effectively compact a 30-foot layer. If the strategy was instead to excavate down to minimize settlement, you would have to excavate and then dynamically compact. He shared the team also looked into processing the waste and actually using the processed waste as fill, but there’s still contamination in the material, so it may need to be disposed of despite best efforts to mitigate. Sound Transit’s analysis didn’t try to rank order the brainstormed ideas. In some red boxes, it’s a no-go, in others it’s a hurdle we can work through.

Hui (Hugh) Y. shared one potential blind spot: the structural solution had 10 ideas, some were overall/ some were detailed. Recognize potential for piles. 10 foot diameter shaft, 90 foot down – if you created steel casing, it would significantly increase cost.

- Paul D.**:** Do you have a good summary page of how you got to red/yellow/green?
    - **Dave:** See “Factors considered for ranking”, which is reflective of what engineers were thinking when we ranked it. We don’t have granularity yet to drill down to months over 2026 opening, for example. The number of truck trips, haul distance all contributed to an estimated number of years beyond 2026 required. In summary, all of these brainstormed ideas would require additional time beyond 2026 complete. Sound Transit partnered Geotech efforts with City of Kent report, and we’re working in conjunction with them on geotechnical analysis.

Sound Transit asked attendees whether or not an explanation of the layout refinement should be included in the final report. Attendees agreed it should be included to demonstrate that the brainstormed ideas were looked at. Several of the ideas were incorporated into the optimized layouts.

Design concepts

Sound Transit introduced the five potential design concepts based on the brainstormed ideas from the first workshop. Discussion is generally directed specifically to each design concept.

Jeff N. reminded the group that there's a 24-hour landfill gas system, which is something that needs to be considered in all potential options moving forward.

1. **High structural platform on drilled shafts with no excavation.**
    a. Same as Phase 1 option.
    b. Minimum impact to landfill CAP → a goal, we accounted for potential to impact regulatory component in case we disturb the CAP too much.
    c. 3 ft. thick slab, supported by 10 ft. diameter shafts
    d. Require elevated guideway to connect
    e. Approx. 70,000 CY of excavation (augured)

2. **Low structural platform with some excavation**
    a. Remove and replace CAP
    b. Works with at-grade FWLE tracks – starts to work better with FWLE
    c. 1.7 million CY (in place); 2.7 million CY (loose) excavation required.
    d. No imported material

Discussion:

- Mark H.: Does the estimate of "tens of thousands" of truck trips (20 CY per truck) account for the cap material, or just solid waste?
    - **Thomas:** Haven't gotten to that level of detail yet, but 2-3 feet above the cap in some places/ 14 feet in others.
- **Paul**: we don't typically go down to 100 foot radius on tracks. DCM is 500 foot radius.
- There's room to optimize elevation in this option, could go up or down.
- Tony D. Would #1 or #2 work better for FWLE design assumptions?
    - **Thomas:** #2 would require less effort on FWLE part; #1 would require significant increase in FWLE elevation. This elevation is set to optimize tie-in to FWLE. FWLE will be operational in 2024 – we would want to have those sections completed before 2024 so we don't impact the opening of that line, or need to accommodate construction once the extension is operational.

3. Hybrid 1: Excavation with ground improvements (buildings on shafts)

  a. Remove and replace Cap
  b. Works with at-grade FWLE tracks
  c. Requires over-excavation and backfill
  d. Deep dynamic compaction – 40 foot max.
  e. Landfill excavation: 3.0 million CY (in-place), 4.8 million CY (loose)
  f. Imported material: 1.6 million CY (in-place), 2.6 million CY (loose)

Discussion:

- Potential operation noise reduction if you're down lower, rather than elevated.
- Jeff N.: Is there concern for settlement on buildings? Would deep dynamic compaction eliminate settlement risk in this option?
  - **Dave:** Yes, a bit. Assume excavation and deep dynamic compaction to get to a density that's acceptable to mitigate settlement. We would get benefit for placing backfill for preload. Solid waste weight of removed waste would likely be heavier than backfill. We would hope to improve this enough to avoid settlement.
- Hui (Hugh) Y.: Is building on piles because you expect some degree of settlement even with deep dynamic compaction?
  - **Thomas**: Yes, buildings are the heaviest part. You might not have to put them on piles, but we're being conservative. Buildings would weigh an estimated 5,000-7,000 kips.

4. Hybrid 2: Excavation with ground improvements (slab on grade for tracks and buildings on piles)

  a. Remove and replace CAP
  b. Works with at-grade FWLE tracks
  c. Slab on grade to minimize settlement
  d. Requires over-excavation and backfill
  e. Deep dynamic compaction – 40 ft. max.
  f. Landfill excavation: 3.0 million CY (in-place), 4.8 million CY (loose)
  g. Imported material: 1.6 million CY (in-place), 2.6 million CY (loose)

Discussion:

- Hui (Hugh) Y.: Concern about building on piles because of uneven surface risk as a result of settlement underneath piles. May want to refine that piece.

5. Full excavation and backfill with competent soils

  a. Works with at-grade FWLE tracks
  b. Landfill excavation: 5.0 million CY (in-place), 8.0 million CY (loose)
    i. Quantity removed and taken away is 8.0 million
  c. Imported material: 2.9 million CY (in-place), 4.6 million CY (loose)

Discussion:

- **Dave:** Advantage is that, after complete excavation, ground settlement, legal risk, regulatory risk, employee health and safety are totally mitigated with this issue.
- **Thomas and Ian:** Superfund designation is a result of groundwater condemnation. This means there are limitations on how much of the cap can be exposed at any given time. Given rainy seasons here, we can't have significant amount uncovered at any given time. Have to work during dry season, only 20-22 weeks of actual excavation time per year, which would take approximately 16 years. Limits you to assume include: 5-ish acres open at any given time; trucks would load up (3 at a time); 18 trucks on the road at any given time that would need to travel 20-ish miles. When considering 400,000 truck trips loaded on local roads—estimated 400,000 truck trips to empty landfill; 200,000 to backfill. Hauling to a railhead and tipping fees in OR/WA-- $650 million cost estimate.
  - **Paul:** To be direct, ST can't get permission from WSDOT for direct access to I-5 and we would need to use local roads. We assume Kent may have a concern about this and therefore potential support of the site alternative.
    - Mark H.: Good question to think about, it might. The City of Kent's preference would be for direct access to I-5 and avoid traffic on local roads.
    - Philip H.: We could look into WSDOT permission, but it's not something that's typically granted.
  - Tony D.: Could ST get direct access to I-5 if FWLE tracks are already in place?
    - **Paul:** Just north of the OMFS potential site, there is an elevated alignment. Could excavate under private property. Not a fatal flaw, but something ST is thinking about.
  - Jeff N. We're 300 miles from a landfill with capacity. It would require a transfer facility—nearest existing one is at Black River.
- Not fatal flaw: If we worked double shifts, 6 days/week, we might be able to reduce time by 7-8 years. Maybe we can up the LRV delivery to 6 per week, from 3 per week, to ramp up 2024 delivery more quickly.
- Jeff N.: So far associated with the FWLE contractor discussions, we understand in that area that the fill is up to 70% soil in the landfill by volume. Going to get rusted things, plastics and wood. This means solid waste from excavation is greatly reduced. 8 million CY loose, maybe looking at 2 million CY?
  - This evaluation is from deeper zone of the landfill, not sure what it's like in shallower sections.
  - If you sift through everything and remove solid waste, the dirt is still contaminated. I could see benefit if Ecology would let you put the dirt back.
  - SPU is doing this analysis in real time right now with Ecology—and determining if it might be possible to put dirt back. This will require an amendment to cleanup action plan and consent decree, which will be out for comment in November. Regulatory approach will be available within a week or two; Sound Transit, due to separation of projects, will want to wait to

expand on this concept until it's in public domain. We might have a soil contamination determined before 10% design (Spring 2020).

  - Settlement risk and landfill gas issues are gone if fully excavate. Not trying to clean it up, just trying to get MSW out and approval for competent soils.
  - Except for the middle section, landfill is largely dewatered now. Where you would be working in groundwater, assume it's contaminated and would need to be treated.
  - With other hybrid options, would be nowhere near groundwater area.
  - Gross excavation is somewhere 188,000 CY or 200,000 CY. In terms of scale, significant difference
  - Important data point: production rates on cleanout. SPU thinks estimates is 3-4 months.
- Mark J.: Shannon Wilson is doing Geotech data—maybe could get ahold of it?
- **Paul:** This changes the remedy from removing the cap to fully eradicating the landfill. Could have significant regulatory impacts. We'll be having conversation with Ecology in a couple months.
- Tony D. expressed concern that Hybrid 1 and 2 are too similar, so it might make sense to take two more different options into the design phase.

12:00 p.m.	*Lunch on own*	All
1:00 p.m.	**Comparing the settlement concepts** • What do we take into design?	Erin Taylor and all

Dave explained the Brainstormed Settlement Design Concepts: Summary handout. Different expertise evaluated each category on the summary sheet, which is why the criteria is repeated for each category. Cost is red for each design concept because it is assumed that all options will have a higher cost than the ST3-approved project. A key factor informing the color of bars in this risk analysis is the level of unknowns. You can only know so much.

- Hui (Hugh) Y.**:** 160 foot shafts are significant length for deep foundation elements. Not similar to slab on grade. What's the on-center distance on 10-foot shafts?
  - **Dave:** 700 feet.

- Jeff N.: Sound Transit expects there to be a learning curve on expedited permitting process for FWLE, which is heartening for this process.

- Why is Hybrid 1 and 2 risk different (Hybrid 1 = yellow/ Hybrid 2 = red) for structural and maintenance and reliability?
  - **Thomas**: Different number of construction sequences. Construction schedule will be dictated by time-sensitive elements. More construction in Hybrid 2 – 40-50 acres of concrete slab. Don't want to cast a slab until we're sure it's not going anywhere, so there's levels of cost and time with additional structures built.

Maintainability is also different between the two Hybrid options. Trade-off – more time built into the schedule/construction sequence before can cast the slab. There's a little more flexibility with the piles.

- Tony D.: How does this risk profile compare to the other two sites? Are the FW sites all green? Not talking same alternatives, but still dealing with soil conditions. Are the unknowns that much less at the other sites vs. this one?
    - **DAVE**: Don't have geotechnical borings in the Federal Way area. We've identified areas to do borings along the alignment and near the site. City of Federal Way will receive permits this month so we can do borings in the ROW. Will have to do this same analysis for the 10% design.

Erin then asked the group to highlight any potential blind spots:

Blind spots:

- Paul D..: Would prefer to have Hybrid 1 and 2 as well as full excavation compared to the cleanup happening on FWLE (e.g. Hybrid 1 with waste/soil sifting AND Hybrid 1 comparison).
- Tony D.: Is there a risk with doing FWLE and OMF South projects at the same time? (e.g. excavating significantly next to already-laid track)?
    - **Paul:** This is a real potential.
- Hui (Hugh) Y.: Alternative to Hybrid 2: Consider slab with ground improvement below to limit differential settlement with grouting ports to re-stabilize solid slab. Perhaps optimization of Hybrid 2 option. Might need a cap before you can place the slab option.
- Is Number 1 still an option with an at-grade FWLE?
    - **Paul:** Preference would be to determine if options 2-5 are feasible, then remove option 1. Conversation with Ecology and EPA would happen after final report of this workshop series.
- Mark H.: When will the fall report be ready?
    - **Gwen:** End of November. Goal is to have a final report of the Settlement Workshop series in the next 30-45 days. 10% design analysis for some of these options start tomorrow. **Paul:** In April 2020, we'll be doing cost estimating and value engineering, then constructability.
- Jeff N.: Look at FWLE lessons-learned, even though on a significantly smaller scale, and see how Option 5 could work. Would like an out for Option 5 depending on regulators' input and conversation with FWLE development.

Erin walked the group through an exercise to see what could be removed from further consideration or modified. The result of this conversation is attached to this summary, highlighting group agreements on what to carry forward and next steps. Sound Transit shared their agreement with the current set of settlement concepts to continue moving forward.

2:30 p.m.	**Attendee reflections**	Erin Taylor

	Next steps *Meeting 3: Sound Transit communicates concepts will be taken into the design as reflected in Draft EIS*	
3:00 p.m.	• Adjourn	All

1.0 Introduction

1.1 Purpose

The Midway Landfill is currently being evaluated as one of three site alternatives in the Draft Environmental Impact Statement (EIS) for the Sound Transit Operations and Maintenance Facility South (OMF South) Project. The subsurface development of the OMF South on a landfill will require unique design considerations to maintain the in-place remedial environmental controls and protect the facility against settlement. The landfill specific design considerations are not present at the other OMF South site alternatives. Five landfill subsurface construction design options (options) are currently being explored, as described in Section 1.2. This memorandum provides a high-level, interim assessment of landfill site preparation requirements based on existing data and reasonable assumptions to compare and contrast the five options to inform the Sound Transit decision-making process when advancing options further into the siting evaluation process.

1.2 Five Landfill Subsurface Construction Design Options

Each of the five OMF South subsurface construction design options generally has the same horizontal layout and surface features. The five options primarily vary in subgrade and foundation concepts. The five options include:

1. High Platform – High Structural Platform with No Excavation
2. Low Platform – Low Structural Platform with Some Excavation
3. Hybrid 1 – Excavation with Ground Improvements (Buildings on Drilled Shafts)
4. Hybrid 2 – Excavation with Ground Improvements (Slab on Grade for Tracks and Buildings on Drilled Shaft)
5. Full Excavation – Full Excavation and Backfill with Competent Soils

The options are consistent with those described in the Midway Landfill Site Engineering Optimization Report. Exhibits 4-3 through 4-7 from the report have been included as Figures 1-1 through 1-5 to illustrate each concept. The report should be reviewed for more detail pertaining to the OMF South project and each construction approach.

2.0 Construction Evaluation

The construction evaluation is a high-level discussion of landfill subsurface construction design options pertaining to the Midway Landfill site alternative for the OMF South Draft EIS. The discussion is based on operations and maintenance requirements, available information, and reasonable assumptions intended to develop a planning-level comparison among the five landfill options. As the redevelopment designs are progressed, assumptions are expected to be refined to create a more accurate assessment of landfill preparation requirements.

The discussion presents possible subsurface design options to the work in an effort to develop a planning-level estimate of earthwork and structural requirements, traffic impacts, cost, and schedule related to the landfill preparation required prior to OMF South and associated track construction. Assumptions and influencing factors may vary depending on construction contractor means and methods and regulatory requirements.

2.1 Earthwork Process

Materials anticipated to be encountered during landfill excavation include clean cover soil, landfill closure geosynthetic materials, and refuse material. Clean cover soil can be temporarily stored onsite for reuse during the OMF South construction. Closure geosynthetics and refuse material excavated will require either:

1. Export and disposal offsite,
2. Relocation onsite, or
3. Onsite material screening to retain competent soils for reuse onsite and export of deleterious materials for disposal offsite.

Using the Federal Way Link Extension (FWLE) screening approach as a guide, it is conservatively assumed that material screening will result in 50% of the landfill material reused onsite and 50% exported for disposal (FWLE assumed 70% of screened landfill material can be reused onsite [a published report is not available for reference]). This assumption will be reevaluated in the final report based on the recommendations from the geotechnical investigation of the landfill after borings are conducted at a later date. The reusable material will be contaminated and require environmental controls during handling to avoid contamination of clean material and surface water. The reuse of the material will require oversite by a geotechnical engineer to ensure proper mixing and placement for acceptable soil stability. During placement, some reuse material may be deemed unsuitable and require disposal offsite.

The Low Platform approach reuses excavated material without screening. This approach is intended to balance cut and fill quantities and reduce export requirements. The reused material is not required to be structurally competent since the Low Platform approach relies on drilled shafts for support.

Even though there is a quantity of clean cover material on the site, the amount is unknown. Based on the high-level nature of this evaluation and the proportionately larger quantity of refuse material, the entire excavation quantity calculated by the landfill site engineering optimization is assumed to be refuse. A quantity of clean cover material has not been distinguished from the bulk quantities.

The Preliminary Geotechnical Engineering Services Report Revised, by GeoEngineers, estimates the average in-place material density of the landfill is 120 pounds per cubic foot (lb/cf), or 1.62 tons per cubic yard (ton/cy). The loosening of material during the excavation process is assumed to result in an average loose material density after excavation of 100 lb/cf, or 1.35 ton/cy. This loose material conversion is an approximate factor of 1.2, which is different from the 1.6 assumed by the landfill site engineering optimization. The lower factor is being used based on the age and type of material expected to be encountered. Future geotechnical investigations are expected to refine these values.

Active excavation and hauling are assumed to be 12 hours per day (hr/day), 6 days per week (day/wk). The actual workday may be 16 hours with two shifts. Due to general inefficiencies, breaks, fueling and maintenance, irregularities at the start and finish of shifts, and other potential operational impacts, 12 hours of active hauling was assumed to be the average.

Excavation into refuse is assumed to be permitted only between May 1 and September 30, which excludes wet season construction. This results in a construction season of approximately 22 weeks each year. The construction season is assumed to be limited to reduce the amount of precipitation that may contact refuse and become contaminated water that could potentially infiltrate into the open area of the landfill, further contributing to contaminated groundwater that exists at the site. It is assumed that regulatory agencies will prohibit or restrict open landfill excavation during the wet season to protect against groundwater contamination.

Due to the irregular nature of the material typically found within a landfill, there will be the potential to encounter unexpected subsurface conditions during the excavation process. It is assumed that the construction contractor will be required to have resources available to manage irregular materials encountered during bulk excavation and redirect the work effort without delays to the project timeline. The assumed limited work area in comparison to the total site work area supports the reasonableness of this assumption.

2.2 Drilled Shaft and Slab Installation

Four of the five construction options for landfill preparation include drilled shaft and slab elements – the exception being the Full Excavation approach. The drilled shafts are assumed to be 10 feet in diameter, distributed throughout the building footprints and potentially the full extent of the track area on a 50-foot by 100-foot grid. The grid spacing has changed from the previous 100-foot by 100-foot grid assumed during the landfill optimization process. The assumed slab thickness did not change. The change is a result of design progression.

Shaft installation generally consists of a casing, reinforcement, and concrete embedded through the landfill approximately 15 feet into native, competent material. Shafts will support a structurally suspended concrete slab, approximately 3 feet thick. Hybrid 2 also includes a concrete slab on grade for the track area, without drilled shafts.

Shaft and slab installation are assumed to occur in coordination with the earthwork process, with similar material hauling hours and work season. The work will be phased in with the earthwork, with shafts installed in exposed refuse areas prior to landfill closure cover installation and clean backfill. Shafts through refuse will need to be booted through the replacement landfill closure cover to create a sealed system. Slab installation should be permitted to occur during the wet season, since this work will be performed in a completed landfill closure area without exposed refuse. Drill shaft installation may be permitted during the wet season based on a small and controllable work area pertaining to the individual shafts.

Refuse exhumed during drilling has been included in the earthwork quantities. The drilling process is assumed to be prohibitive to material screening and reuse of the exhumed material, requiring export for disposal. Concrete import is accounted for as an import quantity associated with the shafts and slabs.

2.3 Environment Considerations during Construction

As stated above, wet season construction is assumed to be prohibited during landfill preparation due to the greater potential to generate contaminated groundwater through penetrations through the existing landfill closure system. This restriction results in a May 1 to September 30 work window each year.

In general, the exposed refuse area of the work site is assumed to be limited to 5 acres in size. A specific allowable exposed refuse area size has yet to be established with the regulators. The 5-acre area was assumed as a reasonable size to perform work while managing environmental protection and preservation of the landfill environmental controls. It is assumed that a construction contractor will be able to secure (cover and manage stormwater) a 5-acre exposed area at the end of each day and in anticipation of inclement weather. The construction contractor will also need to control dust on dry and windy days. Precipitation and surface water run-on will need to be managed in the exposed refuse area to prevent water contamination and infiltration into the landfill that could result in further contamination of groundwater. Water collected within the open refuse area will need to be hauled offsite and disposed of as wastewater. It is assumed that some inclement weather will occur, which will increase the schedule duration by 5%.

It is also assumed that a 5-acre open refuse area can be managed without negatively impacting the active landfill gas (LFG) system at the landfill. The LFG collection and conveyance system will be required to remain active during construction to prevent offsite migration of LFG. During the construction, the LFG system will need to be continuously reconfigured to maintain effectiveness. Portions of the system will need to be demolished and replaced as the work progresses through the site. Additionally, the system will need to be managed to prevent air intake, from the open refuse area, that could contribute to a landfill fire.

If material screening will take place for onsite reuse of contaminated, competent backfill material, 5 acres may not be an adequate exposed refuse work area to accommodate continuous excavation, vehicle loading, screening, stockpiling, and backfill of material. The depth of excavation and layback of slopes will also factor into area requirements. If the horizontal footprint of the open refuse area is limited to 5 acres, the available work area within the excavation, or excavation floor, will be reduced in size based on depth and the space consumed by the sideslopes required for a stable excavation. Sideslopes could range from 1:1 (horizontal to vertical) to 2:1. It may be possible to use a non-open refuse area on the site for material processing and handling; however, the area would have to be set up to manage the contamination and protect clean areas.

Note that reuse of the screened material onsite will be subject to regulatory approval. Environmental regulators may require any exhumed refuse to be disposed of at a permitted facility meeting current standards without the option to reuse onsite. The FWLE project has been allowed to reuse refuse material onsite; however, the quality of that material is better understood and the scale of that work is significantly smaller than that proposed for OMF South.

The hauling of contaminated material will be in fully enclosed intermodal containers. If material is determined to be hazardous, hauling requirements will need to be verified based on the material.

Vehicles and equipment driving through a contaminated area will likely need to cross a wheel wash as they exit the area to clean the tires and avoid tracking contaminated material elsewhere onsite and offsite.

Each of the five options will result in refuse retained onsite, which will require the preservation, or reinstallation, of a permanent landfill closure cover system, LFG system, and groundwater monitoring system. The Full Excavation approach may be able to remove LFG-generating material through screening; however, contaminated soil may still result in contaminated soil vapor that will need management.

2.4 Disposal Considerations

Excavated material exported from the landfill will require disposal at a regulated facility, assumed to be a Subtitle D landfill in accordance with the Resource Conservation and Recovery Act (RCRA). Within the Pacific Northwest, it is expected that three solid waste firms have the available landfill capacity for the disposal of the material quantities required. Export disposal quantities are discussed in Section 2.7. The Full Excavation approach requires the most disposal export, at approximately 4 million tons.

The firms include Republic Services, Waste Management, and Waste Connections. The three firms each operate a regional landfill that is accessible by rail. Table 2-1 is based on the King County 2019 Comprehensive Solid Waste Management Plan and provides information on each landfill.

TABLE 2-1
Regional Disposal Capacity

Landfill	Location	Owner	Permitted Capacity (tons)	Remaining Capacity (tons, 2016)
Roosevelt Regional Landfill	Klickitat County, WA	Republic Services	244,600,000	120,000,000
Columbia Ridge Landfill and Recycling Center	Gilliam County, OR	Waste Management	345,275,000	329,000,000
Finley Buttes Regional Landfill	Morrow County, OR	Waste Connections	158,9000,000	131,000,000

The travel distance to these landfills warrants container shipment by rail. Trucks leaving the Midway Landfill will need to go to an intermodal facility for container offload onto trains. At the facility, the trucks will be reloaded with empty containers.

A number of intermodal facilities exist in the Seattle area that are owned by either a solid waste firm or a railroad. The two primary railroads are Burlington Northern Santa Fe Railroad (BNSF) and Union Pacific Railroad (UP).

The intermodal facility is expected to handle an export truck arriving every 2.5 minutes on average. It is assumed that one or multiple existing intermodal facilities in South Seattle will be able to accommodate the exported quantities from Midway Landfill. This may or may not be possible, considering the large quantity and schedule requirements, and a project-specific intermodal facility may be required or, at a minimum, an existing facility may require expansion. It is also assumed that the rail service provider can meet the train capacity requirements.

Based on an intermodal facility located in Seattle, the travel distance will be 20 miles, one way, requiring an assumed 40 minutes each direction. The queue, unload, and load time required at the intermodal facility is assumed to be 10 minutes.

Weighing of containers is assumed to occur at the intermodal facility or disposal landfill.

It is expected that the export disposal will be contracted through the construction contractor, with the solid waste firm as a subcontractor. The railroad component is expected to be a second-tier subcontractor through the solid waste firm. Due to the complexity of the solid waste handling and disposal component of the project, including the potential intermodal facility construct aspect, the bidding for this service under all the options is expected to require at least 6 months.

2.5 Construction Phasing and Material Reuse

As discussed in Section 2.3, construction phasing will be required to maintain the environmental controls at the landfill. A limited portion of the landfill will be allowed to be exposed at one time. Within this exposed refuse area, a number of activities are expected to occur simultaneously, depending on the construction approach, each activity will be in sequence after the preceding activity with the preceding activity moving on to the next area. The exposed refuse area would be able to advance once the landfill cover is reinstalled in the previous work area. Activities may include different combinations of the following.

1. Disassembly/removal and temporary reinstallation of the LFG system
2. Removal of the landfill cover system
3. Excavation of refuse material
4. Screening of refuse material
5. Export of screened unsuitable material
6. Dynamic compaction of the subgrade (if applicable)
7. Placement and compaction of screened competent reuse material
8. Drilled shaft installation (if applicable)
9. Installation of permanent landfill cover system and LFG system
10. Import and installation of competent material
11. Slab installation (if applicable)

The assumed 5-acre open refuse area will be very limiting for the space demands and to maintain efficiencies. Phasing will be further complicated with greater excavation depth requirements and the space consumption from layback slopes. There may be some relief if truck load-out and screening can be performed outside the open refuse area; however, this will create additional contamination areas to manage. Detailed construction phase planning is beyond the scope of this document.

The phased nature of the work allows the construction contractor to be able to respond to changed conditions by moving to another portion of the site, as needed, without greatly impacting schedule. This also provides the opportunity to effectively plan and execute preparatory and sequential work.

Also, the landfill preparation work can be performed concurrently with portions of the OMF South building and track construction. OMF South building and track construction can begin in areas that have achieved final grade or completion of the slab work.

2.6 Truck Trips – Export and Import

2.6.1 Disposal Export

Excavated material for export offsite is assumed to be loaded into 20-foot intermodal containers on waiting trucks. The intermodal containers will be limited to a capacity of 30 tons due to roadway load restrictions set by local agencies and the Washington State Department of Transportation. The containers will be transported offsite for direct load onto railcars at an intermodal facility.

The 5-acre open refuse area is assumed to be able to accommodate four active truck load-out locations, with an onsite load time of 10 minutes each. The number of load-out stations will depend on construction contractor means and methods to perform the work. Four stations were assumed as a possible number based on space limitations and competing work activities. This and other assumptions can be explored in accordance with the next steps described in Section 8.0.

Based on the discussion of intermodal facilities, total round-trip time for a truck will be 100 minutes. Each load station at the Midway Landfill will be able to accommodate up to 10 trucks, for a total of 40 export trucks operating during peak time.

Based on a 12-hour workday, each truck is assumed to make seven trips per day. At 40 operating trucks, this equates to 280 truck trips per day. This is an approximate value that does not account for irregularity at the beginning and end of the day.

2.6.2 Soil Import

Importing soil for backfill will need to be performed separately from the export operation for excavated refuse. There is not expected to an opportunity to gain efficiency from export trucks returning to the site with imported soil. The export trucks will use intermodal containers. The intermodal containers are used for transfer to and from the trains and are not suited for dumping import soil onsite if the containers were loaded with clean import soil on the return trip. Import trucks will need to be dump trucks with trailers with an assumed capacity of 20 cubic yards (cy).

The total round-trip time for import trucks is assumed to be 100 minutes. This assumption is based on a hypothetical material supply location in Maple Valley, Washington. When onsite, trucks will dump either in the fill area or at a stockpile location.

The demand for import material will be less than the export effort, based on assumptions pertaining to excavation screening and reusable material. The total amount of import trucks is assumed to be equally distributed throughout the export duration.

2.6.3 Concrete Import

Concrete import for shafts and slabs is assumed to arrive in 9-cubic-yard truckloads. The import is assumed to be equally distributed throughout the landfill preparation. Concrete will be locally sourced from an unknown location and is expected to be imported following the same site-access requirements as other import and export operations.

2.7 Results

The assumptions discussed above are summarized below.

Assumptions:

1. Average in-place density is 120 lb/cf, or 1.62 ton/cy
2. Average loose (post-excavation) density is 100 lb/cf, or 1.35 ton/cy
3. 50% reusable excavated material
4. Active excavation is 12 hr/day, 6 day/wk, 22 weeks per year (wk/yr)
5. Exposed refuse area is 5 acres
6. Inclement weather will increase the project duration by 5%
7. A 5-acre area can load 4 trucks at a time
8. Each truck is onsite for 10 minutes
9. Truck travel distance is 20 miles each way
10. Truck trip time each direction is 40 minutes
11. Truck time at the offsite facility is 10 minutes
12. Total truck trip time is 100 minutes per load
13. Export trucks operating per load area is 10
14. Total export trucks operating is 40
15. Export trips per day per truck is 7
16. Export truck trips per day is 280

17. Export truck capacity is 30 tons
18. Soil import truck capacity is 20 cubic yards
19. Concrete import truck capacity is 9 cubic yards

Applying these assumptions and the quantities developed during the landfill site engineering optimization to the five landfill options results in the landfill preparation requirements summarized in Table 2-2 and Table 2-3.

TABLE 2-2
Landfill Preparation Material Requirements

Construction Design Option	In-Place Excavation (cy)	Excavation (ton)	Material Export (ton)	In-Place Fill (cy)	In-Place Reuse (cy)	In-Place Import (cy)	Concrete Import (cy)
High Platform	100,000	162,000	135,000	0	0	0	200,000
Low Platform	460,000	745,200	67,500	410,000	410,000	0	180,000
Hybrid 1	2,900,000	4,698,000	3,105,000	1,700,000	600,000	1,100,000	160,000
Hybrid 2	2,900,000	4,698,000	1,957,500	1,700,000	1,450,000	250,000	8,000
Full Excavation	5,300,000	8,586,000	3,915,000	4,000,000	2,400,000	1,600,000	0

The in-place excavation volume was converted to excavation tonnage to be consistent with the industry approach to material export and disposal. In-place volume remains applicable to the assessment for import materials.

TABLE 2-3
Landfill Preparation Hauling Requirements

Construction Design Option	Export Truck Trips per Day	Soil Import Truck Trips per Day	Concrete Import Truck Trips per Day	Total Truck Trips per Day
High Platform	13	0	26	39
Low Platform	7	0	11	18
Hybrid 1	280	179	0	459
Hybrid 2	280	64	10	354
Full Excavation	280	206	0	486

The High Platform and Low Platform export and import truck trips are equally dispersed over the schedule durations for shaft and slab installation.

Hybrid 1, Hybrid 2, and Full Excavation options have landfill preparation schedules dominated by refuse export hauling durations. Soil import trucks have been equally dispersed over the required export period. Concrete import trucks have been dispersed over the concrete work period, if applicable.

Truck trips include only bulk earthwork and concrete. Other vehicle trips (i.e., landfill closure system materials and concrete reinforcement) have not been evaluated. Complete construction traffic will be evaluated as part of the Draft EIS.

3.0 Traffic Analysis

3.1 Truck Haul Routes

Access to and from the site for inbound and outbound trucks is assumed to be via right turns. No left turns into or out of the site are assumed. Left turns would increase the likelihood of onsite or offsite queueing of vehicles causing congestion. Outbound trucks exiting the site would travel north on SR 99 and access I-5 via Kent-Des Moines Road (SR 516). Inbound trucks would travel on I-5, exiting at S 272nd Street. The inbound trucks would travel westbound on S 272nd Street to SR 99, where they would turn north and travel to the site. Excavation export is assumed to be to the north to reach an intermodal facility. Trucks importing material would follow the same routes in the vicinity of the site, although the assumed origin for import concrete and soil material is unknown.

Assumed construction haul routes to the north are shown on Figure 3-1. Actual traffic routes will need to be established for the construction through coordination with the local jurisdiction permit process.

3.2 Level of Service Considerations

Trucks would traverse the haul routes during the entirety of the assumed 12-hour daily hauling period, including both directions during AM and PM peak. As described in Section 2.6, the maximum number of export trucks operating at the site is 40, each performing 7 round trips per day, for a total of 280 daily truck trips. With 280 truck trips during the daily construction period, the average number of truck trips per hour is 23-24. Trucks are assumed to be accessing the site at uniform intervals throughout the daily hauling period, with some potential for irregularity or bunching at the beginning and end of the day. Import trucks represent fewer truck trips than the maximum assumed export truck trips. Given that the daily truck trip volume is estimated to increase by about 206 trips per day to facilitate importing material for the Full Excavation option, it is estimated that 18 additional trucks would be operating at the site each hour. The other construction options also include import of concrete and soil material, but they would require fewer truck trips than the Full Excavation approach. They would range between 1 and 16 additional trucks per hour.

Given their size and slower operating speeds, trucks were assigned a passenger car equivalency (PCE) value of 2.5 for this evaluation. Additionally, each round trip includes an outbound and inbound segment, resulting in a total of 700 PCE daily trips in the study area associated with export activity (280 truck trips x 2.5 PCE). Import activity would result in nearly 515 PCE daily trips in the study area (206 truck trips x 2.5 PCE).

To estimate traffic operation impacts, the truck trips are assumed to be distributed evenly throughout the day and are based on the ability of the yard and the receiving facility to process the trucks. These assumptions are outlined in Section 2 of this memorandum. The 2.5 PCE factor is applied to the truck volume to give planners information about the number of new trips that would need to be accommodated along the truck routes. Below, Table 3-1 outlines the number of peak hour trucks and associated PCEs for each construction scenario.

TABLE 3-1
Passenger Car Equivalency for Each Approach

Construction Design Option	Daily			Hourly			Hourly PCE		
	Export	**Import**	**Total**	**Export**	**Import**	**Total**	**Export**	**Import**	**Total**
High Platform	13	26	39	2	3	4	5	8	13
Low Platform	7	11	18	1	1	2	3	3	6
Hybrid 1	280	179	459	24	15	39	60	38	98
Hybrid 2	280	74	354	24	7	31	60	18	78
Full Excavation	280	206	486	24	18	42	60	45	105

The PCEs shown in the table would be the same for exiting and entering the site during the peak hour. The highest-impact approach would be the Full Excavation approach, with 105 PCE.

As shown in Figures 3-2 and 3-3, Google Maps reports almost all sections of the haul routes operate at “good” or “fair” conditions during both peak periods (typical traffic on Wednesdays at 7 AM and 5 PM was used to represent the AM and PM peak periods, respectively). The exceptions are northbound SR 99 approaching Kent-Des Moines Road during the 8 AM time period and the eastbound segment of Kent-Des Moines Road at the northbound I-5 on-ramp, which operate at “poor” conditions during the AM peak period, as does the I-5 mainline. If 100 to 105 additional PCE vehicles join the backup congestion on the I-5 northbound ramp during peak hours, congestion on Kent-Des Moines Road and possibly onto SR 99 would likely occur. Dispersing the export associated with High Platform and Low Platform options over the shaft installation duration could avoid significant degradation of the operating conditions. Hybrid 2 may how some degradation of the operating conditions. Some example strategies to reduce impacts to local traffic could include: use multiple routes; limit truck activity during the peak traffic hours; and change the end point location to be south.

Given the good or fair operating conditions for other segments of the haul routes, it is assumed that the additional 105 hourly PCE trips for each route would not result in significant degradation to the operating conditions in these areas.

Trucks would enter and exit the site via SR 99. When trucks exit the facility and merge into traffic on SR 99, they would operate at slower speeds due to heavy loads. Returning trucks would also slow down to make the turn into the facility causing minor delays. In order to reduce potential impacts to mainline traffic on SR 99 at the access point, a short acceleration lane could be constructed to accommodate outbound trucks and a short deceleration lane could be constructed to accommodate inbound trucks.
